Package quantities Powder tins containing 50 g.

Further information Nil.

Product licence number 0208/5006.

SECADERM® SALVE

Presentation A green, translucent ointment with the odour of phenol, terebene and melaleuca oil. It contains:

Resin BP	26.0% w/w
Turpentine Oil BP	6.00% w/w

1100

RORER PHARMACEUTICALS

Melaleuca Oil BPC (1949)	5.60% w/w
Terebene	5.25% w/w
Phenol BP	2.40% w/w

Warning: Keep out of the reach of children.

Pharmaceutical precautions Store in a cool

Legal category GSL.

Uses Indicated in the relief and treatment of boils, abscesses, whitlow, bunions and chilblains.

Package quantities Tubes containing 15 g.

Dosage and administration For external use only.

Further information Nil.

Apply once or twice daily to the affected parts and cover with a light dressing of gauze.

Product licence number 0208/5007.

Contra-indications, warnings, etc No side-effects reported.

** Trade Mark*

ACTINAC*

Presentation Actinac is presented as a pale yellow dry powder, together with a solvent for the preparation of a lotion. Each gram of powder contains:

chloramphenicol BP	40 mg
hydrocortisone Acetate BP	40 mg
utoxyethyl nicotinate	24 mg
llantoin	24 mg
recipitated Sulphur BPC	320 mg

The solvent is Purified Water BP, containing an approved preservative perfume and bacteriostat.

Uses Actinac is for use in the topical treatment of acne vulgaris and other acneiform conditions. It is formulated to control local infection and suppress inflammation with consequent scarring effects.

Dosage and administration The lotion should be prepared according to the manufacturer's literature and applied with cotton wool or lint night and morning for the first four days and only at night thereafter. In order to prevent recurrence, treatment should be continued for three nights after the lesions have disappeared.

Contra-indications, warnings, etc Actinac is contra-indicated in patients who have a known hypersensitivity to any of the ingredients.

Avoid Actinac coming into contact with the eyes and mouth.

Early in the course of treatment, erythema may occur at the site of application and the patient may experience sensation of warmth due to the vasodilator action of the nicotinate. In the unlikely event of a severe reaction, the patient is instructed to consult the doctor before further use of Actinac.

In pregnant animals, administration of corticosteroids can cause abnormalities of foetal development. The relevance of this finding to human beings has not been established. However, topical steroids should not be used extensively in pregnancy, i.e. in large amounts or for long periods. It is advisable to remove jewellery before applying the lotion.

Pharmaceutical precautions Store cool. The lotion when constituted will remain active for 21 days. Any portion remaining after this time must be discarded and a fresh supply of lotion prepared.

Legal category POM.

Package quantities Each pack of Actinac contains two bottles of powder (each 5 g), two bottles of solvent (each 16 ml) and an instruction leaflet for the patient.

Further information Nil.

Product licence number 0109/0037.

ALTACITE*

Presentation Altacite is available as white, buttermint-

flavoured tablets marked 'altacite' and 'ROUSSEL', and as an aqueous suspension, slightly off-white, viscous and flavoured with peppermint.

Each tablet and each 5 ml of suspension contains 500 mg of hydrotalcite.

Uses Antacid, buffering in the optimum range of pH 3-5 for over two hours.

Altacite is indicated for symptomatic relief in the following conditions: peptic ulceration; dyspepsia; hyperacidity; gastritis; heartburn, especially when associated with reflux oesophagitis or hiatus hernia, and heartburn in pregnancy.

Dosage and administration *Adults:* 2 tablets or 10 ml of suspension between meals and at bedtime or as directed by a physician.

Children (6-12 years): Half the adult dose.

The tablets should be chewed or crushed before swallowing.

Contra-indications, warnings, etc There are no contra-indications to Altacite but it is probably wise to avoid any drug, including antacids, during the first trimester of pregnancy. As with other compounds containing aluminium or magnesium, Altacite may reduce intestinal absorption of tetracycline. Side-effects are uncommon. Diarrhoea and vomiting have been reported but have ceased on withdrawal of therapy.

Pharmaceutical precautions Store in a cool place.

Legal category P.

Package quantities *Altacite Tablets:* Carton of 12 blister strips each containing 10 tablets.

Altacite Suspension: Polypropylene bottle containing 500 ml.

Further information There is no evidence of absorption of Altacite in man. Investigations in healthy human volunteers have shown no elevation of serum aluminium or magnesium levels on administering Altacite at therapeutic dosage for a continuous period of 28 days.

The sodium content of Altacite is 0.22 mmol per tablet or 5 ml of suspension.

Product licence numbers

Altacite Tablets	0109/0040
Altacite Suspension	0109/0041

ALTACITE PLUS*

Presentation *Suspension:* Viscous, slightly off-white aqueous suspension, flavoured with spearmint. Each 5 ml of suspension contains 500 mg of hydrotalcite and 125 mg of activated dimethicone.

Tablets: Round, white to off-white peppermint flavoured tablets marked R364 on one side and  on the reverse. Each tablet contains 500 mg hydrotalcite and 250 mg activated dimethicone.

Uses Altacite Plus has antacid, mucosal protective and anti-flatulent properties. As an antacid, Altacite Plus buffers in the optimal range of pH 3-5 for over two hours.

It is indicated for symptomatic relief in the following conditions: dyspepsia; flatulence and abdominal distension; hyperacidity; gastritis; peptic ulceration; heartburn, especially when associated with oesophagitis or hiatus hernia, and heartburn in pregnancy.

Dosage and administration *Adults*: 10 ml suspension or 2 tablets between meals and at bedtime or as directed by the physician.

Children: (8-12 years): Half the adult dose.

The tablets should be chewed or crushed before swallowing.

Contra-indications, warnings, etc There are no known contra-indications to Altacite Plus, but it is probably wise to avoid any drug, including antacids, during the first trimester of pregnancy. As with other compounds containing aluminium or magnesium, Altacite Plus may reduce intestinal absorption of tetracycline. Side-effects are uncommon. Diarrhoea and vomiting have been reported but have ceased on withdrawal of therapy.

Pharmaceutical precautions Store in a cool, dry place.

Legal category P.

Package quantities *Altacite Plus Suspension*: Polypropylene bottle containing 500 ml.

Altacite Plus Tablets: Carton of five polypropylene tubes, each tube containing 20 tablets.

Further information There is no evidence of absorption of hydrotalcite in man. Investigations in healthy human volunteers have shown no elevation of serum aluminium or magnesium levels on administration of hydrotalcite at therapeutic dosage for a continuous period of 28 days.

The sodium content of Altacite Plus suspension is 0.078 mmol/5 ml and of Altacite Plus tablets 0.046 mmol/tablet.

Product licence numbers

Altacite Plus Suspension	0109/0062
Altacite Plus Tablets	0109/0056.

CIDOMYCIN® GENTAMICIN INJECTION BP GENTAMICIN INTRATHECAL INJECTION GENTAMICIN SULPHATE BP

Presentation Cidomycin for parenteral use is available as:

Cidomycin Injectable in 2 ml vials or ampoules each containing the equivalent of 80 mg gentamicin base as sulphate.

Cidomycin Injectable Paediatric in 2 ml vials each containing the equivalent of 20 mg gentamicin base as sulphate.

Cidomycin Intrathecal Injectable in 1 ml ampoules each containing 5 mg gentamicin base as sulphate.

Cidomycin Sterile Powder is whitish in colour and is available in packs of 1 g (base activity).

Uses Gentamicin is an aminoglycoside antibiotic with broad-spectrum bactericidal activity. It is usually active against most strains of the following organisms: *Escherichia coli*, *Klebsiella spp.*, *Proteus spp.* (indole positive and indole negative), *Pseudomonas aeruginosa*, staphylococci, *Enterobacter spp.*, *Citrobacter spp.* and *Providencia spp.*

Gentamicin injection and gentamicin paediatric injection are indicated in urinary-tract infections, chest infections, bacteraemia, septicaemia, infections following burns, infected traumatic or surgical wounds and other systemic infections due to sensitive organisms.

Gentamicin intrathecal injection is indicated as supplement to systemic therapy in bacterial meningitis, ventriculitis and other bacterial infections of the central nervous system.

Gentamicin sterile powder prepared as a steril injection may be used for serious intra-ocular infection and prophylactically prior to intra-ocular surgery.

Dosage and administration *Gentamicin injection* *Adults: Serious infections*: If renal function is not impaired, 5 mg/kg daily in divided doses at six- or eight hourly intervals. The total daily dose may be subsequently increased or decreased as clinically indicated.

Systemic infections: 80 mg eight-hourly for 7-10 days is usually an effective dose. If body weight is less than 60 kg, 60 mg eight hourly should be used.

Urinary-tract infections: As 'systemic infections'. Or, if renal function is not impaired, 160 mg once daily may be used.

Children: Up to 2 weeks of age: 3 mg/kg 12-hourly.

2 weeks to 12 years: 2 mg/kg eight-hourly.

Assay of peak serum levels gives confirmation of adequacy of dosage and also serves to detect levels above 10 mg/l, at which the possibility of ototoxicity should be considered.

Gentamicin is excreted by simple glomerular filtration and therefore is given in reduced dosage in cases of renal impairment. The following table may be useful when treating adults.

Blood urea		Creatinine clearance (GFR)	Dose and frequency of administration
(mg/100 ml)	(mmol/l)		
<40	6-7	>70	80 mg 8-hourly
40-100	6-17	30-70	80 mg 12-hourly
100-200	17-34	10-30	80 mg* daily
>200	>34	5-10	80 mg* every 48 hours
Twice-weekly intermittent haemodialysis		<5	80 mg* after dialysis

*60 mg if body weight <60 kg. Frequency of dosage in hours may also be approximated as serum creatinine (mg%) $\times$ eight or in SI units, as serum creatinine (mmol/l) divided by 11. If these dosage guides are used peak serum levels must be measured. Peak levels of gentamicin occur approximately one hour after intra-muscular injection and 15 minutes after bolus intravenous injection. Trough levels are measured just prior to the next injection.

The recommended dose and precautions for intramuscular and intravenous administration are identical. Gentamicin when given intravenously should be injected

irectly into a vein or into the drip set tubing over no less than three minutes. If administered by infusion, this should be over no longer than 20 minutes and in no greater volume of fluid than 100 ml.

Gentamicin intrathecal injection: Bacterial meningitis and ventriculitis: the starting dose of gentamicin intrathecal injection for both children and adults is 1 mg daily, intrathecally or intraventricularly, together with 1 mg/kg every eight hours intramuscularly. The MIC of the infecting organism in the CSF should be assessed and, if necessary, the intrathecal/intraventricular dose increased to 5 mg daily, whilst keeping the intramuscular dose at 1 mg/kg eight-hourly. Treatment should be continued for at least seven days but longer if necessary. Periodic serum and CSF gentamicin assays should be carried out to ensure that adequate antibiotic levels are maintained and that serum and CSF levels do not exceed 0 mg/l.

Gentamicin sterile powder: Serious bacterial ocular infections and prophylaxis prior to intra-ocular surgery: gentamicin sulphate equivalent to 20–40 mg base should be injected subconjunctivally once or twice daily until infection subsides. This may require continuation of therapy for two or more days. In the majority of cases concomitant intramuscular therapy is not required. This dosage regime is suitable for children and adults.

Contra-indications, warnings, etc Gentamicin should not be used to treat infections during the first trimester of pregnancy, except when the clinician deems it advisable as in life-threatening infections. Neither should it be used if there is a history of sensitivity to the antibiotic. Ototoxicity in the form of vestibular damage hearing loss has seldom been manifest) has been recorded following the use of gentamicin. In most cases it occurred in the presence of impaired renal function following higher dosage or more prolonged administration than that recommended. In some patients with impaired renal function there has been a transient rise in blood-urea-nitrogen which has usually reverted to normal during or following cessation of therapy. It is important to adjust the frequency of dosage according to the degree of renal function (see table).

There is evidence that any potential nephrotoxicity of cephalosporins, and in particular of cephaloridine, may be increased in the presence of gentamicin. Consequently if this combination is used monitoring of kidney function is advised. Concurrent administration of gentamicin and other potentially ototoxic or nephrotoxic drugs should be avoided.

Neuromuscular blockade and respiratory paralysis have been reported from administration of aminoglycosides to patients who have received curare-type muscle relaxants during anaesthesia.

Pharmaceutical precautions Gentamicin is a remarkably stable antibiotic and does not require refrigeration. Avoid freezing.

In general gentamicin injection should not be mixed. In particular the following are incompatible in mixed solution with gentamicin injection: penicillins, cephalosporins, erythromycin, Lipiphysan, heparins, sodium bicarbonate.† Dilution in the body will obviate the danger of physical and chemical incompatibility and enable gentamicin to be given concurrently with the drugs listed above either as a bolus injection into the drip tubing,

Carbon dioxide may be liberated on addition of the two solutions. Normally this will dissolve in the solution but under some circumstances small bubbles may form.

with adequate flushing, or at separate sites. In the case of carbenicillin, administration should only be at a separate site.

Legal category POM.

Package quantities *Cidomycin Injectable:* Packs of 25 × 2 ml vials or ampoules.

Cidomycin Injectable Paediatric: Packs of 5 × 2 ml vials.

Cidomycin Intrathecal Injectable: Packs of 5 × 1 ml ampoules.

Cidomycin Sterile Powder: Bottles containing 1 g.

Further information Nil.

CIDOMYCIN* (TOPICAL)

Presentation Available as a white cream which contains gentamicin sulphate in a water-miscible base and as a translucent ointment in a petroleum base. Each gram of ointment or cream contains gentamicin sulphate equivalent to 3 mg gentamicin base.

Uses Cidomycin is a wide-spectrum antibiotic and the ointment and cream are recommended for the treatment of primary and secondary skin infections due to susceptible bacteria.

Primary infections: Impetigo contagiosa, superficial folliculitis, ecthyma, furunculosis, sycosis barbae and pyoderma gangrenosum.

Secondary infections: Infected, contact, seborrhoeic, and eczematoid dermatitis, pustular acne, infected burns and wounds, ulcers and paronychia.

Dosage and administration A small amount of ointment or cream should be applied to the lesions three or four times daily or as prescribed. If necessary this may be covered with a dressing.

Contra-indications, warnings, etc Cidomycin is contra-indicated when there is a known hypersensitivity to any ingredient of the preparation.

Precautions: If irritation, sensitisation or super-infection develop, treatment with Cidomycin should be discontinued and appropriate therapy instituted.

Pharmaceutical precautions Store cool. In order to preserve their antibacterial activity Cidomycin Cream and Ointment should not be diluted by the addition of excipient.

Legal category POM.

Package quantities *Cidomycin cream:* Tubes of 15 g and 30 g.

Cidomycin ointment: Tubes of 15 g and 30 g.

Further information Nil.

Cidomycin Ointment	0109/5064

CLAFORAN* ▼

Presentation Claforan is available in vials containing 500 mg, 1 g or 2 g of cefotaxime as cefotaxime sodium.

Claforan is a white to slightly creamy powder which, when dissolved in Water for Injections BP forms a straw coloured solution suitable for intravenous or intramuscular administration. Variations in the intensity of colour of the freshly prepared solution do not indicate change in potency or safety.

Uses

Properties: Claforan is a broad spectrum bactericidal cephalosporin antibiotic. Claforan is exceptionally active in vitro against Gram-negative organisms sensitive or resistant to first or second generation cephalosporins. It is similar to other cephalosporins in activity against Gram-positive bacteria.

Indications: Claforan is indicated in the treatment of the following infections either before the infecting organism has been identified or when caused by bacteria of established sensitivity.

Septicaemia

Respiratory tract infections: acute and chronic bronchitis, bacterial pneumonia, infected bronchiectasis, lung abscess and post-operative chest infections.

Urinary tract infections: acute and chronic pyelonephritis, cystitis and asymptomatic bacteriuria.

Soft tissue infections: cellulitis, peritonitis and wound infections.

Bone and joint infections: osteomyelitis, septic arthritis.

Obstetric and gynaecological infections: pelvic inflammatory disease.

Gonorrhoea: particularly if penicillin-resistant.

Other bacterial infections: meningitis and other sensitive infections suitable for parenteral antibiotic therapy.

Bacteriology: The following organisms have shown in vitro sensitivity to Claforan.

Gram-positive: Staphylococci, including coagulase-positive, coagulase-negative and penicillinase-producing strains. Beta-haemolytic and other streptococci such as *Streptococcus mitis* (*viridans*). Many strains of enterococci, e.g. *Streptococcus faecalis*, are relatively resistant. *Streptococcus* (*Diplococcus*) *pneumoniae*. *Clostridium* spp.

Gram-negative: *Escherichia coli*
Haemophilus influenzae including ampicillin-resistant strains

Klebsiella spp.

Proteus spp. both indole-positive and indole-negative

Enterobacter spp.

Neisseria spp. including β -lactamase producing strains of *N. gonorrhoeae*

Salmonella spp. including *Salm. typhi*

Shigella spp.

Providencia spp.

Serratia spp.

Citrobacter spp.

Claforan has frequently exhibited useful in vitro activity against *Pseudomonas* and *Bacteroides* species although some strains of *Bacteroides fragilis* are resistant.

There is in vitro evidence of synergy between Claforan and aminoglycoside antibiotics such as gentamicin against some species of Gram-negative bacteria including some strains of *Pseudomonas*. No in vitro antagonism has been noted. In severe infections caused by *Pseudomonas* spp. the concurrent use of an aminoglycoside antibiotic may be indicated.

Dosage and administration Claforan may be administered intravenously or intramuscularly. Dosage, route

and frequency of administration should be determined by severity of infection, sensitivity of causative organism and condition of the patient. Therapy may be started before the result of sensitivity tests are known.

Adults: The recommended dosage for moderate infections is 1 g every 12 hours (twice daily). However dosage may be varied according to the severity of the infection, sensitivity of causative organisms and condition of the patient.

In severe infections the recommended dosage may be increased up to 12 g daily given in 3 or 4 divided doses. For infections caused by sensitive *Pseudomonas* spp. daily doses of more than 6 g are usually required.

Children: The usual dosage is 100–150 mg/kg/day in 2 to 4 divided doses. In very severe infections up to 200 mg/kg/day, in divided doses, may be required.

Neonates: The recommended dosage is 50 mg/kg/day in 2 to 4 divided doses. In severe infections, 150–200 mg/kg/day, in divided doses, have been given.

Dosage in gonorrhoea: A single injection of 1 g should be administered intramuscularly or intravenously.

Dosage in renal impairment: Because of extra-renal elimination, it is only necessary to reduce the dosage of Claforan in severe renal failure (GFR < 5 ml/min). After an initial loading dose of 1 g, the daily dose should be halved without change in the frequency of dosing, e.g. 1 g 12 hourly becomes 0.5 g 12 hourly, 1 g 8 hourly becomes 0.5 g 8 hourly, 2 g 8 hourly becomes 1 g 8 hourly, etc. As in all other patients, dosage may require further adjustment according to the course of the infection and the general condition of the patient.

Intravenous and intramuscular administration: Dissolve Claforan in Water for Injections BP as shown below. Shake well until dissolved and then withdraw the entire contents of the vial into the syringe and use immediately.

Vial size	Volume of Water for Injections to be added
500 mg	2 ml
1 g	4 ml
2 g	10 ml

Intravenous infusion: Claforan may be administered by intravenous infusion. 1–2 g are dissolved in 40–100 ml of Water for Injections BP or in the infusion fluids listed under Pharmaceutical precautions. The prepared infusion should be administered over 20–60 minutes.

Contra-indications, warnings, etc

Contra-indications: Known allergy to cephalosporins.

Precautions: Cephalosporin antibiotics may usually be given safely to patients who are hypersensitive to penicillins, although cross reactions have been reported. Special care is indicated in patients who have had an anaphylactic response to penicillin.

Patients with severe renal dysfunction – see 'Dosage and administration'.

Cephalosporin antibiotics at high dosage should be given with caution to patients receiving aminoglycoside antibiotics or potent diuretics such as frusemide as these combinations are thought to have an adverse effect on renal function. However, at the recommended doses, enhancement of nephrotoxicity is unlikely to be a problem with Claforan.

Interference with laboratory tests: A false-positive reaction to glucose may occur with reducing substances but not with the use of specific glucose oxidase methods.

Pregnancy: Although studies in animals have not shown an adverse effect on the developing foetus, the safety of claforan in human pregnancy has not been established. Consequently, claforan should not be administered during pregnancy especially during the first trimester, without carefully weighing the expected benefits against the possible risks.

Lactation: Claforan is excreted in the milk.

Side effects: Adverse reactions to claforan have occurred relatively infrequently and have generally been mild and transient. Effects reported include diarrhoea, candidiasis, rashes, fever, eosinophilia, leukopenia and transient rises in liver transaminase and alkaline phosphatase.

Transient pain may be experienced at the site of injection. This is more likely to occur with higher doses. Occasionally, phlebitis has been reported in patients receiving intravenous claforan. However, this has rarely been a cause for discontinuation of treatment.

Overdosage: Serum levels of claforan may be reduced by peritoneal dialysis or haemodialysis.

Pharmaceutical precautions The dry powder in vials should be stored away from heat and protected from light. Whilst it is preferable to use only freshly prepared solutions for both intravenous and intramuscular injection, claforan is compatible with several commonly used intravenous infusion fluids and will retain satisfactory potency for up to 24 hours refrigerated in the following:

Water for Injections BP
Sodium Chloride Injection BP
5% Dextrose Injection BP
Dextrose and Sodium Chloride Injection BP
Compound Sodium Lactate Injection BP (Ringer-Lactate Injection).

After 24 hours any unused solution should be discarded.

Claforan is also compatible with 1% lignocaine. Freshly prepared solutions should be used.

Some increase in colour of prepared solutions may occur on storage. However, provided the recommended storage conditions are observed, this does not indicate change in potency or safety.

Legal category POM.

Package quantities Individually packed vials containing 500 mg or 1 g cefotaxime as cefotaxime sodium for use by intramuscular or intravenous injection) in packs of 10.

Individually packed vials containing 2 g cefotaxime as cefotaxime sodium (for intravenous use only) in packs of 10.

Further information Each gram of claforan contains approximately 48 mg (2.09 mmol) of sodium. Claforan has been used with other beta-lactam antibiotics such as carbenicillin in the treatment of neutropenic patients. Claforan may also be administered separately with metronidazole in the treatment of mixed infections caused by anaerobic and aerobic organisms.

Claforan usually passes the blood-brain barrier in levels above the MIC of common sensitive pathogens when the meninges are inflamed.

The laboratory abbreviation for cefotaxime is CTX.

Product licence number 0109/0074

LANITOP®

Presentation Lanitop tablets contain 0.1 mg digoxin. The tablets are round (6 mm diameter), yellow and with a score line. They are engraved one side with LAN on the left side and TOP on the right side of the breakline.

Lanitop Intravenous Injection contains 0.2 mg digoxin in each 2 ml ampoule.

Uses Lanitop is indicated in all cases in which digitalis therapy is required, e.g. congestive heart failure and certain cardiac arrhythmias, especially atrial fibrillation.

Dosage and administration The dosage of Lanitop is the same whether given orally or i.v. The two routes of administration are therefore interchangeable at any time during treatment.

Dosage is dependent upon the glycoside requirement of the heart in individual patients. It has been shown that 95% of patients may be treated successfully, using the following schedule.

1. **Adults and children over 14:** *Digitalisation:* 2 tablets twice daily (or 2 ampoules i.v. daily if oral administration is impossible) for three to five days.

Maintenance: 1 tablet two or three times daily (or 1–1½ ampoules i.v. daily if oral administration is impossible).

In emergencies a more rapid digitalisation may be achieved by giving: 2 tablets three times daily for two to four days.

If the immediate onset of action is critical, the first dose may be given i.v. (1 ampoule).

If oral administration is impossible rapid digitalisation may be achieved by giving 1 ampoule i.v. three times daily for two to four days.

2. **Infants and children under 14 years:** Digitalisation may be effected by using 0.01 mg/kg repeated six-hourly until therapeutic result is obtained, 2–4 doses usually being sufficient. Maintenance is usually achieved with 0.01 mg/kg daily, which should be adjusted as necessary.

Contra-indications, warnings, etc All cardiac glycosides are contra-indicated in digitalis intoxication, hypercalcaemia and before electro-cardioversion. Special care should be taken if the patient is already receiving or has recently been receiving a cardiac glycoside. In addition, glycoside therapy may be contra-indicated or may require additional therapeutic measures in manifest hypokalaemia, disorders of atrio-ventricular conduction and in pathological bradycardia, depending on its severity.

Parenteral administration of calcium, particularly simultaneously, should be avoided during any glycoside therapy.

Lanitop should be accorded the same precautions as all other cardiac glycosides when administered intravenously.

As with all digitalis therapy, gastric disturbance, arrhythmias and visual disturbances may occur, particularly in those patients who are hypersensitive to glycosides or who have an electrolyte imbalance such as that caused by diuretic therapy.

A reduced glycoside requirement may be expected in the elderly and when there is renal insufficiency. The recommended doses may produce evidence of toxicity in patients with acute myocardial infarction, severe pulmonary disease, advanced liver failure, and in premature infants.

Teratogenic studies have been conducted in animals without adverse effects. However, the likely benefit from the administration of Lanitop should be weighed against possible adverse effects during the first trimester of pregnancy.

Treatment of overdosage: Gastric lavage should be given and the ECG monitored. Potassium should be administered for hypokalaemia and glucose and insulin for hyperkalaemia; atropine for bradycardia, antiarrhythmic agents such as disopyramide or lignocaine for tachycardia and arrhythmia.

Pharmaceutical precautions Store in a cool dry place. Protect from light.

Legal category POM.

Package quantities *Lanitop Tablets*: Bottles of 100.

Lanitop Injection: Boxes of 5 × 2 ml ampoules.

Further information Absorption of Lanitop is rapid (5–20 minutes) and virtually complete. Its duration of action is similar to that of digoxin. These characteristics fulfil the pharmacokinetic requirements of an ideal cardiac glycoside.

The stated dosages are less than those normally used when digoxin is administered. Under steady state conditions 0.3 mg Lanitop daily is therapeutically equivalent to 0.5 mg of digoxin daily.

Lanitop Injection 0109/0054

MOLIPAXIN* ▼

Presentation Molipaxin (trazodone hydrochloride) is available as: Molipaxin 50 mg. Size No. 3, opaque violet/green capsules printed R365B and . Each capsule contains 50 mg trazodone hydrochloride.

Molipaxin 100 mg. Size No. 2, opaque violet/fawn capsules printed R365C and . Each capsule contains 100 mg trazodone hydrochloride.

Uses *Properties:* Molipaxin is a potent antidepressant. It also has anxiety reducing activity. Molipaxin is a triazolopyridine derivative chemically unrelated to known tricyclic, tetracyclic and other antidepressant agents. It has negligible effect on noradrenaline re-uptake mechanisms. Whilst the mode of action of Molipaxin is not known precisely, its antidepressant activity may concern noradrenergic potentiation by mechanisms other than uptake blockade. A central anti-serotonin effect may account for the drug's anxiety reducing properties.

Indications: Relief of symptoms in all types of depression including depression accompanied by anxiety. Symptoms of depression likely to respond in the first week of treatment include depressed mood, insomnia, suicidal thoughts, anxiety, somatic symptoms and hypochondriasis.

Dosage and administration Molipaxin may be administered as a single bedtime dose or in divided doses after food. Symptomatic relief may be seen during the initial week, with optimum antidepressant effects typically evident within two weeks.

Adults: According to severity, treatment should be initiated at 100 or 150 mg per day and then increased to 200 or 300 mg per day, respectively, at the end of the

first week. In exceptionally severe depression, dosage may be further increased to a maximum of 600 mg per day in divided doses. However, the usual maintenance dose in patients with moderate-to-severe depression is 300 mg per day. In cases of mild depression, as seen in general practice, the usual maintenance dose is 200 mg per day.

Sedative effects, although usually well tolerated on continued medication, may suggest administration of, or the major portion of the usual daily doses at bedtime.

In elderly and frail patients the recommended starting dosage is 100 mg per day in divided doses increasing thereafter according to clinical progress. In general, single doses above 100 mg should be avoided in these patients.

In conformity with current psychiatric opinion, it is suggested that Molipaxin be continued for several months after remission. Cessation of Molipaxin treatment should be gradual.

Children: There are insufficient data to recommend the use of Molipaxin in children.

Contra-indications, warnings, etc

Contra-indications: None.

Precautions: As with all other drugs acting on the central nervous system, patients should be warned against the risks of handling machinery and driving.

Although no untoward effects have been reported, Molipaxin may enhance the effects of muscle relaxants and volatile anaesthetics. Similar considerations apply to combined administration with sedative and antidepressant drugs, including alcohol. Molipaxin has been well tolerated in depressed schizophrenic patients receiving standard phenothiazine therapy and also in depressed parkinsonian patients receiving therapy with levodopa.

Interactions between Molipaxin and monoamine oxidase inhibitors have not been reported. However, on grounds of clinical caution, Molipaxin is not recommended for concurrent administration with monoamine oxidase inhibitors or within two weeks of terminating treatment with these compounds.

Since Molipaxin is only a very weak inhibitor of noradrenaline re-uptake and does not modify the blood pressure response to tyramine, interference with the hypotensive action of guanethidine-like compounds is unlikely. However, studies in laboratory animals suggest that Molipaxin may inhibit most of the acute actions of clonidine. In the case of other types of antihypertensive drug, although no clinical interactions have been reported, the possibility of potentiation should be considered.

Current clinical experience suggests that Molipaxin does not cause seizures. Nevertheless, care should be exercised when administering Molipaxin to patients suffering from epilepsy, avoiding in particular, abrupt increases or decreases in dosage.

Molipaxin should be administered with care in patients with severe hepatic or renal disease.

Pregnancy and lactation: Although studies in animals have not shown any direct teratogenic effect, the safety of Molipaxin in human pregnancy has not been established. On basic principles, therefore, its use during the first trimester should be avoided. The possibility of Molipaxin being excreted in the milk should also be considered in nursing mothers.

Side-effects: Molipaxin is a sedative antidepressant and drowsiness sometimes experienced during the first day of treatment usually disappears on continued therapy.

infected eczema.

ve (non-purulent) and

s.
i.

Dosage and administration *Sofradex Drops: In the ear:* 2 or 3 drops should be instilled into the ear three or four times daily; alternatively, a gauze wick kept saturated with the drops should be inserted into the external auditory meatus.

In the eye: For rapid effect, 1 or 2 drops every one or two hours should be instilled in acute conditions (generally for two, or three days), reducing to 1 or 2 drops three or four times daily.

Sofradex Ointment: In the ear: Sofradex should be applied twice or thrice daily, and especially at bedtime, to the meatus, concha or over the pinna and to adjacent skin areas if extension to these parts has occurred.

In the eye: 2 or 3 applications of the ointment daily, or at bedtime if drops have been used during the day.

Contra-indications, warnings, etc Sofradex is contra-indicated in: herpes simplex infections and other virus diseases of the cornea and conjunctiva; tuberculosis of the eye; fungal diseases of the eye; trachoma.

Purulent infections of the eye could be masked and indeed enhanced by the presence of the steroid, particularly when the infecting organism is not sensitive to the antibiotics contained in Sofradex.

Hypersensitivity to any of the active ingredients.

Preparations containing framycetin should not be used for treating otitis externa when the ear drum is perforated, because of the risk of ototoxicity.

Side effects:

1. Raised intra-ocular pressure may result from extended use of topical steroid therapy in some individuals.

2. In conditions causing thinning of the cornea, any topical steroid may cause perforation.

3. Cataract has been reported to have occurred after unduly prolonged treatment of eye conditions with topical corticosteroids.

Note:

In pregnant animals, administration of corticosteroids can cause abnormalities of foetal development. The relevance of this finding to human beings has not been established. However, topical corticosteroids should not be used extensively in pregnancy, i.e. in large amounts or for long periods.

Although it is unlikely that infants will be treated long-term with Sofradex, it must be remembered that if steroids are applied to the skin of infants for continued periods of time, there is a risk of adrenal suppression occurring, even without occlusion.

Pharmaceutical precautions Store cool.

Legal category POM.

Package quantities *Sofradex Ear/Eye Drops:* Bottles of 8 ml.

Sofradex Ear/Eye Ointment: Tubes of 5 g (fitted with ophthalmic nozzle).

Further information Nil.

Sofradex Ear/Eye Ointment 0109/0031

SOFRAMYCIN* STERILE EYE DROPS/OINTMENT

Presentation Soframycin is available as a sterile eye ointment and as colourless, sterile eye drops.

Each gram of ointment contains Framycetin Sulphate BP (Soframycin) 5 mg in a sterile, non-irritating greasy base.

Each millilitre of drops contains Framycetin Sulphate BP (Soframycin) 5 mg in a sterile, buffered, isotonic, aqueous solution.

Uses Soframycin is used for the treatment of bacterial infections of the eye, notably conjunctivitis and blepharitis, for styes, corneal abrasions and burns, and prophylactically following the removal of foreign bodies. It is also indicated for corneal ulcers (alone or as a complement to the use of Soframycin by subconjunctival injection).

Dosage and administration *Soframycin Drops:* For rapid effect, preferably during the daytime, 1 or 2 drops every one or two hours should be instilled in acute conditions (generally for two or three days), reducing to 1 or 2 drops three or four times daily.

Soframycin Ointment: For continued effect, 2 or 3 applications of the ointment daily, or at bedtime if drops have been used during the day.

Contra-indications, warnings, etc Soframycin is contra-indicated when there is a known hypersensitivity to any ingredient of the preparation.

Pharmaceutical precautions Store cool.

Legal category POM.

Package quantities *Soframycin Eye Drops:* 8 ml in ophthalmic dispenser.

Soframycin Eye Ointment: Tubes of 5 g (fitted with ophthalmic nozzle).

Further information Nil.

Soframycin Eye Ointment	0109/5041

SOFRA-TULLE*

Presentation Sofra-Tulle is a sterile, lightweight, lanoparaffin gauze dressing impregnated with Framycetin Sulphate BP 1% (Soframycin).

Uses Sofra-Tulle has a wide range of antibacterial activity and is an ideal dressing for immediate use in a variety of infected lesions.

Thermal: Burns, scalds.

Traumatic: Lacerations, abrasions, bites, puncture wounds, crush injuries.

Ulcerative: Varicose, diabetic, decubitus and tropic ulcers.

Elective: Skin grafts (donor and receptor sites), avulsion of finger and/or toe nails, circumcision, suture lines.

Miscellaneous: Secondarily infected skin conditions (e.g. eczema, dermatitis, herpes zoster), colostomy ileostomies, tracheostomies, incised abscesses, incision perionychia.

Dosage and administration If necessary, the lesion should first be cleansed, then a single layer of Sofra-Tulle applied and covered with a suitable dressing. When dressing ulcers, the tulle should be shaped to fit the ulcer crater. If the lesion exudes profusely it is advisable to change the dressings at least once a day.

Contra-indications, warnings, etc Sofra-Tulle is contra-indicated where there is known allergy to lanolin or to Soframycin, or where organisms are known to be resistant to the latter.

Precautions: Cross-sensitisation to Soframycin may occur in patients known to be allergic to Streptomycin derived antibiotics (neomycin, paramomycin, kanamycin).

In most cases, absorption of the antibiotic is negligible. However, where large body areas are involved, e.g. 3rd or more body burn, the possibility of ototoxicity being produced by prolonged applications should be borne in mind.

Pharmaceutical precautions Store cool.

Legal category POM.

Package quantities Cartons of 10 and 50 units; each unit pack contains one sterile antibiotic gauze dressing 10 cm × 10 cm placed between two layers of parchment. Also available as a continuous gauze strip 30 cm × 10 cm packed in cartons of 10 units.

Further information Nil.

Product licence number 0109/5047.

*Trade Mark

A.M.*

BRONCHIAL ANTISPASMODIC SYRUP

Presentation Rybar C.A.M. is a pale-green coloured liquid. Each 5 ml contains:

Ephedrine Hydrochloride BP	4 mg
Butethamate citrate INN	4 mg

Uses C.A.M. is indicated in the symptomatic treatment of bronchospasm in children and adults with asthma or onchitis. C.A.M.'s antitussive action may also be useful in children with unproductive cough.

Dosage and administration *Age under 2 years:* half 5 ml spoonful three times daily.

2-4 years: One 5 ml spoonful three times daily.

Age over 4 years: Two 5 ml spoonful three times daily.

Adults: Four 5 ml spoonful, 3-4 times daily.

Contra-indications, warnings, etc C.A.M. is contra-indicated in children and adults with severe heart disease, hypertension and thyrotoxicosis.

Overdosage: Patients who have taken an overdosage of C.A.M. should have gastric lavage performed within four hours of the overdosage occurring. If overdosage is extreme, or there is delay in removing the drug from the stomach, symptomatic treatment of cardiac or respiratory embarrassment should be considered.

Side-effects: The synergistic action of butethamate citrate with ephedrine hydrochloride allows the dose of ephedrine to be kept low. This means that normal sympathomimetic side-effects, such as nausea, restlessness and sweating, due to overdosage of ephedrine are virtually absent.

Pharmaceutical precautions C.A.M. should not be exposed to bright sunlight, as this may cause the chemical degradation of ephedrine hydrochloride.

Legal category P.

Package quantities C.A.M. is available in bottles of 50 ml and 1 litre.

Further information Nil.

Product licence number 0237/5014.

FOLEX*-350 TABLETS

Presentation Each pink, sugar-coated Folex-350 tablet contains:

Ironous fumarate BP	308 mg (equivalent to 100 mg ferrous iron)
Folic Acid BP	350 mcg

Each pink tablet is overprinted with the word 'Folex-50'.

Uses The prevention and treatment of iron deficiency naemia of pregnancy; the prevention of megaloblastic naemia of pregnancy; nutritional anaemia.

Dosage and administration One tablet a day. In pregnancy it is recommended that Folex-350 should be started at the first ante-natal consultation and continued until 3 months after delivery.

Contra-indications, warnings, etc Folex-350 is contra-indicated in megaloblastic anaemia due to vitamin B₁₂ deficiency.

Overdosage: Patients who have taken an overdosage of Folex-350 should have gastric lavage performed, if possible within four hours of the overdosage occurring. In addition, patients should have such symptomatic treatment as appears necessary. In order to eliminate excess free iron, a chelating agent such as desferrioxamine may be administered.

Side-effects: Side-effects of iron and folic acid preparations which have been reported include nausea, vomiting, gastro-intestinal symptoms, constipation and diarrhoea.

Pharmaceutical precautions No special precautions are required.

Legal category POM.

Package quantities Folex-350 is supplied in containers of 30 (child-resistant), 100, 1000 and 5000 tablets.

Further information The high incidence of iron and folate deficiencies in pregnant women may result in possible obstetrical abnormalities. It is now considered advisable to administer daily iron and folic acid routinely, in one tablet, throughout pregnancy. Folex-350 is the recommended BNF 1978 formulation for combined iron and folic acid preparations used for the prevention of anaemia of pregnancy.

Product licence number 0237/5008.

RYBARVIN* INHALANT

Presentation Rybarvin Inhalant contains:

Atropine Methonitrate BP	0.1% w/v
Papaverine Hydrochloride BP	0.08% w/v
Adrenaline BP	0.4% w/v
Benzocaine BP	0.08% w/v
Saline base to 100%	

Uses Rybarvin is indicated for the symptomatic relief of asthma.

Dosage and administration *Adults:* Rybarvin should be inhaled deeply, using a Rybar Inhaler for one to two minutes three times daily. Further inhalations may be taken at other times to relieve acute asthmatic attack.

Children: The length of inhalation should be reduced to a half to one minute. Inhalations should be taken twice daily in the morning and evening.

In conditions in which there is inflammation of the

bronchial mucous membrane the full effect of Rybarvin may not be obtained, owing to poor absorption of the active ingredients.

Contra-indications, warnings, etc Rybarvin Inhalant is contra-indicated in patients with heart conditions or hypertension.

Pharmaceutical precautions The activity of Rybarvin Inhalant is destroyed by the action of light and metal. It is very important that the specially designed Rybar Inhaler is used by patients using Rybarvin.

Legal category P.

Package quantities Rybarvin is available in 28 ml bottles.

Further information Rybarvin has not been shown to be habit-forming.

The Rybar Inhaler is made of glass and fitted with a rubber bulb so that no metal parts come into contact with Rybarvin Inhalant.

The Rybar Inhaler provides a very fine mist of droplets which enables rapid absorption of the active ingredients from the lungs. Full instructions for the patient are given with each inhaler.

Product licence number 0237/5016.

ELLERGAL*
ELLERGAL* RETARD

Presentation *Bellergal*: Pinkish-brown, coated, round tablets, 5.9–6 mm diameter, weighing 100 mg, branded 'ANDOZ' on one side. Each tablet contains 100 mcg total alkaloids of belladonna, 300 mcg Ergotamine Tartrate PhEur and 20 mg Phenobarbitone PhEur.

ellergal Retard: Speckled yellow, deep pink and brown coated, round tablets, 8.5 mm diameter, convex, 3.7–9 mm thick, weighing 200 mg. Each tablet contains 100 mcg total alkaloids of belladonna, 600 mcg Ergotamine Tartrate PhEur and 40 mg Phenobarbitone PhEur.

Uses *Principal action*: Bellergal blocks excessive stimulation of the autonomic nervous system. The trochanteric action of ergotamine and the anticholinergic action of belladonna effectively suppress the peripheral effects of overstimulation of both sympathetic and parasympathetic divisions. At the same time central sedation with phenobarbitone renders the patient less reactive to mental and emotional stimuli.

Indications: Treatment of a wide range of functional symptoms due to autonomic imbalance, including: menstrual tension, menopausal syndrome and other gynaecological disorders. Some skin disorders, e.g. neurodermatitis. Gastro-intestinal dysfunction. Effort (de Costa's) syndrome (neurocirculatory asthenia). Migraine, interval treatment.

Dosage and administration *Bellergal*: 1 or 2 tablets three times a day.

ellergal Retard: 1 tablet night and morning.

The active principles in Bellergal Retard Tablets are contained in three different-coloured fractions from which they are gradually released at different rates in the gastro-intestinal tract. One tablet morning and evening ensures that an effective therapeutic level is maintained throughout the 24 hours.

Contra-indications, warnings, etc

Contra-indications: Although the quantities of ergotamine and belladonna in Bellergal are small, their presence should be taken into consideration in the treatment of patients suffering from narrow angle glaucoma, paralytic ileus, prostatic enlargement, coronary insufficiency, cardiac failure, obliterative vascular disease, impaired hepatic or renal function and porphyria. Bellergal is contra-indicated during pregnancy and breast feeding.

Precautions: Caution is advised in the presence of angina pectoris.

The possibility of impairment of patient reaction time should be noted and care advised when driving vehicles or operating machinery. Bellergal may potentiate the central effects of alcohol, sedatives, hypnotics, anticholinergics, psychotropic agents and narcotics.

Overdosage: Treatment should be directed to the elimination of the ingested material by emesis and gastric lavage. General supportive measures should be applied

with particular reference to the cardiovascular and respiratory systems. Large phenobarbitone overdoses are very unlikely with these preparations.

Side-effects: Side-effects are rare. They are predictably over-sedation with too high dosage for the individual and very rare instances of skin reactions due to individual idiosyncratic reactions to one or more of the ingredients; most commonly to the phenobarbitone.

Dryness of the mouth and disturbance of vision due to cholinergic blockade may occur.

Pharmaceutical precautions Protect from light.

Legal category POM.

Package quantities *Bellergal*: Containers of 100, 250 and 1,000.

Bellergal Retard: Containers of 100 and 250.

Further information Nil.

Product licence numbers

Bellergal 0101/5019

BRINALDIX*

Presentation White, uncoated, bi-convex tablets, 8 mm diameter, 3.3 mm thick, 200 mg weight branded 'SANDOZ' on one side and with a single break line on the other. Each tablet contains furosemide 20 mg.

Uses *Principal actions*: Brinaldix is an efficient diuretic with a regular, easily controlled action. Pharmacological studies demonstrate that the maximum sodium-excreting effect of furosemide is 25–30% greater than that of chlorothiazide. In man, the maximum effective dose of furosemide has been shown to have a diuretic and sodium-excreting effect over 50% greater than with bendroflumethiazide and a diuretic effect 26% greater than chlorothiazide. The sodium excreting effect in the same trial was 60% higher than chlorothiazide.

The efficient but not precipitate diuresis produced by Brinaldix minimises the risk of severe dehydration and circulatory collapse. The diuretic effect of Brinaldix is predictable and readily controlled. The onset of diuresis is generally within two hours of administration; the maximum diuretic effect is attained in the first three to six hours and the major diuresis is over within 12–24 hours according to dosage.

The urinary excretion of sodium and chloride ions remains in the ratio of approximately 1:1 throughout the dosage range, thus minimising the risk of disturbance to acid/base balance.

The sodium/potassium excretion ratio of Brinaldix is high.

Indications: Oedema of cardiac, renal or hepatic origin. Hypertension.

Dosage and administration *Oedema*: Initial treatment: 2 or 3 tablets daily at breakfast time.

Maintenance: 1 or 2 tablets a day at breakfast time either on consecutive days or intermittently according to the patient's condition or response.

Hypertension: Treatment: 1–2 tablets daily at breakfast time.

Contra-indications, warnings, etc

Contra-indications: Acute glomerulonephritis; severe impairment of renal or hepatic function; hypersensitivity to sulphonamides.

Precautions: Brinaldix should be used with care in patients with diabetes and in patients receiving concurrent antihypertensive therapy. Hypokalaemia (indicated by weakness, muscle cramps, drowsiness, cardiac arrhythmias, gastro-intestinal distension or ileus) may develop in patients likely to be excreting large quantities of potassium in association with high dosage or prolonged continuous diuretic administration, hepatic cirrhosis, aldosteronism, during corticosteroid administration, or during a severely restricted salt intake (below 25 mmol Na⁺ daily). Potassium depletion may result in an increased sensitivity to digitalis, with signs of overdosage. It is recommended that patients be observed for early signs of fluid and electrolyte imbalance. Periodic examination of serum electrolyte levels may be indicated in certain circumstances. In the treatment of established hypokalaemia, the dose of potassium administered should be adjusted to the individual patient's requirements.

Overdosage: Symptoms of overdosage may include thirst, nausea, vomiting, polyuria, hypokalaemia, drowsiness, confusion, hypotension and convulsions. Treatment should be directed to the removal of ingested material by induced emesis or gastric lavage as appropriate. Fluid intake and output should be monitored and measures directed to the restoration of fluid and electrolyte balance. Measures to combat hypotension should be taken if required.

Side-effects: Brinaldix is well tolerated and side-effects are rare. In a small number of patients nausea and headache have been reported, and skin rash has occurred. There are no reports of blood dyscrasias associated with Brinaldix administration. As with thiazide diuretics, Brinaldix may cause a rise in serum uric acid levels. This is likely to be asymptomatic, but an attack of gout may be precipitated. Increase in blood urea, sugar and insulin concentrations have occasionally been reported. The dosage of antidiabetic drugs and/or diet may have to be adjusted in diabetic patients.

Pharmaceutical precautions Nil.

Legal category POM.

Package quantities Containers of 100 tablets.

Further information Nil.

Product licence number 0101/5021.

BRINALDIX* K

Presentation Flat, round, white, effervescent tablets with a rough surface, of 22 mm diameter, 4.25 mm thick and 2.4 g weight. Each effervescent tablet contains 20 mg clopamide, 600 mg Potassium Chloride PhEur and 400 mg Potassium Bicarbonate BPC and provides 470 mg potassium (12 mmol: 12 mEq K⁺), 286 mg

chloride (8 mmol: 8 mEq Cl⁻) and 800 mg anhydro citric acid (787.4 mg citrate ion).

Uses Principal actions: Brinaldix K effervescent tablets provide a unique diuretic/potassium preparation. Brinaldix is an efficient diuretic with a regular, easy controlled action. Pharmacological studies demonstrate that the maximum sodium-excreting effect of clopamide is 25–30% greater than that of chlorothiazide. In man the maximum effective dose of clopamide has been shown to have a diuretic and sodium-excreting effect over 50% greater than with bendrofluzide and a diuretic effect 26% greater than chlorothiazide. The sodium-excreting effect in the same trial was 60% higher than chlorothiazide.

The efficient but not precipitate diuresis produced by Brinaldix minimises the risk of severe dehydration and circulatory collapse. The diuretic effect of Brinaldix is predictable and readily controlled. The onset of diuresis is generally within two hours of administration; the maximum diuretic effect is attained in the first three to six hours and the major diuresis is over within 12–24 hours according to dosage. The urinary excretion of sodium and chloride ions remains in the ratio of approximately 1 : 1 throughout the dosage range, thus minimising the risk of disturbance to acid/base balance. The sodium/potassium excretion ratio of Brinaldix is high.

Brinaldix K effervescent tablets are a unique diuretic/potassium formulation to be taken in water as a palatable drink.

Each effervescent tablet provides 12 mmol K⁺ and 8 mmol Cl⁻ thus reducing the risk of hypokalaemia, hypochloreaemic alkalosis. Enteric-coated diuretic/potassium tablets have been incriminated in the development of small-bowel ulceration and stenosis. The provision of potassium in solution obviates this risk.

Indications: Oedema of cardiac, renal or hepatic origin. Hypertension.

Brinaldix K is particularly suitable for long-term treatment.

Dosage and administration

Oedema: Initial treatment: 2 or 3 effervescent tablets daily dissolved in 60 ml ($\frac{1}{3}$ – $\frac{1}{2}$ a tumblerful) of water at breakfast time.

Maintenance: 1–3 effervescent tablets dissolved in 60 ml ($\frac{1}{3}$ – $\frac{1}{2}$ a tumblerful) of water at breakfast time either on consecutive days or intermittently according to the patient's condition or response.

Hypertension: Treatment: 1–2 effervescent tablets daily dissolved in 60 ml ($\frac{1}{3}$ – $\frac{1}{2}$ a tumblerful) of water at breakfast time.

Contra-indications, warnings, etc

Contra-indications: Acute glomerulonephritis; severe impairment of renal or hepatic function; hypersensitivity to sulphonamides.

Precautions: Brinaldix K should be used with care in patients with diabetes and in patients receiving concurrent antihypertensive therapy. Although the unique effervescent diuretic preparation Brinaldix K has been formulated to limit the occurrence of hypokalaemia (indicated by weakness, muscle cramps, drowsiness, cardiac arrhythmias, gastro-intestinal distension or ileus) the latter may develop in patients likely to be excreting large quantities of potassium in association with high dosage or prolonged continuous diuretic administration, hepatic cirrhosis, aldosteronism, during corticosteroid administration, or during a severely restricted salt intake.

below 25 mmol Na⁺ daily). Potassium depletion may result in an increased sensitivity to digitalis, with signs of overdosage. It is recommended that patients be observed for early signs of fluid and electrolyte imbalance. Periodic determination of serum electrolyte levels may be indicated in certain circumstances. In the treatment of established hypokalaemia, the dose of potassium administered should be adjusted to the individual patient's requirements.

verdosage: Symptoms of overdosage may include first, nausea, vomiting, polyuria, hypokalaemia, drowsiness, confusion, hypotension and convulsions. Treatment should be directed to the removal of ingested material by induced emesis or gastric lavage as appropriate. Fluid intake and output should be monitored and measures directed to the restoration of fluid and electrolyte balance. Measures to combat hypotension should be taken if required. However deliberate overdosage is unlikely with effervescent preparations.

side-effects: Brinaldix is well tolerated and side-effects are rare. In a small number of patients nausea and headache have been reported, and skin rash has occurred. There are no reports of blood dyscrasias associated with Brinaldix administration. As with thiazide diuretics, Brinaldix may cause a rise in serum urate levels. This is likely to be asymptomatic, but an attack of gout may be precipitated. Increase in blood urea, sugar and insulin concentrations have occasionally been reported. The dosage of antidiabetic drugs and/or diet may have to be adjusted in diabetic patients.

pharmaceutical precautions Brinaldix K Tablets are effervescent and should be dispensed in their original containers which carry a note to the patient requesting that the containers be kept tightly closed in a cool dry place.

pharmaceutical category POM.

package quantities Containers of 100 effervescent tablets (5 tubes of 20).

further information Brinaldix K Tablets each contain 37.5 mg sucrose and have an absolute calorific value of 4.5 kJ.

product licence number 0101/5022.

EDILANID*

resenation Cedilanid is available as tablets and injection.

tablets: White, uncoated tablets weighing 85 mg. Flat and of 6 mm diameter with a bevelled edge, coded GO and scored on one side with SANDOZ engraved on the other.

mpoules: 2 ml of Cedilanid Injection contains 400 mcg edlanoside BP.

ses *Principal action:* In common with all cardioactive glycosides of digitalis, Cedilanid improves cardiac function in the failing heart by increasing the force of myocardial contraction and by correcting disturbances of heart rhythm by a direct effect on the excitatory mechanism and the conduction system probably mediated by ion transport mechanisms. The onset of action of Cedilanid is very rapid by the intravenous route, the effect being apparent within 10 minutes and at maximum

in 1½–2 hours. When parenteral therapy is essential and the intravenous route impracticable, Cedilanid may be given intramuscularly. The Cedilanid Ampoule solution does not need dilution before use.

Indications: Acute heart failure. Routine digitalisation and maintenance of the patient in congestive heart failure.

Dosage and administration *Rapid digitalisation:* 800 mcg–1.6 mg intravenously or intramuscularly as a single dose or divided over 24 hours.

Slow digitalisation: Oral administration of 1.5–2 mg daily over a 3–5 day period.

Maintenance: 250 mcg–1.5 mg orally per day as indicated by the patient's requirements.

Children: The rapid digitalising dose is 20 to 40 mcg/kg body weight in a single dose or divided over 24 hours.

Oral maintenance doses are 10–30 mcg/kg body weight in 3 divided doses.

Lower doses should be given to elderly patients and dosage should be reduced in the presence of chronic cor pulmonale, coronary insufficiency, electrolyte disturbances and renal or hepatic insufficiency.

It is particularly important to warn patients stabilised on Cedilanid of the change in appearance of the tablet. Patients at risk i.e. the young, the elderly and those with previous history of a toxic reaction to digitalis glycosides, should be carefully monitored during the changeover period as there is evidence of greater bioavailability of the active ingredient with the new tablet.

Contra-indications, warnings, etc

Contra-indications: Complete AV block and 2nd degree AV block (especially 2 : 1), excessive sinus bradycardia (particularly when associated with Stokes-Adams seizures).

Precautions: Digitalised patients should not be given calcium by parenteral injection. The dose of Cedilanid administered should be adjusted to compensate for any other digitalis preparations administered in the recent past. High dose oral calcium supplements, psychotropic drugs (including lithium) and sympathomimetics should be given with caution to digitalised patients. Potassium depletion sensitises the heart to cardiac glycosides.

Overdosage: Fatalities from ingestion of massive oral doses of Cedilanid are rare because vomiting usually occurs. Common symptoms of overdosage include anorexia, nausea, vomiting, headache, visual disturbances and disorientation. Slow or irregular pulse, fall of blood pressure and a wide range of cardiac arrhythmias and conduction defects have been reported as a result of digitalis toxicity. Death is usually due to ventricular fibrillation and is sometimes preceded by delirium and convulsions. Chronic poisoning by cumulation produces gradual onset of these symptoms.

Treatment: Activated charcoal may reduce absorption. Emesis or gastric lavage within eight hours, to empty the stomach. Check and carefully monitor serum potassium. Correct hypo- or hyperkalaemia. Treat arrhythmias.

Atropine 0.3–0.6 mg will reverse profound bradycardia. A cardiac pacemaker may be required.

Side-effects: Toxic effects occur if the dose of Cedilanid has not been carefully tailored to the specific requirements and tolerance of each individual patient.

The most frequent side-effects noted are: *CNS and gastro-intestinal disturbances:* anorexia, nausea, vomiting; in rare instances (especially in elderly arterioscle-

rotics), confusion, disorientation, aphasia and visual disturbances including chromatopsia.

Cardiac: Disturbances of heart rate, conduction and rhythm (bigeminy), lowering of the S-T segment with preterminal T-wave inversion.

Allergic skin reactions: (Pruritus, urticaria, macular rashes) occur very occasionally.

Pharmaceutical precautions Protect from light.

Legal category POM.

Package quantities *Cedilanid Tablets:* Containers of 100 and 500.

Cedilanid Injection: Boxes of 5 × 2 ml ampoules.

Further information Nil.

Tablets 0101/5025

Ampoules 0101/5005

DIHYDERGOT*

Presentation *Tablets:* Off-white, uncoated, round tablets weighing 100 mg, 6 mm diameter, 2.5–3 mm thick, flat with bevelled edge. Single break line coded OL on one side, branded 'SANDOZ' the other. Each tablet contains 1 mg dihydroergotamine mesylate (equivalent to 860 mcg dihydroergotamine base).

Oral Solution: Clear, colourless solution. Each 1 ml contains 2 mg dihydroergotamine mesylate. The dropper bottle delivers 1 ml (2 mg) per 20 drops.

Ampoules: Clear, colourless solution. Each 1 ml contains 1 mg dihydroergotamine mesylate.

Uses The hydrogenation of ergotamine to dihydroergotamine reduces the uterotonic effect and the pressor effect is modified. Dihyergot contracts hypotonic vessels by stimulation of the alpha-adrenoceptors. It also possesses alpha-adrenergic properties (i.e. it is a partial agonist). Its tonic effect on capacitance vessels is more pronounced than its effect on resistance vessels. This activity results in increased venous tone and prevents excessive venous pooling.

During prolonged oral administration, Dihyergot induces a stabilization of the tone of extracranial vessels and therefore is of value for the prophylactic treatment of the migraine attack. It may be used orally or by injection as an alternative to ergotamine for the symptomatic relief of the migraine attack.

Dihyergot injection is effective in the prophylactic treatment of postoperative deep vein thrombosis. This activity is considerably enhanced by administration in combination with a low-dose heparin regimen. In this way impaired venous return and activation of clotting factors, two conditions contributing to the development of postoperative thrombosis, can be controlled.

Indications: Prophylactic treatment of migraine. May also be used for the symptomatic treatment of the migraine attack.

Prophylactic treatment of postoperative deep vein thrombosis using Dihyergot Injection in conjunction with a low dose heparin regimen.

Dosage and administration *Prevention of migraine:* 1–2 tablets or 10–20 drops of oral solution three times daily reduce the frequency and severity of attacks in most patients.

Treatment of migraine: 2–3 tablets or 20–30 dro repeated half-hourly if necessary, up to a total of tablets or 100 drops per day.

Intramuscular or subcutaneous injection of 1–2 r (1–2 ml) given as soon as the prodromal symptom appear usually aborts the attack within half an hour. the attack is not relieved by this time a further dose m be given.

Prevention of postoperative deep vein thrombosis Inje tion only: Individual injections of Dihyergot 500 m (0.5 ml) with heparin 5000 iu given subcutaneous every 8–12 hours. Treatment is started 1–2 hours bef surgery and continued not less than 6 hours pos operatively. Subsequent doses are given 8–12 hourly f at least 7–10 days depending on the risk of thrombosi

Contra-indications, warnings, etc *Contra-indic tions:* Parenteral administration of Dihyergot is contr indicated in patients suffering from uncontrolled cardi failure, coronary artery disease (see also precautions inadequately controlled hypertension and in pregnanc

Precautions: A small number of patients with corona insufficiency have been treated with twice daily injections of Dihyergot 500 mcg intramuscularly and resting conditions and only in severe coronary disabili were anginal attacks precipitated. However, due to th possibility of increased cardiac filling pressure, great ca should be exercised in treating such patients, and th dose of 500 mcg (0.5 ml) should not be exceeded.

Intra-arterial injection of Dihyergot must be avoide Should this occur by accident an alpha-blocker shou be administered. Caution is indicated where Dihyergo is being given on a long-term basis to patients wi severe renal disease unless they are receiving dialys and for patients with severe liver disease. In such cas the dosage should be reduced.

Concomitant use of the antibiotic triacetyloleandc mycin, which is not available in the UK, or erythromyci and Dihyergot by mouth should be avoided.

When using heparin in combination with Dihyergo Injection the general contra-indications and precautio implicit with the use of heparin should be observe Mean plasma heparin levels have been reported to b higher in patients receiving Dihyergot concurrently.

The tendency to haemorrhage and total intra-operativ and postoperative blood loss in patients on Dihyde got/heparin treatment has been found to be similar t that encountered with low-dose heparin therapy.

Subcutaneous administration may give rise to loca discomfort at the injection site.

Side-effects: Nausea and vomiting may occasionall occur. Following parenteral treatment, numbness an tingling of the fingers and toes as well as precordial pai have been reported in a few cases. With oral use however, such effects are extremely rare.

Pharmaceutical precautions Protect from light. D not dilute the Oral Solution.

Once Ampoule is opened contents should be use immediately. Dihyergot and heparin injections shou be administered individually.

Legal category POM.

Package quantities *Tablets:* Containers of 50.

Oral Solution: Dropper bottles of 15 ml.

Ampoules: Boxes of 5 × 1 ml.

HYDERGINE®

Representation *1.5 mg Tablets:* Hydergine 1.5 mg is available as white, flat, bevel-edged tablets, scored on one side and coded 'ZM', with 'SANDOZ' engraved on the other, and of 240 mg weight, 9 mm diameter and 9 mm thickness. Each tablet contains 1.5 mg Co-Dergocrine Mesylate BP.

4.5 mg Tablets: Hydergine 4.5 mg is available as white, round biconvex tablets coded HYDERGINE in regular form on one side with 4.5 engraved on the other, and of 240 mg weight and 9 mm diameter. Each tablet contains 4.5 mg Co-Dergocrine mesylate BP.

Uses *Principal Actions:* Double-blind controlled clinical trials have demonstrated that Hydergine significantly improves symptoms associated with senile dementia presenting as mild to moderate impairment of mental function in the elderly.

Hydergine improves:

Mental performance—assessed in terms of alertness, recent memory, orientation, relief from confusion.

Motional state—assessed in terms of relief from anxiety, depression, emotional instability and lack of motivation/initiative.

Social behaviour—assessed in terms of improvement in self-care: i.e. decreased difficulty with eating, washing, dressing, walking.

Physical manifestations—assessed in terms of mobility, appetite, dizziness, fatigue.

Hydergine exerts a favourable metabolic effect on cerebral neurones indicated by changes which occur in the EEG in both test animals and patients and by the improvement in mental function after the treatment period.

Studies on brain tissue of hypoxic animals demonstrate that Hydergine conserves adenosine triphosphate, the main energy donor in the cell, by inhibiting the enzymes ATPase and adenylcyclase. It also inhibits phosphodiesterase, the enzyme which takes part in the breakdown of cyclic adenosine monophosphate thus conserving metabolic turnover.

Indications: Symptoms of senile dementia presenting as mild to moderate impairment of mental function in the elderly.

Dosage and administration 1.5 mg three times a day or once daily dosage of 4.5 mg.

The effect of Hydergine is not immediately manifest, improvement in clinical symptoms and EEG patterns not being evident for two to three weeks, continuous improvement being maintained thereafter for at least three months.

Contra-indications, warnings, etc *Contra-indications:* The pharmacological studies and clinical trials with Hydergine do not indicate any contra-indications.

Precautions: Caution should be exercised in the administration of Hydergine to patients with severe bradycardia.

Overdosage: In cases of overdosage, supportive measures are all that are likely to be required.

Side-effects: Side-effects are infrequent following ad-

ministration of Hydergine and even relatively large doses are well tolerated. Minor side-effects including gastrointestinal disturbance, flushes, rashes, nasal stuffiness, abdominal cramps and postural hypotension in hypertensive patients have on occasion been reported.

Pharmaceutical precautions Protect from light.

Legal category POM.

Package quantities *1.5 mg Tablets:* containers of 100.

4.5 mg Tablets: calendar pack of 28.

Further information A patient assessment chart and record cards are available on request to assist the physician in his patient selection for Hydergine.

1.5 mg Tablets	0101/0042
4.5 mg Tablets	0101/0117

MELLERIL®

Presentation *Suspension:* An opaque creamy/white semi-viscous fluid, available in two strengths:

25 mg in 5 ml (0.5%): Each 5 ml spoonful contains 25 mg thioridazine base equivalent to 27.5 mg of thioridazine hydrochloride.

100 mg in 5 ml (2%): Each 5 ml spoonful contains 100 mg thioridazine base equivalent to 110 mg of thioridazine hydrochloride.

Syrup: A clear, orange liquid. Each 5 ml spoonful contains 25 mg thioridazine base equivalent to 27.5 mg of thioridazine hydrochloride.

Concentrate for Syrup: A clear, orange liquid. Each 5 ml of Concentrate diluted to 150 ml with Syrup BP produces a Melleril syrup containing 25 mg of thioridazine base, equivalent to 27.5 mg of thioridazine hydrochloride, in 5 ml.

Tablets: White, coated tablets available in four strengths:

10 mg Thioridazine Tablets BP, 5.5 mm diameter, 3.5 mm thickness, weight 100 mg, branded MEL 10.

25 mg Thioridazine Tablets BP, 8.2–8.4 mm diameter 5.0–5.3 mm thickness, weight 260 mg, branded MELLERIL 25.

50 mg Thioridazine Tablets BP, 10.0–10.3 mm diameter, 5.5 mm thickness, weight 450 mg, branded MELLERIL 50.

100 mg Thioridazine Tablets BP, 11.1–11.5 mm diameter, 6.0–6.3 mm thickness, weight 600 mg, branded MELLERIL 100.

Uses *Principal action:* Melleril is a phenothiazine tranquilliser with specificity of psychotherapeutic action. The most striking aspect of Melleril therapy is the low incidence of side-effects throughout the full therapeutic range. Although the basic pharmacological actions of Melleril are similar to those of the phenothiazines generally, properties have been described which support the observation that the antipsychotic activity is more specific than that of other tranquillisers. Controlled clinical trials have established that Melleril is extremely effective and singularly free from the serious side-effects associated with the use of other phenothiazines—particularly extrapyramidal, allergic, hepatic and haemopoietic complications. Melleril is often well tolerated by patients experiencing untoward reactions with other tranquillisers.

† **Hospitals only.**

Indications: Melleril is indicated for the restoration of normal behaviour in a wide range of mental and emotional disturbances characterised by anxiety, tension and agitation. It is particularly effective in the management of acute and subacute schizophrenia and manic psychoses. Good results have been reported in the treatment of chronic psychoses, acute and chronic psychoneuroses, senile confusional states and behaviour disorders in children. Melleril controls the patient without excitation or undue drowsiness. It improves thought disorders and enables communication to be established. The patient is more alert, is more co-ordinated and is more able to co-operate in rehabilitation programmes.

Dosage and administration

	<i>Daily dose range in terms of hydrochloride</i>
Adults	
<i>Mental and emotional disturbance</i>	
Severe: acute schizophrenia, manic psychoses, etc.	150–600 mg
For acute schizophrenia, an initial loading dose of 200 mg may be given. In resistant patients, up to 800 mg daily may be administered for not more than four weeks.	
Moderate: psychomotor agitation in severe psychoneuroses, etc.	75–200 mg
Mild: anxiety, tension, apprehension, etc	30–100 mg
Children	
<i>Behaviour disorders</i>	
Under 5	1 mg (thioridazine hydrochloride) kg/body weight
Over 5	$\frac{1}{4}$ – $\frac{1}{2}$ adult dosage

Contra-indications, warnings, etc

Contra-indications: Severely depressed or comatose states.

Precautions: Cross-sensitivity to phenothiazines in general has been suggested whereby patients who have demonstrated a hypersensitivity reaction to one phenothiazine may be more prone to undergo a similar reaction to others. Phenothiazines are capable of potentiating central nervous system depressants (e.g. anaesthetics, analgesics, hypnotics, narcotics, antihistamines, alcohol, etc) as well as atropine and phosphorus insecticides. Melleril may potentiate the inhibitory effect of quinidine on cardiac contractility. Like other phenothiazines Melleril has an adrenolytic action and may therefore interfere with the pressor effects of adrenergic vasoconstrictors. Phenothiazines should be administered with caution to patients who participate in activities requiring complete mental alertness.

Regular blood counts are recommended during the first three to four months of treatment or if any clinical signs of blood dyscrasias appear.

In liver disease regular monitoring of liver function is necessary. During pregnancy and breast feeding, Melleril should only be administered under compelling circumstances.

Overdosage: Acute overdosage of Melleril usually gives rise to coma with shallow breathing, hypotension and absence of reflexes. Epileptiform convulsions, motor restlessness and hyperflexia may occur. Treatment should be directed to the elimination of the ingested material by emesis and gastric lavage. General supportive measures should be applied with particular reference to the cardiovascular and respiratory systems.

Side-effects: Melleril is extremely well tolerated, as world-wide clinical usage has underlined the low incidence of side-effects. Minor side-effects such as drowsiness, dizziness, faintness, disturbances of accommodation, urinary incontinence, dryness of the mouth and nasal stuffiness may occur initially with high dosage but are usually transient. The incidence of extrapyramidal side-effects is low: moreover patients disabled by Parkinsonism with other phenothiazines may have troublesome symptoms on therapeutically equivalent larger doses of Melleril. Tardive dyskinesias have been reported after prolonged treatment with high doses, but very infrequently. Amenorrhoea, galactorrhoea and impairment of male sexual function may occur, but respond to a reduction in dosage. Oedema and weight gain have occurred. Transient leucopenia and other blood dyscrasias have been reported, but agranulocytosis has not occurred in a few isolated cases. Altered seizure control is very rare during Melleril treatment, as are photoallergic and phototoxic reactions. ECG changes associated with the administration of phenothiazines have been reported but these are not regarded as evidence of cardiotoxicity. The changes reported include prolongation of the Q-T interval, a lowering and inversion of the T-wave, an appearance of a wave tentatively identified as a bifid or a U-wave. These changes are due to altered myocardial repolarisation and are not related to myocardial damage. They are more likely to occur in the presence of low potassium blood levels and are reversible. There is no clear evidence that they are precursors of the arrhythmias which occur very rarely. Pigmentary retinopathy with disturbance of visual function has been reported as a toxic reaction to excessive doses given long term in very small number of patients. Treatment with Melleril in doses in excess of 1,000 mg per day over long period is not recommended. There may be instances when it is considered necessary to exceed the recommended maximum daily dose of 600 mg, but clinical experience suggests that Melleril is unlikely to be suitable for the patient who does not respond to doses up to 800 mg per day.

Pharmaceutical precautions Melleril Concentrate should be diluted with preservative-free Syrup BP.

For the diabetic patient, Melleril Concentrate may be diluted with Sorbitol Solution BPC.

Melleril Suspension should not be diluted with any of the usual diluents, but the two strengths may be admixed to give a dosage range of between 25 mg and 100 mg per 5 ml spoonful. If an electric stirrer is used, care should be taken to avoid the incorporation of air. Melleril Concentrate, Syrup and Suspension should be protected from light.

Legal category POM.

Package quantities *Melleril Suspension:* 25 mg in 5 ml: Bottles of 1 litre.

100 mg in 5 ml: Bottles of 1 litre.

Melleril Syrup: Bottles of 100 ml, 500 ml, 1 litre and 2 litres.

Melleril Concentrate: Bottles of 500 ml.

Melleril Tablets: 10 mg: Containers of 100 tablets.

25 mg and 50 mg: Containers of 100, 1,000 and 5,000 tablets.

100 mg: Containers of 100 (2 × 50) 1,000 and 5,000 tablets.

Further information Both strengths of Melleril Suspension contain 3.16 g of sucrose per 5 ml spoonful and have an absolute calorific value of 14 kJ.

Melleril Syrup contains 2.25 g of sucrose per 5 ml of syrup and has an absolute calorific value of 1.36 kcal per dose.

PARAGESIC*

Presentation Paragesic are yellow, uncoated, round, 10 tablets with a rough surface, 25.4 mm diameter, 4.7–5.1 mm thick, weighing 3.5 g. Each effervescent tablet contains:

Paracetamol PhEur	500 mg
Pseudoephedrine Hydrochloride BP	20 mg
Caffeine PhEur	10 mg

Uses Paragesic is a decongestant analgesic preparation containing pseudoephedrine, paracetamol and caffeine. Rapid solution in water gives a pleasant drink which provides the active ingredients in a form immediately available for gastro-intestinal absorption.

Indications: Paragesic is indicated for the relief of conditions where upper respiratory congestion is associated with pain, as in coryza, naso-pharyngitis and influenza; also as an adjunct for the relief of symptoms associated with sinusitis or hay fever.

Dosage and administration One to two tablets dissolved in $\frac{1}{2}$ – $\frac{3}{4}$ a tumblerful of either warm or cold water very four hours. Not more than 8 tablets should be taken in a 24-hour period.

Contra-indications, warnings, etc As pseudoephedrine is a sympathomimetic amine, Paragesic should be administered with caution to hypertensive patients, patients suffering from heart failure or to patients with incipient or established urinary retention and should not be given to patients being treated with monoamine oxidase inhibitors or antihypertensives. Caution is necessary in patients receiving beta-blockers. Paragesic is not suitable for patients on a restricted sodium intake.

Overdosage: Only one case of overdosage has been reported to the Company. Large overdoses are unlikely with effervescent preparations but if more than ten tablets are taken, paracetamol levels should be checked and the antidotes, methionine or N-acetyl cysteine should be given if indicated by ingested dose, plasma level and time since ingestion to prevent liver damage.

Pharmaceutical precautions Store in a cool dry place.

Legal category P.

Package quantities Boxes of 100 effervescent tablets (5 tubes of 20).

Further information Paragesic Tablets each contain 17.7 mg sucrose and have an absolute calorific value of 1.76 kcal.

Dessicant capsule contains 1.2 g silica gel with 6 mg talc and is harmless.

Product licence number 0101/5037.

PARLODEL*

Presentation 2.5 mg Tablets: White, round, flat, bevel-edged tablets, 7 mm in diameter, scored and coded 'XC' on one side and marked 'SANDOZ' on the other side, weight 140 mg. Each tablet contains 2.87 mg bromocriptine mesylate equivalent to 2.5 mg bromocriptine base.

10 mg Capsules: Opaque, white, hard gelatin capsules, size 1 each containing 11.47 mg bromocriptine mesylate equivalent to 10 mg bromocriptine base.

Uses *Principal action:* Parlodel is a dopaminergic-receptor stimulant or dopamine agonist. This pharmacological action is manifest in normal individuals and those with hyperprolactinaemic states by an inhibition of the secretion of prolactin by the pituitary; in many acromegalic patients a lowering of elevated circulating growth hormone levels results.

In patients with prolactin secreting adenomas there is radiological evidence to indicate tumour regression in some cases. Improvement in visual field defects and in general anterior pituitary function may also occur.

Because of its dopaminergic activity Parlodel is also effective in idiopathic Parkinson's disease, which is characterised by a specific nigro-striatal dopamine deficiency.

Indications: The inhibition or suppression of puerperal lactation.

The treatment of hyperprolactinaemia in men and women with hypogonadism and/or galactorrhoea.

The treatment of hyperprolactinaemic infertility.

Parlodel has been used successfully in the treatment of a number of infertile women who do not have demonstrable hyperprolactinaemia.

In a number of specialised units, patients who have been shown to have prolactin secreting adenomas have been treated successfully with Parlodel.

In particular Parlodel can be considered as a first choice of treatment in patients with macroadenomas and as an alternative to the surgical procedure, transphenoidal hypophysectomy, in patients with microadenomas.

The treatment of cyclical benign breast disease/cyclical pronounced mastalgia.

Cyclical menstrual disorders have also responded to Parlodel, particularly breast symptomatology but, in the premenstrual syndrome, there is also some evidence that other symptoms, such as headache, mood changes and bloatedness, may be alleviated.

Parlodel has also been used in a number of specialised units, as an adjunct to surgery and/or radiotherapy, to reduce circulating growth hormone levels in the management of acromegalic patients.

In the treatment of idiopathic Parkinson's disease, Parlodel has been used both alone and in combination with levodopa in the management of previously untreated patients and those disabled by 'on-off' phenomena. Parlodel has been used with occasional benefit in patients who do not respond to or are unable to tolerate levodopa and those whose response to levodopa is declining.

Dosage and administration Parlodel should always be taken during a meal.

A number of disparate conditions are amenable to treatment with Parlodel and, for this reason, the recommended dosage regimens are variable. In most indications, irrespective of the final dosage, the optimum response with the minimum of side-effects is best

achieved by gradual introduction of Parlodel. The following scheme is suggested:

Initially, $\frac{1}{2}$ a tablet (1.25 mg) at bedtime, increasing after two to three days to 1 tablet (2.5 mg) at bedtime. Dosage may then be increased by $\frac{1}{2}$ to 1 tablet at two to 3 day intervals until a dosage of 2.5 mg twice daily is achieved. Further dosage increments, if necessary, should be added in a similar manner.

Prevention of lactation: 2.5 mg on the day of delivery followed by 2.5 mg twice daily for 14 days. Gradual introduction of Parlodel is not necessary in this indication.

Suppression of lactation: 2.5 mg on the first day, increasing after two to three days to 2.5 mg twice daily for 14 days. Gradual introduction of Parlodel is not necessary in this indication.

Hypogonadism/galactorrhoea syndromes/infertility: Introduce Parlodel gradually according to the suggested scheme. Most patients with hyperprolactinaemia have responded to 7.5 mg daily, in divided doses, but doses of up to 30 mg daily have been used. In infertile patients, without demonstrably elevated serum prolactin levels, the usual dosage is 2.5 mg twice daily.

Prolactinomas: Introduce Parlodel gradually according to the suggested scheme. Dosage may then be increased by 1 tablet daily at 2–3 day intervals as follows: 2.5 mg eight hourly, 2.5 mg six hourly, 5 mg six hourly. Patients have responded to doses of up to 30 mg using 2.5 mg tablets or 10 mg capsules as appropriate.

Cyclical benign breast disease/cyclical pronounced mastalgia/cyclical menstrual disorders.

Introduce Parlodel gradually, according to the suggested scheme, until the recommended dosage of 2.5 mg twice daily is reached.

Acromegaly: Introduce Parlodel gradually, according to the suggested scheme. Dosage may then be increased by 1 tablet daily at two to three-day intervals as follows: 2.5 mg eight hourly, 2.5 mg six hourly, 5 mg six hourly.

Patients have responded to doses of between 20 mg and 60 mg daily using 2.5 mg tablets or 10 mg capsules as appropriate.

Parkinson's Disease: Introduce Parlodel gradually as follows: Week 1, 1.25 mg at bedtime, Week 2, 2.5 mg at bedtime, Week 3, 2.5 mg twice daily. Thereafter, take 3 times a day increasing by 2.5 mg every 3 to 14 days depending on the patient's response. Continue until the optimum dose is reached. This will usually be between 10 and 80 mg daily. In patients already receiving levodopa the dosage of this drug may be gradually decreased whilst the dosage of Parlodel is increased until the optimum balance is determined.

Contra-indications, warnings, etc *Contra-indications:* No absolute contra-indications to treatment with Parlodel are known. For procedure during pregnancy see Precautions and Further Information.

Precautions: Hyperprolactinaemia may be idiopathic, drug-induced, or due to hypothalamic or pituitary disease. The possibility that hyperprolactinaemic patients may have a pituitary tumour should be recognised and complete investigation at specialised units to identify such patients is advisable. Parlodel will effectively lower prolactin levels in patients with pituitary tumours but does not obviate the necessity for radiotherapy or surgical intervention where appropriate in acromegaly. Rare reports have been made of rapid expansion of pre-existing pituitary tumours during pregnancy and this may also occur in patients who have been able to conceive

as a result of Parlodel therapy. As a precautionary measure, in cases of established pregnancy, visual field should be monitored to detect untoward effects; pituitary enlargement so that Parlodel may be reintroduced or other appropriate treatment instituted.

If pregnancy occurs it is advisable to withdraw Parlodel after the first missed menstrual period for most patients. However, with increasing evidence of lack of teratogenic and embryopathic effect in the human subject, consideration should be given to maintaining treatment in those cases where there is evidence of a large tumour or expansion.

Treatment of women suffering from hyperprolactinaemic amenorrhoea with Parlodel results in ovulation. Patients in whom pregnancy is undesirable, or unwanted should be advised to take contraceptive measures other than an oral contraceptive. When women of child-bearing age are treated with Parlodel for conditions not associated with hyperprolactinaemia the lowest effective dose should be used. This is in order to avoid suppression of prolactin to below normal levels, with consequent impairment of luteal function.

Gynaecological assessment, preferably including cervical and endometrial cytology, is recommended for women receiving Parlodel for extensive periods. Six monthly assessment is suggested for post-menopausal women and annual assessment for women with regular menstruation.

Hypotensive reactions may be disturbing in some patients during the first few days of treatment; an particular care should be exercised when driving vehicle or operating machinery. Tolerance to Parlodel may be reduced by alcohol.

Parlodel has been administered to patients concurrently with phenothiazines, effectively lowering raised prolactin levels but without apparently interfering with the psychotropic effects of these drugs. Adverse reactions between psychotropic agents and Parlodel have not been reported to the company.

In acromegalic patients, whilst Parlodel may effectively lower growth hormone levels, treatment to limit expansion of the tumour is also indicated. An acromegalic patient should be carefully assessed for peptic ulceration prior to treatment with Parlodel and advised to report gastrointestinal side-effects promptly, as gastro-intestinal bleeding has been reported, though the connection with treatment is not proven.

Caution is required where Parlodel is being given in high doses to patients with a history of psychotic disorders or severe cardiovascular disease.

Among Parkinsonian patients on long-term, high-dose Parlodel treatment, pleural effusions have been observed in some cases. While a causal relationship between Parlodel and these findings is uncertain, patients presenting with unexplained pleuro-pulmonary signs or symptoms should be examined thoroughly and discontinuation of Parlodel therapy should be contemplated.

Overdosage: Overdosage with Parlodel is likely to result in vomiting and other symptoms which could be due to over-stimulation of the dopaminergic receptors, and might include confusion, hallucinations and hypotension. General supportive measures should be undertaken to remove any unabsorbed material and maintain the blood pressure if necessary.

Side-effects: Nausea is the most commonly occurring side-effect. Postural hypotension, dizziness, headache, vomiting, and mild constipation have also occasionally been reported. The occurrence of side-effects is mini-

ised by taking Parlodel during a meal and by gradual introduction of the dose. If side-effects do occur a reduction of dosage, followed in a few days by a more gradual increase, will ameliorate the symptoms.

In acromegalic and Parkinsonian patients receiving high doses of Parlodel, digital vasospasm induced by cold has occasionally occurred. Drowsiness and, less frequently, confusion, psychomotor excitation, hallucinations, dyskinesia, dry mouth and leg cramps have been reported during high-dose treatment of Parkinson's disease with Parlodel. All these side-effects are dose-dependent and can usually be controlled by a reduction of dosage and a more gradual implementation of dosage increments.

Pharmaceutical precautions

Tablets: Protect from heat and damp.

Capsules: Protect from heat and damp.

Legal category POM.

Package quantities 2.5 mg Tablets: Containers of 30 and 500.

0 mg Capsules: Containers of 100.

Further information Based on the outcome of over 400 completed pregnancies in mothers who were given Parlodel at some stage in the early weeks of pregnancy, it may be concluded that the use of Parlodel to restore fertility is not associated with an increased risk of abortion, premature delivery, multiple pregnancy or occurrence of malformation in infants.

2.5 mg Tablets 0101/0061

0 mg Capsules 0101/0108

'PHOSPHATE-SANDOZ'

Presentation Flat, round, white, effervescent tablets with a rough surface, weight 3.7 g, 25.4 mm diameter and 4.5 mm thick. Citrus flavoured. Each effervescent tablet contains 1.936 g anhydrous sodium acid phosphate, 350 mg Sodium Bicarbonate PhEur and 315 mg Potassium Bicarbonate BPC. This provides the equivalent of 500 mg elemental phosphorus, 468.8 mg sodium (20.4 mmol: 20.4 mEqNa⁺), 123 mg potassium (3.1 mmol: 3.1 mEq K⁺), also 800 mg anhydrous citric acid (787.4 mg citrate ion).

Uses *Principal action:* High-dose phosphate supplement.

Oral administration of inorganic phosphates produces a fall in serum calcium in patients with hypercalcaemia. Phosphate-Sandoz Effervescent Tablets also contain sodium ions which aid the correction of the dehydration and sodium depletion seen in hypercalcaemia.

Indications: Hypercalcaemia associated with such conditions as hyperparathyroidism, multiple myelomatosis and metastatic bone disease.

Dosage and administration Phosphate-Sandoz Effervescent Tablets should be dissolved in $\frac{1}{3}$ – $\frac{1}{2}$ a tumblerful of water.

Dosage should be adjusted to suit the requirements of individual patients. Excessive dosage has been reported to produce hypocalcaemia in isolated cases.

Adults: Hypercalcaemia: Up to 6 tablets daily (adjustment being made accordingly to requirements).

Vitamin D resistant rickets: 4–6 tablets daily.

Children under five years: half the adult dose should be given.

Contra-indications, warnings, etc *Precautions:* Consideration should be given to the sodium and potassium content of Phosphate-Sandoz Effervescent Tablets before administration to patients suffering from conditions associated with significant electrolyte imbalance, impaired renal function or where limitation in sodium intake is indicated, e.g. in the treatment of congestive cardiac failure, hypertension, pre-eclampsic toxemia, etc.

Soft-tissue calcification and nephrocalcinosis have been reported in isolated cases following intravenous therapy with phosphate. This is thought to be a function of dosage and rapidity of phosphate administration. While such effects appear less likely to occur following treatment with oral phosphates, careful surveillance of patients is recommended, especially if on long-term therapy.

Side-effects: Apart from diarrhoea, very few side-effects have been reported.

Overdosage: Excessive dosage has been reported to produce hypocalcaemia in isolated cases. This has proved reversible when dosage has been adjusted. However, deliberate overdosage is unlikely with effervescent preparations.

Pharmaceutical precautions Phosphate-Sandoz Tablets must be stored in a cool dry place, and since they are hygroscopic they should be dispensed in their original containers.

Legal category P.

Package quantities Boxes of 100 (5 tubes of 20 effervescent tablets).

Further information Phosphate-Sandoz Tablets each contain 136 mg sucrose and have an absolute calorific value of 2.5 kcal.

Product licence number 0101/5038.

SANCOS®

Presentation A clear, colourless liquid with a citrus flavour. Each 5 ml spoonful contains 5 mg Pholcodine PhEur, 750 mg Glycerol PhEur and 5.25 g Syrup BP.

Uses *Principal action:* Cough sedative.

Pholcodine has a specific depressant effect on the cough centre in the medulla. The central antitussive action of pholcodine is at least three times as powerful as that of codeine. Pholcodine is many times less toxic than codeine and is employed in much smaller doses. It causes less respiratory depression than morphine and is not implicated in gastro-intestinal side-effects such as constipation, anorexia, vomiting, etc.

Indications: Unproductive cough.

Dosage and administration **Adults:** Two 5 ml spoonfuls every three to four hours as required.

Children: Half to one 5 ml spoonful according to age and weight, every three to four hours as required.

Contra-indications, warnings, etc

Contra-indications and precautions: There are no known contra-indications to Sancos apart from use in patients where suppression of cough reflex is inadvisable.

Side-effects: Side-effects from Sancos are rare, however pholcodine may occasionally cause nausea and drowsiness.

Overdosage: Treatment should be directed to the elimination of the ingested material by gastric lavage. General supportive measures are of importance.

Pholcodine may cause respiratory depression and there may be pin-point pupils. This can be reversed by naloxone given 0.4 to 1.2 mg i.v. for adults and 0.01–0.1 mg/kg body weight for children. The dose may be repeated if initial response is not maintained.

Pharmaceutical precautions Sancos may be diluted with Syrup BP. The diluted syrup should be used within 14 days.

Legal category P.

Package quantities Bottles of 100 ml and 2 litres.

Further information Sucrose content of 3.5 g per 5 ml. Absolute calorific value 15 kJ per 5 ml.

Product licence number 0101/5041.

SANCOS* CO

Presentation Clear, colourless syrup with a citrus flavour. Each 5 ml spoonful contains 5 mg Pholcodine PhEur, 20 mg Pseudoephedrine Hydrochloride BP, 2 mg Chlorpheniramine Maleate BP, 600 mg Glycerol PhEur and 5.25 g Syrup BP.

Uses *Principal action:* Sancos Compound Linctus is a cough suppressant and decongestant. Of the active ingredients, pholcodine has a specific depressant effect on the cough centre in the medulla, has a more potent action than codeine and causes less respiratory depression than morphine. It is not implicated in gastrointestinal side-effects such as constipation, anorexia or vomiting and it also has the advantage of being well tolerated by children. Pseudoephedrine hydrochloride is an effective nasal and bronchial decongestant. Chlorpheniramine maleate is a well-tried antihistamine beneficial in the management of nasal irritation and in associated allergic symptoms.

Indications: The relief of cough, particularly when associated with congestion of nasal and bronchial mucous membranes.

Dosage and administration *Adults:* two to three 5 ml spoonfuls every six hours as required.

Children: 6 to 12 years: one to two 5 ml spoonfuls every six hours as required.

2 to 6 years: half to one 5 ml spoonful every six hours as required.

Do not exceed 3 doses (adults or children) in 24 hours.

Contra-indications, warnings, etc *Precautions.* As pseudoephedrine is a sympathomimetic amine, Sancos Compound Linctus should be given with caution to hypertensive patients, patients suffering from heart failure or to patients with incipient or established urinary retention, and should not be given to those being treated with monoamine oxidase inhibitors or antihypertensives. Caution is necessary in patients receiving beta-blockers.

Antihistamines may cause drowsiness and dulling of mental alertness. Patients undergoing treatment with Sancos Compound Linctus are advised not to take charge of vehicles, or other means of transport or machinery where loss of attention may lead to accidents.

Care should be exercised when administering an antihistamine to patients with epilepsy as convulsions may be precipitated, especially in children.

Side-effects: The side-effects are those attributed to antihistamines generally and the commonest include drowsiness, nausea, vomiting, headache, blurred vision, anorexia and dryness of the mouth.

Overdosage: Treatment should be directed to the elimination of the ingested material by gastric lavage. General supportive measures are of importance.

Pholcodine may cause respiratory depression and there may be pin-point pupils. This can be reversed by naloxone given 0.4 to 1.2 mg i.v. for adults and 0.01–0.1 mg/kg body weight for children. The dose may be repeated if the initial response is not maintained.

Pharmaceutical precautions Sancos Compound Linctus may be diluted with Syrup BP. The diluted syrup should be used within 14 days.

Legal category P.

Package quantities Bottles of 100 ml and 2 litres.

Further information Sucrose content 3.5 g per 5 ml dose. Absolute calorific value 15 kJ per 5 ml.

Product licence number 0101/5042.

SANDOCAL* CALCIUM-SANDOZ*

Presentation *Sandocal:* Orange, slightly speckled, flat-faced, round, effervescent tablets with a rough surface, weighing 6.3 g, 33 mm diameter and 5.6 mm thick. Orange-flavoured. Each effervescent tablet contains 3.08 g calcium lactate gluconate, equivalent to 4.5 g calcium gluconate and provides 400 mg calcium (10 mmol: 20 mEq Ca⁺⁺), 137 mg sodium (6 mmol: 6 mEq Na⁺), 176 mg potassium (4.5 mmol: 4.5 mEq K⁺) and 1.1 g anhydrous citric acid (1.08 g citrate ion).

Calcium-Sandoz Syrup: Colourless to pale straw coloured, fruit-flavoured syrup. Each 15 ml contains 3.27 g calcium gluconate and 2.17 g calcium galactogluconate. Three 5 ml spoonfuls provide 3.25 mg calcium (8.1 mmol: 16.2 mEq Ca⁺⁺).

Calcium-Sandoz Ampoules 10%: Clear, colourless solution. Each 10 ml contains 1.375 g calcium gluconate, equivalent to 10% calcium gluconate (93 mg calcium–2.32 mmol: 4.64 mEq Ca⁺⁺).

Uses *Principal action:* Calcium in convenient dosage forms to correct deficiency states.

Indications: High-dose oral calcium in the form of Sandocal Effervescent Tablets and Calcium-Sandoz Syrup is indicated in the treatment of pregnancy cramp and neonatal tetany, and as a therapeutic supplement in osteoporosis, post-gastrectomy malabsorption, osteomalacia, rickets, pregnancy, lactation.

Parenteral administration is indicated when the pharmacological action of a high calcium ion concentration is required.

Dosage and administration *Oral:* See table.

Parenteral: 5–10 ml of Calcium-Sandoz 10% i.v. or i.m. daily or every other day.

Children require about half the adult dosage.

Intramuscular injections should be given deep in the gluteus medius muscle using a long needle; this route is not recommended for children.

<i>Indication</i>	<i>Daily dosage Effervescent Tablets (The tablets must be dissolved in $\frac{3}{4}$–$\frac{1}{2}$ tumblerful of water)</i>	<i>Syrup (ml)</i>
osteoporosis		
post-gastrectomy		
malabsorption	3–5 tablets	60–100
osteomalacia and rickets		
osteostation		
pregnancy supplement	1–3 tablets	20–60
pregnancy cramps		
neonatal tetany		5 ml four-hourly, mixed with milk feed

Intravenous injections should be given very slowly (three minutes for 10 ml).

Calcium-Sandoz should not be injected subcutaneously.

Contra-indications, warnings, etc

Contra-indications: Severe hypercalcaemia and hypercalciuria (e.g. in hyperparathyroidism, vitamin D over-dosage, decalcifying tumours such as plasmacytoma and skeletal metastases, in severe renal failure and in osteoporosis due to immobilisation). Parenteral calcium therapy is strictly contra-indicated in patients receiving cardiac glycosides.

Precautions: Consideration should be given to the sodium and potassium content of Sandocal Effervescent tablets (see under 'Presentation') before administration to patients suffering from conditions associated with significant electrolyte imbalance, impaired renal function or where limitation in sodium intake is indicated e.g. in the treatment of congestive cardiac failure, hypertension, re-eclamptic toxemia, etc. In these cases Calcium-Sandoz Syrup, which contains neither sodium nor potassium, may be substituted for the tablet. Careful monitoring of blood levels and urinary calcium excretion is especially necessary when high-dose parenteral calcium therapy is administered, particularly in children. Treatment should be suspended immediately if blood calcium exceeds 105–110 mg/litre or if the 24-hour urinary calcium excretion exceeds 5 mg/kg when it is also necessary to be alert to the possibility of cardiac dysrhythmias.

Overdosage: No cases of intoxication with calcium due to deliberate or accidental overdosage have been reported to the Company. Deliberate overdose is unlikely with effervescent preparations.

Side-effects: Diarrhoea has occurred in a very small number of patients receiving Sandocal. If intravenous injection is administered too rapidly, nausea, vomiting, hot flushes, sweating, hypotension and even vaso motor collapse may ensue.

Pharmaceutical precautions Sandocal Tablets must be stored in a cool dry place.

Calcium-Sandoz Syrup may be diluted with Syrup BP; the diluted syrup should be used within 14 days.

Legal category Sandocal P.
Calcium-Sandoz Syrup P.
Calcium-Sandoz Injection POM.

Package quantities Sandocal Effervescent Tablets: boxes of 100 (5 tubes of 20).

Calcium-Sandoz Syrup: Bottles of 500 ml.
Calcium-Sandoz Ampoules: Boxes 5 × 10 ml.

Further information Sandocal Tablets contain 935.5 mg sucrose per tablet and have an absolute calorific value of 18.33 kcals.

Calcium-Sandoz Syrup contains 4.536 g sucrose per 15 ml dose. Absolute calorific value 54 kcals per 15 ml dose.

Product licence numbers

Effervescent Tablets 0101/5043
Syrup 0101/5024
Ampoules 0101/5003

SANDO-K*

Presentation Flat, round, white, effervescent tablets with a slightly rough surface, weighing 2.4 g and of 22 mm diameter and 4.25 mm thickness. Salty taste. Each tablet contains 600 mg Potassium Chloride PhEur, 400 mg Potassium Bicarbonate BPC and 800 mg of anhydrous citric acid. This provides the equivalent of 470 mg potassium (12 mmol: 12 mEq K⁺) and 285 mg chloride (8 mmol: 8 mEq Cl⁻); also 2.1 mg sodium content.

Uses *Principal action:* Sando-K Effervescent Tablets provide a high-dose, palatable potassium supplement in solution.

Enteric-coated and matrix-type solid-dose forms of potassium have been incriminated in the development of small-bowel ulceration, obstruction, perforation, stenosis and haemorrhage, probably produced by high local potassium concentration. Sando-K Effervescent Tablets when dissolved in water prevent such local concentration, thus minimising gastro-intestinal irritation. Sando-K Effervescent Tablets contain 8 mmol of chloride ion, now believed to be of significance in limiting hypokalaemic, hypochloralaemic alkalosis.

Indications: Prevention and treatment of hypokalaemic states such as those associated with: administration of diuretics of the sulphamoyl group (includes thiazides, etc.); ulcerative colitis; renal tubular acidosis; Cushing's syndrome.

Dosage and administration Sando-K Effervescent Tablets must be dissolved in $\frac{3}{4}$ – $\frac{1}{2}$ a tumblerful of water and may be taken with food if preferred.

Dosage will depend upon the clinical conditions and diet of the patient and will vary widely, but 2–4 tablets daily (24 to 48 mmol K⁺) are likely to provide an adequate prophylactic or therapeutic dose in most patients. Large doses may be indicated in more severe hypokalaemic conditions when the dose should be regulated by the patient's response as determined by serum electrolyte levels.

Contra-indications, warnings, etc

Contra-indications and precautions: Care should be taken to avoid dosage in excess of requirements for patients with impaired renal function.

Side-effects: Side-effects are rare with Sando-K. If there are any signs of gastric irritancy, Sando-K, in common with all other potassium salts, should be given with or after food.

Overdosage: Hyperkalaemia. Deliberate overdosage is unlikely with effervescent preparations. Poisoning is usually minimal below 6.5 mmol: mEq/L. moderate between 6.5 and 8 mmol: mEq/L and severe above that

level. The absolute toxicity is governed by both pH and associated sodium levels. Hyperkalaemic symptoms, and particularly the ECG effects, may be transiently controlled by calcium gluconate, administration of glucose or glucose and insulin, sodium bicarbonate or hypertonic sodium infusions, cation exchange resins or by haemodialysis and peritoneal dialysis. Caution should be exercised in patients who are digitalised and who may experience acute digitalis intoxication in the course of potassium removal.

Pharmaceutical precautions Store in a cool dry place. Sando-K Effervescent Tablets are hygroscopic and wherever possible should be dispensed in their original containers which carry a note to the patient requesting that the containers be kept tightly closed in a cool dry place.

Legal category P.

Package quantities Boxes of 100 (5 × 20 effervescent tablets).

Further information Sando-K Tablets each contain 557.5 mg sucrose and have an absolute calorific value of 4.5 kJ.

Product licence number 0101/5044.

SYNTOCINON* NASAL SPRAY

Presentation Syntocinon Spray is available as a solution containing 40 units of synthetic oxytocin in 1 ml for intranasal administration.

Uses *Principal action:* Syntocinon is synthetic oxytocin, identical to the polypeptide hormone released by the posterior lobe of the pituitary gland. It has been demonstrated that oxytocin has a physiological function in the neurohumoral reflex which makes milk available to the suckling infant.

The bulk of the milk secreted is held in the alveoli and small ductules of the breast by capillary attraction. The negative pressure induced by suckling only suffices to withdraw the small amount of milk in the larger ducts and cisterns. When a mother takes a baby to the breast, the stimulation of the nipple by suckling causes a nervous impulse to pass by an unknown afferent pathway to the hypothalamus and thence by the hypothalamo-hypophyseal tract to the posterior lobe of the pituitary which releases oxytocin into the bloodstream.

The hormone is carried by the blood, the efferent pathway, to the breast where it causes contraction of the myoepithelial cells surrounding the alveoli and small ductules forcing their milk content into the larger ducts converging on the nipple. This reflex which makes milk available to the baby is known as the milk let-down or milk ejection reflex. This reflex may be inhibited in conditions of stress and it is possible to counteract the inhibitory processes by administering oxytocin. By allowing a free flow of milk, breast feeding is facilitated, resulting in an easier, more rapid and more complete emptying of the breast. The possibility of damage to the nipple is reduced as is milk engorgement and breast abscess formation. There is evidence to suggest that when the milk let-down reflex is established by the routine administration of oxytocin there is an increase in milk production.

The role of oxytocin in establishing the milk let down reflex has not been fully exploited in clinical medicine, since parenteral injection was considered necessary for

satisfactory absorption. Development work has been directed to the formulation of a spray solution and to the production of a container which enables a reasonably accurate dose of Syntocinon to be administered intranasally in the form of a fine spray. In this form, oxytocin has been shown to be sufficiently well absorbed from the nasal mucosa to elicit the milk let-down response.

Indications: To facilitate the establishment of breast feeding by eliciting the milk let-down reflex and allowing a free flow of milk. Thereby a) permitting a satisfactory feed; b) reducing damage to the nipples; c) preventing or relieving milk engorgement of the breasts; d) preventing breast abscess formation.

Dosage and administration The patient should be advised to hold the spray upright, insert the nozzle in the nostril and give the container one firm squeeze (approx. 2 oxytocic units) into one or both nostrils as directed by the doctor.

The spray should be used two to five minutes before the baby is put to the breast.

Contra-indications, warnings, etc

Contra-indications: Pregnancy; hypersensitivity.

Overdosage: It is considered that intoxication resulting from judicious usage is unlikely to occur with oxytocin administered by this route as it is rapidly inactivated by proteolytic enzymes in the alimentary tract.

Pharmaceutical precautions Store at temperature below 5°C, but do NOT freeze. Use within one month of opening.

Legal category POM.

Package quantities Spray bottles of 5 ml.

Further information Nil.

Product licence number 0101/5011.

SYNTOCINON* PARENTERAL SOLUTION

Presentation Syntocinon is available as Oxytocin Injection BP containing 2 units in 2 ml, 5 units in 5 ml or 10 units in 10 ml or 50 units in 50 ml.

Uses *Principal action:* Syntocinon is synthetic oxytocin which is identical with the polypeptide hormone released by the posterior lobe of the pituitary gland. Unlike oxytocin from natural sources, Syntocinon is completely free from vasopressin and extraneous animal protein.

At normal therapeutic doses, Syntocinon selectively stimulates the contraction of uterine smooth muscle.

Indications: Syntocinon Parenteral Solution may be used for: Induction of labour. Stimulation of labour in hypotonic uterine inertia. Management of missed and incomplete abortion. Postpartum haemorrhage in the occasional patient who does not respond to ergometrine.

Dosage and administration By intravenous drip infusion: 1 IU of oxytocin in 1 litre 5% dextrose solution delivers approximately 1 mU/min when infused at a rate of 15 drops per minute.

For induction or stimulation of labour:

1. Physiological oxytocin infusion. The range of dosage is between 2 mU and 5 mU/min.

2. Pharmacological oxytocin infusion. Initially 1½–2 mU/min adjusted gradually until contractions occur every two to five minutes, rate of infusion not exceeding 12 mU/min.

3. Oxytocin titration: Initially 1 mU/min, then double the rate of flow every 10 minutes until contractions commence. Thereafter double the rate of flow every 20 minutes until contractions lasting 40–50 seconds occur at intervals of two to three minutes. Doses of oxytocin up to 128 mU/min have been used.

Issued abortion: 10–20 units per 500 ml of 5% dextrose solution increasing by 10–20 units per 500 ml every hour to a maximum of 100 units per 500 ml if necessary. The rate of infusion recommended is 10–30 drops per minute.

Contra-indications, warnings, etc

Contra-indications: The use of Syntocinon is contraindicated in hypertonic uterine inertia, mechanical obstruction to delivery, failed trial labour, severe toxæmia, predisposition to amniotic fluid embolism, foetal distress and placenta prævia.

Precautions: Considerable caution should be exercised in abnormal presentation, multiple pregnancy, excessive irritability and previous caesarian section. High doses of oxytocin should only be used in fully equipped centres where patients can be kept under constant observation. In patients with cardiovascular disorders the infusion volume should be low.

Overdosage: The fatal dose of Syntocinon has not been established. Syntocinon is subject to inactivation by proteolytic enzymes of the alimentary tract. Hence it is not absorbed from the intestine and is not likely to have toxic effects when ingested.

Where high doses of Syntocinon are given with large volumes of electrolyte-free fluid, the following symptoms of water intoxication may occur:

1. Headache, anorexia, nausea, vomiting and abdominal pain.
2. Lethargy, drowsiness, unconsciousness and grand mal type seizures.
3. The electrolyte concentration in blood is low.

Treatment: All fluid intake should be restricted. Diuresis should be promoted as soon as possible and the electrolyte imbalance should be corrected. Convulsions may be controlled by judicious use of diazepam. In the case of coma, a free airway should be maintained with the routine measures normally employed in the nursing of the unconscious patient.

Side-effects: As there is a wide variation in uterine sensitivity, uterine spasm may be caused in some instances by what are normally considered to be low doses.

Very high doses may cause violent uterine contractions leading to uterine rupture, tissue damage and asphyxia of the foetus.

Pharmaceutical precautions Protect from light. Store between 4° and 22°C.

Syntocinon should not be infused via the same apparatus as blood or plasma, because the peptide packages are rapidly inactivated by oxytocinase. Syntocinon is incompatible with solutions containing sodium metabisulphite as a stabiliser.

Syntocinon is compatible with the following commonly used infusion fluids, but due attention should be paid to the advisability of using electrolyte fluids in individual patients. Dextrose 5%. Sodium/potassium chloride 103 mmol Na⁺ and 51 mmol K⁺. Laevulose 20%. Macrodex 6%. Sodium bicarbonate 1.39%. Sodium chloride 0.9%. Sodium lactate 1.72%. Rheomacrodex 0%. Ringer's solution.

Legal category POM.

Package quantities 50IU/5 ml: Boxes of 5.

10IU/1 ml: Boxes of 10.

5IU/1 ml: Boxes of 10.

2IU/2 ml: Boxes of 10.

2 IU 0101/0068

SYNTOMETRINE*

Presentation Syntometrine is available as a parenteral solution containing Ergometrine Maleate PhEur 500 mcg and 5 units of oxytocin in 1 ml.

Uses *Principal action:* Designed for intramuscular injection. Syntometrine combines the known sustained oxytocic action of ergometrine with the more rapid action of oxytocin on the uterus. The latent period following an intramuscular injection of Syntometrine is considerably shorter than with any other ergot preparation.

Indications: Syntometrine is indicated in the active management of the third stage of labour or, routinely following the birth of the placenta, to prevent or treat postpartum haemorrhage.

Dosage and administration Intramuscular injection of 1 ml. May also be administered by intravenous injection in a dose of $\frac{1}{2}$ –1 ml.

Contra-indications, warnings, etc

Contra-indications: Severe disorders of liver or kidney function.

Precautions: When the intravenous route is employed, care should be exercised in patients of doubtful cardiac status.

Caution should be exercised in the presence of hypertension, sepsis, obliterative vascular disorders and liver or kidney failure.

Side-effects: Occasional reports of nausea, vomiting and abdominal pain.

Overdosage: No case of maternal intoxication with Syntometrine has been reported to the Company. Inadvertent administration to the newborn infant has proved fatal. In reported accidental neonatal overdosage cases, respiratory and cardiovascular support have been required.

Pharmaceutical precautions Protect from light. Store between 4° and 22°C.

Legal category POM.

Package quantities Boxes of 10 × 1 ml.

Further information Snap ampoules: no file required.

Product licence number 0101/5046.

SYNTOPRESSIN* NASAL SPRAY

Presentation Syntopressin is available as a solution containing lypressin 50 units per ml for use as a nasal spray.

Uses *Principal action:* Syntopressin is synthetic 8-lysine-vasopressin (lypressin). It is completely free of

oxytocin and extraneous animal protein. Syntopressin has a direct antidiuretic action. It is used for the control of polyuria in diabetes insipidus.

Indications: Diabetes insipidus, spontaneous or induced.

Dosage and administration One or two applications of the spray (2.5–5.0 i.u.) to one or both nostrils, repeated three to seven times a day according to the response of the patient.

The patient should be advised to hold the bottle upright and to spray the inside of one or both nostrils by squeezing the bottle firmly then removing from the nostril to release the pressure, one or more times at intervals as required to produce the desired dose.

Contra-indications, warnings, etc Coronary heart disease, anaesthesia with halothane or cyclopropane.

Precautions: As with other forms of vasopressin, caution is advised in the administration of this drug to patients suffering from advanced arteriosclerosis, peripheral vascular disease, hypertension, epilepsy and during pregnancy, particularly toxæmic.

Overdosage: No reports of overdosage have been reported to the Company.

Side-effects: Nausea, abdominal pain or urge to defæcate may follow injudicious use. On rare occasions nasal congestion with ulceration of the nasal mucosa has been reported.

Pharmaceutical precautions Store in a cool place, but do NOT freeze.

Legal category POM.

Package quantities Spray bottles of 5 ml.

Further information Nil.

Product licence number 0101/5047.

TORECAN®

Presentation *Tablets:* White, bi-convex, sugar-coated tablets of 7 mm diameter, weighing 180 mg and printed 'SANDOZ' on one face. Each tablet contains thiethylperazine maleate equivalent to 6.33 mg base (10 mg salt).

Ampoules: Clear, colourless-to-yellow-tinge parenteral solution. Each 1 ml ampoule contains thiethylperazine maleate equivalent to 6.5 mg base (10.86 mg salt).

Suppositories: White to pale-yellow suppositories weighing 1.93 g. Each suppository contains thiethylperazine maleate equivalent to 6.5 mg base (10.28 mg salt).

Uses *Principal actions:* Torecan is an anti-emetic and antinauseant. It controls vomiting, nausea and vertigo.

Torecan is a phenothiazine derivative which, unlike many other compounds in this group, exhibits specific anti-emetic and antivertiginous properties with little or no tranquillising, sedative or other effects.

The present concept of the vomiting mechanism is that emesis may be induced by direct action on the vomiting centre in the medulla or by lowering its threshold to stimulation. Excitation of the vomiting centre may result from direct visceral impulses or be secondary to stimulation of the chemoreceptor trigger zone. Pharmacological studies have shown that Torecan in similar doses will control vomiting induced by stimulation of both the chemoreceptor trigger zone and

the vomiting centre. This suggests that Torecan may possess a more effective action than other anti-emetic agents.

Indications: Torecan is indicated for the relief of vertigo and the control of nausea and vomiting associated with various causes, notably:

1. Labyrinthine disturbances – Ménière's disease, labyrinthitis, surgery, motion sickness, cerebral irritability and damage or disease of the inner ear.
2. Miscellaneous conditions – uraemia, drug idiosyncrasy, hepatic disorders, biliary diseases, migraine, alcoholism and malignant disease.
3. Gastro-intestinal disturbances – gastroenteritis.
4. Radiotherapy and treatment with cytostatic agents.
5. Post-operative nausea, vomiting and vertigo.

Dosage and administration *Tablets: Adults:* 1 tablet two or three times daily.

Children: Not recommended for children under 15 years.

Ampoules: Adults: 1 ml by intramuscular injection. Effective in 30–60 minutes.

Children: Not recommended for children under 15 years.

Suppositories: Adults: 1 suppository night and morning.

Children: Not recommended for children under 15 years.

Contra-indications, warnings, etc

Contra-indications: Severely depressed or comatose states. Hypersensitivity to phenothiazines.

Precautions: No cases of bone-marrow depression or renal toxicity have been reported. As with many synthetic drugs, the physician should nevertheless be alert to the possibility in susceptible individuals. On a very few occasions, jaundice has occurred following administration of Torecan, but a drug-effect relationship has not been established. Like most phenothiazines, Torecan may occasionally provoke extrapyramidal side-effects: females under 30 and particularly children appear more susceptible. Consequently, Torecan is not recommended for children under 15 years. These symptoms respond to withdrawal of the drug, or to treatment with sedative and anti-parkinsonian agents.

Torecan may impair reaction time and can potentiate the effects of sedatives and alcohol. Torecan should be given in pregnancy and during breast feeding only if strictly indicated.

Side-effects: Drowsiness, dryness of the mouth and occasional postural hypotension may occur, particularly if the maximum recommended dosage of 30 mg daily is exceeded.

Extra-pyramidal side effects – see 'Precautions'.

Overdosage: The symptoms of Torecan overdosage are similar to those of other phenothiazines with the exception that there is less CNS depression with Torecan. There is no specific antidote for acute phenothiazine poisoning therefore treatment is directed at minimising the amount of the drug absorbed, eliminating the absorbed drug from the body and combating the toxic effects of the overdose by gastric lavage, maintenance of adequate pulmonary ventilation and general supportive measures. Emetics are obviously of less value. If emetics are given and do not work, then do not exceed the normal dose. Peritoneal dialysis and haemodialysis are ineffective in treatment of phenothiazine poisoning. Symptoms of hypotension should be corrected.

Severe extrapyramidal reactions usually respond to

intravenous administration of anti-parkinsonian agents, e.g. Benztropine 2 mg i.v. or i.m.

Prophylactic antibiotic therapy is generally favoured. Hypothermia; body temperature should be allowed to recover naturally unless it falls below 30°C.

Pharmaceutical precautions Suppositories should be stored in a cool place.

Ampoules should be protected from light.

Legal category POM.

Package quantities *Tablets:* Containers of 50.

Ampoules: Boxes of 5 × 1 ml.

Suppositories: Boxes of 6.

Further information Nil.

Product licence numbers

Tablets 0101/5048

Ampoules 0101/5012

Suppositories 0101/5013

/ISKALDIX*

Presentation White, uncoated, round, flat, bevelled tablets of 7 mm diameter and weighing 120 mg. Coded 7D with a single breakline on one side. Each tablet contains 10 mg pindolol and 5 mg clopamide.

Uses *Principal action:* Viskaldix is a combination of the beta-adrenoceptor blocking agent pindolol and the diuretic clopamide; each component lowers blood pressure through a different mechanism of action. Clinical studies have shown that the combination is an effective and well-tolerated antihypertensive agent, that both components contribute to this effect, and that the combination is more effective than pindolol alone.

Pindolol is a specific beta-adrenoceptor blocking agent with some intrinsic sympathomimetic activity which minimises myocardial depression and other undesirable effects of beta-blockade, including bradycardia and bronchoconstriction. Clopamide, in the dosage present in Viskaldix, contributes to a lowering of blood pressure without marked diuresis. The hypotensive effect of the combination is often seen after five to seven days but the maximum effect may not be achieved for two to three weeks.

Indications: Mild to moderate hypertension.

Dosage and administration 1 tablet daily in the morning. If blood pressure is not satisfactorily lowered after two to three weeks, two tablets may be taken as a single dose in the morning. A maximum dose of three tablets daily may be taken if necessary.

Contra-indications, warnings, etc

Contra-indications: Cardiac failure unless satisfactorily controlled by digitalis (see also precautions). Atrioventricular block, pronounced bradycardia, obstructive pulmonary disease, cor pulmonale, severe renal or hepatic failure, metabolic acidosis, prolonged fasting, hypokalaemia, pregnancy.

Viskaldix should not be taken in conjunction with agents which inhibit calcium transport, e.g. verapamil, during concomitant administration of lithium, or by patients with known hypersensitivity to sulphonamides.

Precautions: Patients with a poor cardiac reserve should be stabilised with digitalis before treatment with Viskaldix to prevent impairment of myocardial contractility. Viskaldix should be used with caution in patients with a

history of bronchial asthma or recent myocardial infarction and also in patients with spontaneous hypoglycaemia and diabetics under treatment with insulin or oral hypoglycaemic agents. Viskaldix should be administered during breast feeding only in compelling circumstances.

During treatment with Viskaldix, patients should not undergo anaesthesia with agents causing myocardial depression (e.g. halothane, cyclopropane, trichlorethylene, ether, chloroform). Viskaldix should be gradually withdrawn before elective surgery. In emergency surgery or cases where withdrawal of Viskaldix would cause deterioration in cardiac condition, atropine sulphate 1–2 mg intravenously should be given to prevent severe bradycardia.

If a beta-blocker is indicated in a patient with a pheochromocytoma it must always be given in conjunction with an alpha-blocker. Pre-existing peripheral vascular disorders may be aggravated by beta-blockers.

In severe renal failure a further impairment of renal function following beta-blockade has been reported in a few cases. Potassium levels should be checked in patients with kidney or liver failure, and urate levels in patients suffering from gout.

There have been reports of skin rashes and/or dry eyes associated with the use of beta-adrenoceptor blocking drugs. The reported incidence is small and in most cases the symptoms have cleared when treatment was withdrawn. Discontinuance of the drug should be considered if any such reaction is not otherwise explicable. Cessation of therapy with a beta-blocker should be gradual.

Overdosage: Overdosage may cause alterations in heart rate, nausea, vomiting, orthostatic disturbances, collapse, hypokalaemia and its accompanying disorders.

Treat by elimination of any unabsorbed drug and general supportive measures. Plasma electrolytes should be closely monitored. Marked bradycardia, as a result of overdosage or idiosyncrasy, should be treated with atropine sulphate 1–2 mg intravenously. If necessary, isoprenaline hydrochloride can be administered by slow intravenous injection, and under constant supervision, beginning with 25 mcg (5 mcg/min) until the desired effect is achieved. A cardiac pacemaker may be required.

Intravenous glucagon (5–10 mg) has been reported to overcome some of the features of serious overdosage with beta-blockers and may be useful.

Side-effects: Few serious side-effects have been reported. Depression, diarrhoea, insomnia, headaches, sleep disturbance, epigastric pain, fatigue, dizziness, hypotension have occurred but are usually transient and disappear if dosage is reduced.

Pharmaceutical precautions Nil.

Legal category POM.

Package quantities Calendar pack of 28.

Product licence number 0101/0113.

VISKEN*

Presentation *5 mg Tablets:* Visken 5 mg is available as white, round, flat, bevel-edged tablets of 7 mm diameter, and weighing 120 mg. Branded 'SANDOZ' on one side, and coded 'LB' with a single break line on the reverse. Each tablet contains 5 mg of pindolol base.

15 mg Tablets: Visken 15 mg is available as white, round, flat, bevel-edged tablets of 9 mm diameter and weighing 200 mg. Branded SANDOZ on one side, and coded JU

with a single break line on the reverse. Each tablet contains 15 mg of pindolol base.

Uses *Principal action:* Visken is a specific beta-adrenoreceptor blocking agent with low cardiodepressant activity at therapeutic dose. Its beta-blocking activity prevents excessive sympathetic drive to the heart, resulting in a fall in heart rate, and a decrease in cardiac work and myocardial oxygen consumption. Visken possesses some intrinsic sympathomimetic activity even at low dosage which may prevent reduction of resting sympathetic tone to an undesirably low level and minimise myocardial depression.

Indications: **Hypertension:** For reduction of blood pressure in essential hypertension. Onset of action of Visken is usually rapid, most patients showing a response within the first one to two weeks of treatment.

However, maximum response may take several weeks to develop.

Angina pectoris: Prophylactic treatment with Visken reduces the frequency and severity of anginal attacks and increases work capacity.

Dosage and administration *Hypertension:* Initially one 15 mg tablet daily, with breakfast or 5 mg two or three times daily. Most patients respond to a once-daily dose of from 15 mg to 30 mg.

If necessary, dosage may be increased at weekly intervals up to a maximum of 45 mg daily in single or divided doses. Patients not responding after three to four weeks at this dosage level rarely benefit from further elevations in dosage. Addition of Visken to existing diuretic therapy increases the hypotensive effect and combination with other anti-hypertensives enables reduction in dosage of these agents.

Angina pectoris: Usually half to one 5 mg tablet up to three times a day according to response.

Contra-indications, warnings, etc

Contra-indications: Cardiac failure unless satisfactorily controlled by digitalis (see also 'Precautions').

Atrio-ventricular block pronounced bradycardia, obstructive pulmonary disease cor pulmonale, metabolic acidosis, prolonged fasting, severe renal failure, pregnancy.

Visken should not be taken in conjunction with agents which inhibit calcium transport, e.g. verapamil.

Precautions: Patients with a poor cardiac reserve should be stabilised with digitalis before treatment with Visken to prevent impairment of myocardial contractility.

As with all beta-blockers, Visken should be used with caution in patients with a history of bronchial asthma or recent myocardial infarction and in the treatment of patients with spontaneous hypoglycaemia and diabetics under treatment with insulin or oral hypoglycaemic agents. Visken should be administered during breast feeding only in compelling circumstances.

During treatment with Visken patients should not undergo anaesthesia with agents causing myocardial

depression (e.g. halothane, cyclopropane, trichlorethylene, ether, chloroform). Visken should be gradually withdrawn before elective surgery. In emergency surgery or cases where withdrawal of Visken would cause deterioration in cardiac condition, atropine sulphate 1-2 mg intravenously should be given to prevent severe bradycardia.

If a beta-blocker is indicated in a patient with a pheochromocytoma it must always be given in conjunction with an alpha-blocker. Pre-existing peripheral vascular disorders may be aggravated by beta-blockers.

In severe renal failure a further impairment of renal function following beta blockade has been reported in a few cases.

There have reports of skin rashes and/or dry eyes associated with the use of beta-adrenoreceptor blocking drugs. The reported incidence is small and in most cases the symptoms have cleared when treatment was withdrawn. Discontinuance of the drug should be considered if any such reaction is not otherwise explicable. Cessation of therapy with a beta-blocker should be gradual.

Overdosage: Treat by elimination of any unabsorbed drug and general supportive measures. Marked bradycardia as a result of overdosage or idiosyncrasy should be treated with atropine sulphate 1-2 mg intravenously. If necessary, isoprenaline hydrochloride can be administered by a slow intravenous injection and under constant supervision beginning with 25 mcg (5 mcg/min) until the desired effect is achieved. A cardiac pacemaker may be required; i.v. glucagon (5-10 mg) has been reported to overcome some of the features of serious overdosage and may be useful.

Side-effects: Few serious side-effects have been reported. Depression, diarrhoea, insomnia, headaches, sleep disturbance, epigastric pain, fatigue, dizziness, hypotension have occurred but are usually transient and disappear if the dosage is reduced. Allergic skin reactions have occasionally been reported.

Pharmaceutical precautions Nil.

Legal category POM.

Package quantities 5 mg tablets: Containers of 100.
15 mg tablets: Containers of 30.

Further information Since Visken is a specific adrenergic beta-receptor blocking agent, effective control of the blood pressure can be achieved without inducing the problems often associated with other antihypertensive therapy, e.g. postural and effort hypotension, impotence and sedation. Many patients treated with Visken have reported an increased sense of well-being.

ELANTAN® 20 ▼

Presentation White tablets with break score, containing 20 mg Isosorbide mononitrate.

Uses Prophylaxis of angina pectoris.

Dosage and administration Long term treatment, 1 tablet three times a day after meals taken unchewed with a little fluid. The dosage can be increased to two tablets three times a day.

Contra-indications, warnings, etc Elantan should not be used in cases of: acute myocardial infarction with low filling pressures; acute circulatory failure; very low blood pressure. The drug should not be used during the first three months of pregnancy except under the direction of a doctor. Symptoms of circulatory collapse may arise after the first dose in patients with labile circulation; nitrate headache may also occur. Both symptoms can be largely avoided if the treatment is started with half a tablet of Elantan morning and evening.

Reaction capacity may be reduced if alcohol is consumed during treatment.

Pharmaceutical precautions No special storage conditions are necessary.

Legal category POM.

Package quantities Elantan is blister-packed in cartons of 50 and 100 tablets.

Further information Isosorbide mononitrate is the British approved name for isosorbide-5-mononitrate.

Product licence number 4438/0005.

ISOKET® I.V.

Presentation Isoket IV is supplied as ampoules containing Isosorbide dinitrate in 10 ml colourless, sterile, isotonic saline and in bottles containing 100 mg Isosorbide dinitrate in 100 ml colourless, sterile, isotonic saline. The solutions contain no alcohol.

Uses Isoket is indicated in the treatment of unresponsive left ventricular failure secondary to acute myocardial infarction, unresponsive left ventricular failure of various aetiology and severe or unstable angina pectoris.

Isosorbide dinitrate has a relaxant action on the smooth musculature, especially in the blood vessels. The major site of action comprises the peripheral capacitance veins, the dilation of which leads to a reduced return of blood to the heart. This applies to both the systemic and pulmonary circulations. At the same time, the resistance arterial vessels also become dilated, though to a lesser degree. As a result of these actions there is a favourable effect on all conditions associated with elevated ventricular pressure and a consequent reduction in the workload of the heart, with a reduction in myocardial oxygen consumption.

Therapeutic doses of Isoket produce a reduction in left ventricular end diastolic pressure and left ventricular end diastolic volume. By reduction of the previously elevated ventricular wall tension, the intramural coronary vessels, even in the post-stenotic area, can fill better during diastole. The endocardial region, which is particularly endangered by ischaemia then receives an improved blood supply. The myocardium, previously overstressed by the elevated preload, then resumes its normal action, either wholly or partly, depending of course on the severity and extent of the anatomical injury.

Isosorbide dinitrate has been shown to improve the effective renal plasma flow index and to increase urine flow in patients with congestive heart failure, possibly due to a normalization of blood flow distribution in the kidney. The dilation of the coronary vessels following Isoket administration is of clinical relevance in cases of angina pectoris due to coronary artery spasm.

Dosage and administration *Dosage:* The dose employed must be adjusted according to the patient's response. In general, a dose of between 2 and 7 mg per hour is suitable, although doses as high as 10 mg per hour may be necessary.

Children: The safety and efficacy of Isoket has not yet been established in children.

Administration: Isoket is a concentrated solution and should never be injected directly as a bolus. It should always be administered as an intravenous admixture with a suitable vehicle such as Sodium Chloride Injection B.P. or Dextrose Injection B.P. Prepared Isoket admixtures are always given by intravenous infusion or with the aid of an infusion pump. During administration, there should be close monitoring of the patient's blood pressure and pulse. Admixtures are prepared by exchanging the required volume of Isoket with an equal volume of the infusion vehicle. For example, if a dose of 6 mg per hour is required, 50 ml of Isoket (equivalent to 5×10 ml ampoules) should be added to 450 ml of the infusion vehicle to give a final volume of 500 ml. This admixture now contains 1 mg in 10 ml and the required dosage can be obtained by giving 60 ml per hour which is equivalent to a drip rate of 60 paediatric microdrops per minute or 20 standard drops per minute. This drip rate provides enough solution for an infusion time of 8 hours and 20 minutes.

When it is necessary to further reduce the fluid intake, a more concentrated solution may be obtained by using one bottle (100 mg Isosorbide dinitrate) of Isoket IV made up to 500 ml. This gives a final concentration of 200 mg/ml. The Isoket IV should be added to the infusion solution immediately after opening the admixture should be made up under aseptic conditions.

Contra-indications, warnings

Contra-indications: Isoket should not be used in the treatment of cardiogenic shock unless some means of

maintaining an adequate diastolic aortic pressure are undertaken. Isoket is contra-indicated in circulatory collapse and severe hypotension.

Precautions: Close attention to pulse and blood pressure is necessary during the administration of Isoket infusions.

Adverse Effects: Whilst sharp falls in systemic arterial pressure can give rise to symptoms of cerebral flow deficiency and decreased coronary perfusion, clinical experience with Isoket has shown that this is not normally a problem. This is consistent with the known vasodilatory effects of Isosorbide dinitrate which occur predominantly on the venous rather than the arterial side of the circulation. In common with other nitrates, headache and nausea may occur during administration.

Pharmaceutical precautions

Compatibility: Isoket contains Isosorbide dinitrate in isotonic saline and is compatible with commonly employed infusion solutions. No incompatibilities have so far been demonstrated.

Isoket is compatible with glass infusion bottles and infusion packs made of polyethylene, e.g. Polyfusor* (Boots), or Bottle-paks* and Flat-Paks* distributed by Dylade of Runcorn, Cheshire.

Isoket may be infused slowly using a syringe pump with a glass or rigid plastic syringe (Gillette Sabre syringe or Brunswick Disposable Plastipak* syringes). Isoket is incompatible with infusion bags and administration sets made from PVC and a loss of activity of up to 40% is possible on prolonged contact, e.g. 8 hours. Loss after 1 hour is approximately 30%. The use of PVC containers should therefore be avoided, e.g. Vialflex* (Travenol) or Steriflex* (Boots).

Legal category POM.

Package quantities Each pack contains 10 × 10 ml ampoules.

Bottles: Each pack contains 4 × 100 ml bottles.

Further information Nil.

Product licence number 4438/0001

ISOKET RETARD*

Presentation Circular yellow tablets, scored on one side, and containing 20 mg Isosorbide dinitrate in a sustained release formulation.

Uses For the prevention of anginal attacks.

Dosage and administration The tablets are for oral administration. The deep score-line permits easy division of the tablets when low dosages are prescribed.

The usual dose for long-term treatment is one tablet every 12 hours; the tablets should be swallowed without chewing. Up to four tablets daily may be taken if necessary.

For controlling an anginal attack, half a tablet should be chewed and left to dissolve in the mouth.

Contra-indications, warnings, etc

Contra-indications: A history of sensitivity to the drug. Very low blood pressure.

Warnings: Headaches may develop in sensitive persons and these may be minimized by commencing with low gradually increasing doses. Cutaneous vasodilatation postural hypotension and dry rashes may occasionally occur.

Precautions: Alcohol intake may enhance the effect of the drug and induce hypotension. During the first three months of pregnancy drugs should only be used if absolutely essential.

Pharmaceutical precautions Store in a cool, dry place.

Legal category P.

Package quantities The tablets are supplied in blister-packs of 50 tablets.

Further information Isosorbide dinitrate is a long acting substance and the special sustained release formulation of Isoket Retard tablets permits onset of action within 20 minutes and a duration of up to 12 hours.

LIBRAXIN*

Presentation Round, yellow-green, film-coated tablets with 'LIBRAXIN' imprinted on one face, containing 5 mg chlordiazepoxide and 2.5 mg clidinium bromide.

Uses Properties: Libraxin combines the anti-anxiety properties of Librium* and the antispasmodic and antisecretory properties of clidinium bromide. Accepted concepts of gastro-intestinal physiology and physiology recognise two important components in gastro-intestinal dysfunction: the emotional factor and the somatic factor. Librium is an effective and well-tolerated drug for the treatment of patients in whom anxiety and tension are contributory or causative factors in a psychosomatic illness. Clidinium bromide is a synthetic anticholinergic agent which has been shown in experimental and clinical studies to have a pronounced antispasmodic and antisecretory effect on the gastro-intestinal tract. Its anticholinergic action appears to be approximately equal to that of atropine but its side-effects are milder and less frequent.

Indications: For the control of hypersecretion, hypermotility and emotional factors associated with gastro-intestinal disorders, such as nervous dyspepsia, peptic ulcer, cardiospasm, pylorospasm, irritable bowel syndrome.

Dosage and administration Adults: 1 or 2 tablets three or four times daily – before meals and at bedtime. The majority of patients, 1 tablet three times daily gives excellent results. In elderly patients it is recommended that the initial dose be 1 tablet twice daily.

Children: No dosage recommendations are made for the administration of Libraxin to children. Libraxin Tablets are for oral administration.

Contra-indications, warnings, etc

Contra-indications: Because of its anticholinergic effects, Libraxin should not be given to patients suffering from glaucoma or prostatic enlargement.

Precautions: With Libraxin, as with other drugs acting on the central nervous system, patients should be cautioned to avoid alcohol while under treatment, since the individual response cannot be foreseen. Like all sedatives of this type, Libraxin may modify patients' reactions (driving ability, operation of machinery, etc) to a varying extent, depending on dosage and individual susceptibility.

The established medical principle of prescribing sedatives in early pregnancy only when absolutely indicated should be observed.

Side-effects: Libraxin is very well tolerated. Minor side-effects are infrequent and are controlled by reduction of dosage. They include drowsiness, muscle weakness, dryness of the mouth, blurring of vision, constipation and hesitancy of micturition.

While blood dyscrasias and jaundice have been reported to have occurred during Librium therapy, evidence is inconclusive that these were related to the administration of Librium.

Effects of overdosage and their treatment: Primary signs and symptoms of overdosage may include drowsiness, confusion, dry mouth, urinary retention, dilated pupils and coma.

Gastric lavage should be performed within a few hours of ingestion, and symptoms treated as they arise. Pilocarpine is an antidote to clidinium overdosage. Noradrenaline may be given to correct hypotension, if it develops, and Valium* Roche or pentobarbitone sodium for severe excitement states.

Pharmaceutical precautions *Storage:* Libraxin Tablets should be stored in well-closed containers. The recommended maximum storage temperature for Libraxin Tablets is 30°C.

Legal category POM.

Package quantities Libraxin Tablets in packings of 100 and 500.

Further information Nil.

Product licence number 0031/5024.

LIBRIUM*

Presentation Capsules with opaque green cap and opaque yellow body marked 'LIBRIUM', containing 5 mg chlordiazepoxide hydrochloride.

Capsules with black cap and opaque green body marked 'LIBRIUM', containing 10 mg chlordiazepoxide hydrochloride.

Round, yellowish-green, film-coated tablets marked 'LIBRIUM', containing 5 mg chlordiazepoxide.

Round, pale green, film-coated tablets marked 'LIBRIUM', containing 10 mg chlordiazepoxide.

Round, deep green, film-coated tablets marked 'LIBRIUM', containing 25 mg chlordiazepoxide.

Ampoules containing 100 mg chlordiazepoxide (in the form of 112 mg chlordiazepoxide hydrochloride) accompanied by ampoules of 2 ml of solvent.

Uses Properties: Librium has tranquillising properties with a specific anxiolytic action. It also possesses muscle-relaxant and anticonvulsant properties.

Indications: Acute and chronic anxiety states and agitation; obsessive-compulsive neuroses and panic states; psychosomatic and organic illness with associated anxiety, e.g. angina pectoris, peptic ulcer, skin disorders; alcoholic psychoses (including delirium tremens); tension headaches; insomnia; nocturnal enuresis; behaviour disorders; musculoskeletal disorders;

spastic conditions; epilepsy (as adjuvant to treatment); premedication.

Dosage and administration *Capsules and Tablets* – *Adults*: Mild anxiety neuroses; anxiety associated with organic disease; neuromuscular spasm – 30 mg daily in divided doses.

Severe anxiety neuroses; phobias; acute agitation; obsessive-compulsive syndrome – 40–100 mg daily in divided doses.

Elderly and debilitated patients – 10 mg daily initially.

Children: 5–20 mg daily in divided doses.

Librium Capsules and Tablets are for oral administration.

Ampoules – *Adults*: Symptomatic relief of acute episodes in the chronic alcoholic (delirium tremens) – 50–100 mg by intramuscular injection, repeated if necessary in two to four hours.

Rapid relief of acute anxiety, phobia or panic reactions – 50–100 mg by intramuscular injection, followed by 25–100 mg three or four times daily if necessary.

Intramuscular injection: Add 2 ml of the special solvent to the contents of one 5 ml dry-filled amber ampoule of Librium hydrochloride sterile powder. Avoid excessive pressure in injecting the solvent into the ampoule containing the Librium as this may cause bubbles to form on the surface of the solution. Agitate gently until completely dissolved. The solution should be prepared immediately before administration and should be colourless to pale yellow when reconstituted. Administer slowly by deep intramuscular injection.

Caution: Librium preparations made with the special solvent should **not** be given intravenously. Do not use the solvent if opalescent or hazy.

Librium ampoules made with the special solvent should not be diluted.

Contra-indications, warnings, etc *Precautions*: Potentiation of alcohol by Librium has not been demonstrated, but with Librium, as with other drugs acting on the central nervous system, patients should be instructed to avoid alcohol while under treatment, since the individual response cannot be foreseen. Like all medicaments of this type, Librium may modify patients reactions (driving ability, operation of machinery, etc) to a varying extent, depending on dosage, administration and individual susceptibility.

The use of high doses of benzodiazepines, especially over prolonged periods, may sometimes lead to dependence, particularly in patients with a history of alcoholism or drug abuse. Treatment in these cases should be withdrawn gradually.

Results obtained in trials with several generations of mice, rats, rabbits and dogs indicate that no danger of teratogenic effects need be expected from therapeutic doses of Librium. Nevertheless, the established medical principle of prescribing medicaments in early pregnancy only when absolutely indicated should be observed.

Side effects: Librium is very well tolerated. Minor side-effects such as ataxia and drowsiness have been reported during early treatment and occur most commonly in elderly or debilitated patients. These can be controlled by reduction of dosage.

While blood dyscrasias and jaundice have been reported to have occurred during Librium therapy, evidence is inconclusive that these were related to the administration of Librium.

Effects of overdosage and their treatment: Reported experience of inadvertent or deliberate overdosage indicates that these present virtually no problem. Dose of up to approximately 2.5 g have produced no long term ill-effects. Drowsiness, ataxia and dysarthria may occur, with coma in severe cases.

Treatment is symptomatic, but gastric lavage may be useful if performed soon after ingestion.

Pharmaceutical precautions *Storage*: Librium Capsules and Tablets should be stored in well-closed containers and protected from light. The recommended maximum storage temperature for Librium Capsules is 30°C and for Librium Tablets is 25°C.

Librium Ampoules should be kept in a refrigerator.

Legal category POM.

Package quantities Librium Tablets 5 mg, 10 mg and 25 mg in packings of 100 and 500.

Librium Capsules 5 mg and 10 mg in packings of 10 and 500.

Librium Ampoules 100 mg accompanied by ampoule with 2 ml solvent in boxes of 10.

Further information Nil.

LIMBITROL*

Presentation Limbitrol 5 Capsules with opaque green cap and opaque pink body marked 'LIMBITROL' containing 5 mg chlordiazepoxide and 14.15 mg amitriptyline hydrochloride (equivalent to 12.5 mg amitriptyline base).

Limbitrol 10 Capsules with opaque, dark green cap and opaque pink body marked 'LIMBITROL', containing 10 mg chlordiazepoxide and 28.3 mg amitriptyline hydrochloride (equivalent to 25 mg amitriptyline base).

Uses *Properties*: Limbitrol combines the anxiolytic effect of chlordiazepoxide with the antidepressant action of amitriptyline.

Indications: The treatment of the symptoms of depressive illness with associated anxiety.

Dosage and administration *Adults*: It is recommended that patients should be started on one capsule Limbitrol 5 three times daily. If the response is inadequate the dose should be increased to one capsule Limbitrol 10 three times daily.

In more severe cases it may be necessary to initiate treatment with one capsule Limbitrol 10 three times daily. If necessary, dosage may be increased to two capsules three times daily.

Elderly patients: Limbitrol is not for geriatric use.

Children: Limbitrol is not for paediatric use.

Limbitrol Capsules are for oral administration.

Contra-indications, warnings, etc

Contra-indications: Patients with known sensitivity to benzodiazepines; acute pulmonary insufficiency.

Recent myocardial infarction; heart block of any degree; cardiac arrhythmias. Patients with mania, whose condition may be exacerbated by tricyclic antidepressants.

Precautions: In patients with chronic pulmonary insufficiency, and patients with chronic renal or hepatic disease, dosage may need to be modified.

The use of Limbitrol during pregnancy, especially in the first trimester, should be avoided.

The administration of high doses or prolonged administration of low doses of benzodiazepines in the last trimester of pregnancy and during labour has been reported to produce irregularities in the foetal heart, and hypotonia, poor sucking and hypothermia in the neonate.

Tricyclic antidepressants, when administered during the last trimester of pregnancy, have also been associated with adverse effects such as withdrawal symptoms, respiratory depression and agitation in the foetus.

Chlordiazepoxide and amitriptyline may appear in breast milk. Limbitrol should therefore be avoided during lactation.

Because of its anticholinergic effects Limbitrol should not be given to patients suffering from narrow angle glaucoma or symptoms suggestive of prostatic hypertrophy.

Limbitrol should be avoided in patients with a history of epilepsy.

If Limbitrol is combined with centrally-acting drugs such as neuroleptics, tranquillizers, antidepressants, hypnotics, analgesics and anaesthetics, the sedative effects may be intensified.

Patients should be advised that, like all medicaments of this type, Limbitrol may modify patients' performance of skilled tasks (driving, operating machinery, etc.) to a varying degree depending on dosage, administration and individual susceptibility. Patients should further be advised that alcohol may intensify any impairment and should therefore be avoided during treatment.

Anaesthesia given during tricyclic antidepressant therapy may increase the risk of arrhythmias and hypotension. If anaesthesia is necessary, the anaesthetist should be informed that the patient is being treated with imbitrol.

Limbitrol should not be taken with monoamine oxidase inhibitors, or within two weeks of cessation of therapy with monoamine oxidase inhibitors.

Amitriptyline may decrease the antihypertensive effect of adrenergic neurone-blocking drugs such as guanethidine, bethanidine or debrisoquine (Declinax[®]), and possibly also clonidine. It is advisable to review all antihypertensive therapy during treatment with imbitrol.

Limbitrol should not be given with sympathomimetic agents such as adrenaline, ephedrine, isoprenaline, oradrenaline, phenylephrine and phenylpropanolamine.

Barbiturates may decrease and methylphenidate may increase the antidepressant action of amitriptyline.

The possibility of suicide in depressed patients should be borne in mind, and patients should be carefully supervised, especially during the early stages of treatment.

Withdrawal symptoms are known to occur on abrupt cessation of benzodiazepine drugs and amitriptyline when given alone. However, withdrawal symptoms have not been reported after termination of Limbitrol treatment. Nevertheless, following prolonged use, particularly at high dosage, Limbitrol should be withdrawn gradually.

The efficacy and safety of Limbitrol in elderly patients has not been demonstrated.

The fixed dosage of chlordiazepoxide and amitriptyline provided in Limbitrol may not be appropriate for some patients, for whom the alternative of prescribing the two active ingredients separately in the necessary amounts should be considered.

Side-effects: The most common side-effects are drowsiness, dry mouth and dizziness during the first few days of treatment, and anticholinergic effects such as constipation, disturbances of accommodation, tachycardia and hesitancy of micturition, which also usually lessen or disappear with time.

Other adverse effects are rare and include headache, hypotension, gastro-intestinal upsets, skin rashes, tremor, interference with sexual function, and urinary retention. Isolated cases of blood dyscrasias, jaundice, hypomania, convulsions, and peripheral neuropathy have also been reported.

Cardiac arrhythmias and severe hypotension are likely to occur with high dosage and in deliberate overdosage of amitriptyline. They may also occur with normal dosage in patients with pre-existing heart disease.

Psychotic manifestations, including mania and paranoid delusions, may be exacerbated during treatment with tricyclic antidepressants.

Treatment of overdosage: Deaths by deliberate or accidental overdosage of amitriptyline have occurred. Symptoms of amitriptyline overdosage may include drowsiness, stupor and coma; tachycardia and other cardiac arrhythmias including ventricular fibrillation; severe hypotension and congestive cardiac failure; agitation, hyper-reflexia and convulsions; hyperpyrexia, dilated pupils and paralytic ileus.

Symptoms of chlordiazepoxide overdosage may include drowsiness, ataxia and dysarthria, with coma in severe cases.

Treatment is symptomatic and supportive. Gastric lavage should be performed as quickly as possible and followed by the use of activated charcoal. Maintain an open airway and adequate fluid intake. Continuous ECG monitoring is essential; serious cardiac arrhythmias may be treated with neostigmine (Prostigmin[®]), pyridostigmine (Mestinon[®]) or propranolol. Intravenous fluids may be required to maintain the blood pressure. Body temperature should be regulated. Intravenous diazepam (Valium Roche[®]) is recommended for the control of convulsions.

There is no specific antidote to amitriptyline and chlordiazepoxide overdosage but the intravenous administration of physostigmine (1 to 3 mg) has been reported to reverse the symptoms. This dose should be repeated as indicated.

When taken with centrally-depressant drugs, especially alcohol, the effects of overdosage are likely to be more severe.

Pharmaceutical precautions *Storage:* Recommended maximum storage temperature 30°C.

Legal category POM.

Package quantities Limbitrol 5 Capsules in packings of 100 and 500.

Limbitrol 10 Capsules in packings of 100 and 500.

Limbitrol 5 Capsules 0031/5066R

Limbitrol 10 Capsules 0031/5067R

RIVOTRIL*

Presentation Round, pale orange tablets with 'RIVOTRIL' imprinted on one face and two break bars on the other, containing 0.5 mg clonazepam.

Round, white tablets with 'RIVOTRIL' imprinted on one face and two break bars on the other, containing 2 mg clonazepam.

Ampoules containing 1 mg clonazepam in 1 ml solvent, each accompanied by an ampoule containing 1 ml Water for Injection USP as a diluent. The ampoule solution is colourless.

Uses *Properties:* Rivotril is a benzodiazepine derivative exhibiting marked anticonvulsant properties. These have been demonstrated in the many tests in animals which are employed to establish the anti-epileptic properties of a drug. Animal experiments and electroencephalographic studies in man have shown that Rivotril prevents generalisation of convulsive activity and raises the seizure threshold. In many cases, abnormal electroencephalograms become normal. Rivotril improves both focal seizures and primarily generalised attacks. Administered intravenously, Rivotril quickly controls status epilepticus.

Indications: All clinical forms of epileptic disease and seizures in infants, children or adults, especially: typical or atypical petit mal; generalised primary or secondary tonic-clonic seizures including grand mal; status epilepticus in all clinical forms; focal seizures with elementary or complex symptomatology, various forms of myoclonus and associated abnormal movements.

Dosage and administration *Tablets:* Treatment should be started with low doses. These should not exceed 1 mg/day for adults, 0.5 mg/day for children and 0.25 mg/day for infants and small children. If desired, the total dose may be given at night for the first four days of treatment. The dose may be increased progressively until the maintenance dose suited to the individual patient has been found.

The dosage of Rivotril must be adjusted to the needs of each individual and depends on the age of the patient and the individual response to therapy. The maintenance dosage must be determined according to clinical response and tolerance.

The normal daily dosage for various age groups falls in the following ranges:

Adults	4–8 mg
School children (5–12 years)	3–6 mg
Small children (1–5 years)	1–3 mg
Infants (0–1 year)	0.5–1 mg

These are total daily dosages which should be divided into three or four doses taken at intervals throughout the day. If necessary, larger doses may be given at the discretion of the physician. The maintenance dose should be attained after two to four weeks of treatment.

In some forms of childhood epilepsy, certain patients may cease to be adequately controlled by Rivotril. Control may be re-established by increasing the dose, or interrupting treatment with Rivotril for two to three weeks. During the interruption in therapy careful observation and other drugs may be needed.

Simultaneous administration of more than one anti-epileptic drug is a common practice in the treatment of epilepsy and may be undertaken with Rivotril. The dosage of each drug may be required to be adjusted to obtain the optimum effect. If status epilepticus occurs in

a patient receiving oral R still control the status.

Rivotril Tablets are for

Ampoules: for the treatment dose and rate of administration response of the patient.

Adults: 1 mg (1 ampoule 1 ampoule of diluent) by
Infants and children: 0.5 active substance mixed slow intravenous injection

This dose should be given by slow intravenous

Intravenous injection in vein of the antecubital given slowly – in adult: seconds. This will result hypotension or apnoea or for resuscitation should.

The contents of the Water for Injection USP of the other ampoule, in 1 ml, IMMEDIATELY

Rivotril Ampoule solution in intravenous infusions: customary in the treatment up to 3 mg (3 ampoule solutions is permissible: Dextrose Injection BP 1 and Dextrose Injection 1 2.5% dextrose). This infusion freshly and used within

Rivotril Ampoules are

Maintenance of stable Rivotril Ampoule solution

Contra-indications.

Since alcohol can provoke of therapy, patients should avoid alcohol while under Rivotril, alcohol may not compromise the success: unpredictable side-effects

As a general rule, epileptic drive. Even when adequate should be remembered alteration in timings of reactions, depending on patient is allowed to operate be warned of these possibilities

When Rivotril is used with epileptic drugs, side-effects evident, particularly with combinations include care in adjusting dosage

As with all other anti-epileptic drugs Rivotril must not be abruptly withdrawn by gradual reduction must also be taken while the patient is still on

Although results obtained from studies of rats and rabbits indicate no teratogenic effects need doses of Rivotril, the phases and disadvantages of pregnancy.

Side-effects: The side-effects: drowsiness, somnolence, occu

co-ordination disturbances. Such effects are usually transitory and disappear spontaneously as treatment continues or with dosage reduction. They tend to occur early in treatment and can be greatly reduced, if not avoided, by commencing with low dosages followed by progressive increases.

In infants and small children, and particularly those with a degree of mental impairment. Rivotril may give rise to salivary or bronchial hypersecretion with drooling. Supervision of the airway may be required.

Extensive clinical and laboratory investigations have revealed no significant changes in the blood picture or renal or hepatic function following treatment with Rivotril.

Rivotril may affect the behaviour of epileptic patients. Paradoxical effects such as aggressiveness, irritability or agitation have been reported as well as grand mal or stimulation of a new type of seizure. Conversely, improvement in behaviour may be observed in some patients suffering from certain behavioural forms of epilepsy.

Effects of overdosage and their treatment: As with other benzodiazepine drugs, overdosage should not present undue problems of management or threat to life. Patients have recovered from overdoses in excess of 60 mg without special treatment. Severe somnolence with muscle hypotonia will be present. Treatment is symptomatic and may include the need to maintain an airway. Gastric lavage may be useful if performed soon after ingestion.

harmaceutical precautions *Storage:* Rivotril Tablets should be stored in well-closed containers, in a cool place. Rivotril Tablets and Ampoules should be protected from light.

Legal category POM.

Package quantities Rivotril Tablets 0.5 mg in packages of 100 and 500.

Rivotril Tablets 2 mg in packages of 100 and 500.

Rivotril Ampoules 1 mg in packages of 10, accompanied by 1 ml ampoules Water for Injection USP as solvent.

Further information Nil.

OHYPNOL* ▼

Presentation A purple film-coated, bi-convex diamond-shaped tablet with a single break bar on one side and 'ROHYPNOL' on the other side, containing 1 mg of nitrazepam.

Uses *Properties:* Rohypnol is a benzodiazepine compound with hypnotic properties.

Indications: The short-term treatment of sleep disturbances, particularly in patients who have difficulty in falling asleep.

The induction of sleep at unusual times on a short-term or irregular basis.

Dosage and administration *Adults:* 0.5–1 mg before retiring.

Adults with severe sleep disturbances: 1–2 mg.

Elderly or debilitated patients: It is recommended that the initial dose to be taken before retiring should not exceed 0.5 mg; tolerability at this dosage level is excellent. In exceptional cases, where the hypnotic effect is less than adequate but tolerability is satisfactory, the dose may be increased to 1 mg.

Rohypnol tablets are not for paediatric use.

Rohypnol tablets are for oral administration.

Contra-indications, warnings, etc

Contra-indications: Patients with known sensitivity to benzodiazepines; acute pulmonary insufficiency; respiratory depression.

Precautions: In patients with chronic pulmonary insufficiency, and in patients with chronic renal or hepatic disease, dosage may need to be reduced.

The use of Rohypnol during pregnancy should be avoided.

The administration of high doses or prolonged administration of low doses of benzodiazepines in the last trimester of pregnancy or during labour has been reported to produce irregularities in the foetal heart, and hypotonia, poor sucking and hypothermia in the neonate.

Rohypnol has been detected in breast milk. If possible, the use of Rohypnol should be avoided during lactation.

If Rohypnol is combined with centrally-acting drugs such as neuroleptics, tranquilizers, antidepressants, hypnotics, analgesics and anaesthetics, the sedative effects may be intensified.

Patients should be advised that, like all medicaments of this type, Rohypnol may modify patients' performance at skilled tasks (driving, operating machinery, etc.) to a varying degree depending upon dosage and individual susceptibility. Patients should further be advised that alcohol may intensify any impairment and should, therefore, be avoided during treatment.

The dependence potential of the benzodiazepines is low but this increases when high doses are used, especially when given over long periods. This is particularly so in patients with a history of alcoholism or drug abuse or in patients with marked personality disorders. Regular monitoring in such patients is essential; routine repeat prescriptions should be avoided and treatment should be withdrawn gradually. Symptoms such as depression, nervousness, rebound insomnia, irritability, sweating, and diarrhoea have been reported following abrupt cessation of treatment with normal therapeutic doses.

In rare instances, withdrawal following excessive dosages may produce confusional states, psychotic manifestations and convulsions.

Abnormal psychological reactions to benzodiazepines have been reported. Rare behavioural effects include paradoxical aggressive outbursts, excitement, confusion and the uncovering of depression with suicidal tendencies.

Side-effects: Adverse effects include drowsiness, unsteadiness and ataxia; these are dose-related and are likely to be uncommon with the recommended dosage. The elderly are particularly sensitive to the effects of central depressant drugs and may experience confusion. If organic brain changes are present, the dosage of Rohypnol should not exceed 0.5 mg in these patients.

Other adverse effects are less common and include headache, vertigo, hypotension, gastro-intestinal upsets, skin rashes, visual disturbances, changes in libido, and urinary retention. Isolated cases of blood dyscrasias and jaundice have also been reported.

Treatment of overdosage: When taken alone in overdosage Rohypnol presents few problems in management. Signs may include drowsiness, ataxia, and dysarthria, with coma in severe cases. Treatment is symptomatic. Gastric lavage is useful only if performed soon after ingestion. There is no specific antidote to Rohypnol.

When taken with centrally acting drugs, especially alcohol, the effects of overdosage are likely to be more severe and, in the absence of supportive measures, may prove fatal.

Pharmaceutical precautions *Storage:* Rohypnol tablets should be stored in a dry place.

Legal category POM.

Package quantities Rohypnol tablets 1 mg are blister-packed in packings of 100.

Further information The distribution half-life of flunitrazepam is about three hours; the elimination half-life is, on average, 22 hours.

The onset of effect is rapid and the duration of effect is dose-dependent.

Treatment should be kept to a minimum and given only under close medical supervision. Little is known regarding the efficacy or safety of benzodiazepines in long-term use.

Product licence number 0031/0104.

ROSCORBIC*

Presentation Round, white tablets with $\frac{C}{25}$ imprinted on one face, containing 25 mg ascorbic acid.

Round, white tablets with $\frac{C}{50}$ imprinted on one face, containing 50 mg ascorbic acid.

Round, white tablets with $\frac{C}{200}$ imprinted on one face, containing 200 mg ascorbic acid.

Round, white tablets with $\frac{C}{500}$ imprinted on one face, containing 500 mg ascorbic acid.

Round, white, effervescent tablets, diameter 25 mm with no superficial markings, containing 1 g ascorbic acid.

Uses *Properties:* Roscorbic is a synthetic vitamin C preparation. The most clearly established function of vitamin C in the body is the control of the formation of colloidal intercellular substances.

Deficiency of vitamin C leads to scurvy. In the absence of the vitamin a typical nutritional anaemia develops; the vitamin acts directly on the blood-forming centres and is essential for the maturation of the red blood cells.

Indications: Vitamin C is specific in the treatment of scurvy.

It has been proved useful as an adjunct to the treatment of: wounds and fractures; corneal ulcers; infectious rheumatic conditions; anaemia.

Dosage and administration

Adults:

Scurvy	0.5 to 1 g two or three times daily
Infections, rheumatic conditions, wound healing, fractures	1 g two or three times daily after meals
All other indications	200 to 500 mg daily

Children:

Over 12 years	three-quarters adult dose
4 to 12 years	half adult dose
Under 4 years	one-quarter adult dose

Roscorbic effervescent 1 g tablets are particularly suitable for the administration of large doses. They should be dissolved in a tumbler of water immediately before use.

Roscorbic tablets are for oral administration.

Contra-indications, warnings, etc Nil.

Pharmaceutical precautions *Storage:* The recommended maximum storage temperature for Roscorbic 25 mg, 50 mg, 200 mg and 500 mg is 25°C; the tablets should be protected from moisture and light. The recommended maximum storage temperature for Roscorbic effervescent 1 g tablets is 30°C; the effervescent tablets should be protected from moisture.

Legal category P.

MINOVLAR* 21 MINOVLAR* 21 MINOVLAR* MINOVLAR* ED

Representation *Anovlar 21*: Each green, sugar-coated tablet bears a printed white A in a white regular hexagon on both sides, and contains 4 mg norethisterone acetate and 0.05 mg ethinyloestradiol.

Minovlar 21: Each pink, sugar-coated tablet contains 4 mg norethisterone acetate and 0.05 mg ethinyloestradiol.

Minovlar: Each ochre, sugar-coated tablet bears a printed black A in a black regular hexagon on both sides, and contains 1 mg norethisterone acetate and 0.05 mg ethinyloestradiol.

Minovlar ED: 21 Minovlar tablets plus 7 inactive bridging tablets.

Uses Oral contraception and the recognised gynaecological indications for such oestrogen-progestogen combinations. The mode of action includes the inhibition of ovulation by suppression of the mid-cycle surge of oestrogen hormone, the inspissation of cervical mucus so as to constitute a barrier to sperm, and the rendering of the endometrium unreceptive to implantation.

Dosage and administration *Anovlar 21*, *Gynovlar 21* and *Minovlar*.

First treatment cycle: 1 tablet daily for 21 days, starting on the fifth day of the menstrual cycle (the first day of menstruation counting as day 1). In the first cycle only, an additional form of contraception (except the rhythm, temperature or cervical-mucus methods) must be used for the first 14 days of tablet-taking.

Subsequent cycles: Each subsequent course is started after seven tablet-free days have followed the preceding course.

Minovlar ED: **First treatment cycle**: 1 tablet daily for 28 days, starting in the red sector on the first day of bleeding, the starting tablet being the one marked with the appropriate day of the week.

Subsequent cycles: Each subsequent course is started on the red sector on the day after the previous one has been finished. Pack, therefore, follows pack without interval. In the first cycle only, an additional form of contraception (except the rhythm, temperature or cervical-mucus methods) must be used for the first 14 days of tablet-taking.

Changing from high-dosed to low-dosed preparations: Additional (non-hormonal) precautions, other than the rhythm, temperature or cervical-mucus methods, should also be used for the first 14 days when changing product.

Post-partum and post-abortion use: After pregnancy oral contraception is usually started as soon as spontaneous menstruation has been resumed. However, oral

contraception can be started within 7–12 days of a vaginal delivery, provided that the patient is fully ambulant and there are no puerperal complications. Starting within 12 days of delivery obviates additional contraceptive precautions. After a first-trimester abortion, oral contraception may be started immediately.

Special circumstances requiring additional contraception: Incorrect administration: If a tablet is delayed, it should be taken as soon as possible, and if it is taken within 12 hours of the correct time additional contraception is not needed. Further tablets should then be taken at the usual time. However, if the delay exceeds 12 hours, ovulation may occur. In those circumstances, any tablet or tablets delayed more than 12 hours should be omitted, the remaining tablets should be taken on the correct days at the usual time, and extra precautions (except the rhythm, temperature and cervical-mucus methods) should be used until the next withdrawal bleed.

Gastro-intestinal upset: Vomiting or diarrhoea may reduce the effectiveness of the tablets by preventing them from being fully absorbed. Therefore, it is advisable that an additional method of contraception be used throughout the remainder of the course concerned. Mild laxatives do not impair contraceptive action.

Interaction with other drugs: Some drugs accelerate the metabolism of oral contraceptives taken concurrently. Drugs suspected of having the capacity to reduce the efficacy of oral contraceptives include barbiturates, phenylbutazone, phenytoin, rifampicin, ampicillin and other antibiotics. It is, therefore, advisable to use non-hormonal methods of contraception (except the rhythm, temperature or cervical-mucus methods) in addition to the oral contraceptive as long as an extremely high degree of protection must be provided during treatment with such drugs.

Contra-indications, warnings, etc

Contra-indications: Pregnancy. Thrombotic disorders and a history of these conditions, sickle-cell anaemia, disorders of lipid metabolism and other conditions in which, in individual cases, there is known or suspected to be a much increased risk of thrombosis. Acute or severe chronic liver diseases. Dubin-Johnson syndrome. Rotor syndrome. History, during pregnancy, of idiopathic jaundice or severe pruritus. History of herpes gestationis. Mammary or endometrial carcinoma, or a history of these conditions. Abnormal vaginal bleeding of unknown cause. Deterioration of otosclerosis during pregnancy.

Warnings: There is a general opinion, based on statistical evidence, that users of combined oral contraceptives experience, more often than non-users, venous thromboembolism, arterial thrombosis, including cerebral and myocardial infarction, and subarachnoid haemorrhage. Full recovery from such disorders does not always occur, and it should be realised that in a few cases they are fatal. How often these disorders occur in users of the modern low-dose pills is not known, but there are

reasons for suggesting that they may occur less often than with older pills.

Certain factors may entail some risk of thrombosis, e.g. smoking, obesity, varicose veins, cardiovascular diseases, diabetes and migraine. The suitability of a combined oral contraceptive should be judged according to the severity of such conditions in the individual case, and should be discussed with the patient before she decides to take it. The risk of arterial thrombosis associated with oral contraceptives increases with age, and this risk is aggravated by cigarette-smoking. The use of combined oral contraceptives by women in the older age-group, especially those who are cigarette-smokers should therefore be discouraged, and alternative methods advised.

The possibility cannot be ruled out that certain chronic diseases may occasionally deteriorate during the use of combined oral contraceptives (see 'Precautions'). Hepatic tumours have been reported very rarely in women taking combined oral contraceptives, generally for a protracted period of time. A hepatic tumour should be considered in the differential diagnosis when upper abdominal pain, enlarged liver or signs of intra-abdominal haemorrhage occur.

Reasons for stopping oral contraception immediately: Occurrence of migraine in patients who have never previously suffered from it. Exacerbation of pre-existing migraine. Any unusually frequent or unusually severe headaches. Any kind of acute disturbance of vision. Suspicion of thrombosis or infarction. Six weeks before elective operations and during immobilisation, e.g. after accidents, etc. Significant rise in blood-pressure. Jaundice. Clear exacerbation of conditions known to be capable of deteriorating during oral contraception or pregnancy. Pregnancy is a reason for stopping immediately because it has been suggested by some investigations that oral contraceptives taken in early pregnancy may slightly increase the risk of foetal malformations. Other investigations have failed to support these findings. The possibility therefore cannot be excluded, but it is certain that if a risk exists at all, it is very small.

Precautions: Examination of the pelvic organs, breasts and blood-pressure should precede the prescribing of any combined oral contraceptive, and should be repeated regularly. Before starting treatment, pregnancy must be excluded.

The following conditions required careful consideration: a history of severe depressive states, varicose veins, diabetes, hypertension, epilepsy, otosclerosis, multiple sclerosis, porphyria, tetany, disturbed liver function, gallstones, cardiovascular diseases, renal diseases, chloasma, uterine fibroids, asthma, the wearing of contact lenses, or any disease that is prone to worsen during pregnancy. The first appearance or deterioration of any of these conditions may indicate that the oral contraceptive should be stopped.

The risk of the deterioration of chloasma, which is often not fully reversible, is reduced by the avoidance of excessive exposure to sunlight.

Side-effects: Occasional side-effects may include nausea, vomiting, headaches, breast tension, changed body weight or libido, depressive moods and chloasma.

Menstrual changes:

1. **Reduction of menstrual flow:** This is not abnormal and it is to be expected in some patients. Indeed, it may be beneficial where heavy periods were previously experienced.

2. **Missed menstruation:** Occasionally, withdrawal bleeding may not occur at all. If the tablets have been taken correctly, pregnancy is very unlikely, but should be ruled out before a new course of tablets is started.

Intermenstrual bleeding: Very light 'spotting' or heavy 'breakthrough bleeding' may occur during tablet-taking, especially in the first few cycles. It appears to be generally of no significance, except where it indicates errors of tablet-taking, or where the possibility of interaction with other drugs exists (q.v.). However, if irregular bleeding is persistent, an organic cause should be considered.

Effect on adrenal and thyroid glands: Oral contraceptives have no significant influence on adrenocortical function. The ACTH function test for the adrenal cortex remains unchanged. The reduction in corticosteroid excretion and the elevation of plasma corticosteroids are due to a increased cortisol-binding capacity of the plasma proteins.

The response to metyrapone is less pronounced than in untreated women and is thus similar to that during pregnancy.

The radio-iodine uptake shows that thyroid function is unchanged. There is a rise in serum protein-bound iodine, similar to that in pregnancy and during the administration of oestrogens. This is due to the increased capacity of the plasma proteins for binding thyroid hormones, rather than to any change in glandular function. In women taking oral contraceptives, the content of protein-bound iodine in blood serum should therefore, not be used for evaluation of thyroid function.

Effect on blood chemistry: Oral contraceptives may accelerate erythrocyte sedimentation in the absence of any disease. This effect is due to a change in the proportion of the plasma protein fractions. Increases in plasma copper, iron and alkaline phosphatase have also been recorded.

Overdosage: There have been no reports of serious ill effects from overdosage, even when a considerable number of tablets have been taken by a small child. In general, it is, therefore, unnecessary to treat overdosage. However, if overdosage is discovered within two or three hours and is so large that treatment seems desirable, gastric lavage can be safely used.

There are no specific antidotes and further treatment should be symptomatic.

Pharmaceutical precautions Store in cool, dry conditions: shelf-life five years.

Legal category POM.

Package quantities All Schering combined oral contraceptives are available in packs containing on months' supply.

Further information Nil.

BILIGRAM®

Presentation *Biligram* is a 35% w/v aqueous solution of ioglycamide (meglumine ioglycamate), with an iodine content of 176 mg/ml.

Biligram for infusion is a 17% aqueous solution of

glycamide (meglumine ioglycamate), with an iodine content of 85 mg/ml.

uses Cholegraphy, infusion cholegraphy.

Intravenous cholegraphy should be performed as the first examination only when there is strong evidence of disease involving the biliary tract. In all other cases for diagnosis—especially in obscure upper abdominal complaints—oral cholegraphy (Biloptin, Solu-Biloptin) is to be preferred.

usage and administration The infusion should always be started at a low rate and then increased to the usual higher rate after three to five minutes. This technique induces heterotopic excretion and improves the clearance.

dosage

Adults: *Injection* 30 ml Biligram ensures optimum contrast for normal to overweight adults. Injection time not less than 5 minutes.

Infusion: One 100 ml bottle. Infusion time not less than 30 min.

Children aged 12 years and over:

Injection: 0.4 ml/kg body weight. Injection time not less than 10 minutes.

Infusion: 0.8–1.0 ml/kg body weight. Infusion time one or two every two seconds.

Children aged under 12 years:

Injection: (2 months–1 yr) 0.8 ml/kg body weight. (1–5 yrs) 0.6 ml/kg body weight. (6–11 yrs) 0.45 ml/kg body weight. Injection time: not less than 10 minutes.

contra-indications, warnings, etc

contra-indications: Severe cardiovascular insufficiency, particularly right ventricular failure. Proven or suspected hypersensitivity to iodine-containing contrast media. Manifest thyrotoxicosis. Severe functional disturbance of the liver or kidneys. Monoclonal IgM gammopathy (e.g. macroglobulinaemia (Waldenström's disease)).

warnings/side-effects: In patients with multiple myeloma, other severe diseases, poor general health or thyroid hyperfunction, the need for examination merits particularly careful consideration. This applies to patients with a history of allergy (e.g. bronchial asthma, endogenous eczema), since experience has shown that they may exhibit hypersensitivity to drugs. Pre-testing does not give a reliable warning of allergic reactions to iodine-containing contrast media. Some radiologists give an antihistamine or a corticoid prophylactically to patients with a history of allergy. Because of the possibility of precipitation, contrast medium and prophylactic agents must not be administered mixed together.

Since radiation should, if possible, be avoided during pregnancy, and moreover it has not yet been demonstrated whether it is safe to use Biligram in pregnant patients, Biligram should be administered during pregnancy only if the doctor regards the examination as essential.

Thyroid hyperfunction can increase for some time after administration of biliary contrast media.

If iodine isotopes are to be administered for diagnosing thyroid disease, it should be borne in mind that the capacity of the thyroid tissue to take up iodine will be reduced for eight to ten weeks or more by iodinated biliary contrast media.

Some investigators have reported temporary and reversible changes in liver-function tests after Biligram. These changes are not thought to reflect liver damage.

The opinion has been expressed that intravenous

cholegraphy should not be performed immediately after negative oral cholegraphy. A large number of radiologists do not share this view – provided that the patient is adequately hydrated and renal function is not impaired.

The patient should be recumbent during the administration of Biligram. Thereafter, the patient must be kept under close observation for at least 15 minutes, since about 90% of all severe incidents occur within that time, and must not be left unsupervised until the end of the examination. If the administration does not take place on the X-ray table, any patient with a labile circulation should be brought to the X-ray machine sitting or lying down. Inadvertent paravenous administration of Biligram can cause pain, but experience has shown that it is very rarely followed by serious tissue reactions. A local anaesthetic helps to relieve the pain. With more extensive paravenous infiltration, it is recommended that a hyaluronidase preparation be injected into the affected area to hasten absorption.

The greater the rate of administration of Biligram, the higher the incidence of common side-effects, such as an unpleasant taste, nausea, vomiting or a sensation of heat. These side-effects are rare if the recommended rate of administration is adhered to. Too rapid an administration may put the patient's life at risk – particularly if he has cardiovascular damage, whether manifest or not, or if his general condition is poor. Each bottle of Biligram for infusion should be used for one investigation only, and any remaining medium should be discarded.

Particular caution should be exercised in allergic patients who have previously tolerated injectable iodine-containing contrast media without any complication, since they may have become sensitised to these substances. As with any contrast medium, the possibility of hypersensitivity must always be considered. If marked side-effects or suspected allergic reactions occur during infusion or injection and persist or even worsen when the administration is interrupted, it is probable that the patient has such a hypersensitivity. Therefore, the investigation must be abandoned. The needle or cannula should be left in the vein for some time in order to maintain access for intravenous therapy. Even relatively minor symptoms, such as itching of the skin, sneezing, violent yawns, tickling in the throat, hoarseness or attacks or coughing may be early signs of a severe reaction and, therefore, merit careful attention.

Very rarely, severe or even life-threatening incidents, such as severe hypotension and collapse, circulatory failure, ventricular fibrillation, cardiac arrest, pulmonary oedema, anaphylactic shock or other allergic manifestations, convulsions or other cerebral symptoms may occur.

At present there is no clinical test that is suitable for predicting an incident. It must be emphasised that every use of a contrast medium therefore entails a certain risk and requires appropriate precautions. Ready availability of all drugs and equipment for emergency treatment and familiarity with the various procedures are prerequisites for the effective management of contrast-medium incidents.

Some guidance in the treatment of such incidents is contained in the leaflet supplied with the pack.

Pharmaceutical precautions Storage: Protect from light and heat. Shelf-life five years.

ILOPTIN* AND SOLU-BILOPTIN*

Presentation *Biloptin*: Capsules of sodium iopodate. *Biloptin* capsules, containing a total 1.84 g iodine in g of sodium iopodate.

Solu-Biloptin: Sachets, each containing 1.85 g iodine in g of calcium iopodate.

Uses Oral contrast media for cholecystography andolangiography.

Dosage and administration See table below.

Routine cholecystography

<i>Solu-Biloptin</i>	<i>Biloptin</i>
Other media should be taken after the last meal on the evening before the examination.	
Adults	
The contents of 1 sachet.	6 capsules
Children:	
Under 4 yrs or under 20 kg	<i>Solu-Biloptin</i> is
body weight 0.30 g of	recommended.
powder/kg body	
weight.	
Over 4 yrs or over 20 kg	
body weight 0.15 g of	
powder/kg body	
weight.	
 neonates and infants:	
Ilgam is recommended but a trial by the oral route, may be undertaken using 0.45 g of <i>Solu-Biloptin</i> powder/kg body weight.	
The results are improved if an enema is given on the evening preceding and another immediately before the examination.	

Other examination techniques in adults only

<i>iloptin</i>	<i>Solu-Biloptin</i>
rapid cholecystography	
capsules or double dose of 12 capsules.	The contents of 1 sachet or double dose of 2 sachets.
olangiography	
2 capsules	The contents of 2 sachets.
ractionated oral cholecystography	
capsules 10–12 hrs before the examination and another 6 capsules 3 hrs before the examination.	The contents of 1 sachet 10–12 hrs before the examination and another 1 sachet 3 hrs before the examination.

Contra-indications, warnings, etc

Contra-indications: Proven or suspected hypersensitivity to iodine-containing contrast media. Thyrotoxicosis. Severe impairment of hepatic or renal function.

Warnings/side-effects: *Biloptin* and *Solu-Biloptin* are well tolerated and side-effects, even of a trivial nature, are extraordinarily rare. Sensitive patients may occasionally complain of mild sensations of pressure in the stomach or nausea. Attacks of diarrhoea and vomiting are exceptional. Very few cases of urticaria have been observed.

If iodine isotopes are to be administered for diagnosing thyroid disease, it should be borne in mind that the capacity of the thyroid tissue to take up iodine will be reduced for 8–10 weeks or more by iodinated biliary X-ray contrast media.

Apart from the fact that X-ray examinations should if possible, be avoided during pregnancy, it must be pointed out that it has not yet been proved beyond question that *Biloptin* may be used without hesitation in pregnant patients. Therefore, such an examination with a contrast medium during pregnancy should be carried out only if considered absolutely necessary by the physician.

Pharmaceutical precautions **Storage:** cool, dry conditions. Shelf-life five years.

Legal category P.

CONTROVLAR*

Presentation Each pink, sugar-coated tablet contains 3 mg norethisterone acetate and 0.05 mg ethinyl-oestradiol.

Uses *Controvlar* inhibits ovulation, which is of value in the treatment of dysmenorrhoea, since anovulatory cycles are almost always painless. Mittelschmerz is also prevented by the suppression of ovulation. *Controvlar* prevents the oestrogenic overstimulation that is responsible for menorrhagia, metropathia haemorrhagica and the symptoms of endometriosis. It imposes a regular cycle of bleeding and is, therefore, suitable for the treatment of menstrual irregularities, i.e. polymenorrhoea and oligomenorrhoea.

Dosage and administration **First treatment cycle:** One tablet daily for 21 days, starting on the fifth day of the menstrual cycle (the first day of menstruation counting as day 1).

Subsequent cycles: Each subsequent course is started after seven tablet-free days have followed the preceding course, irrespective of the menstrual pattern, with the proviso that, if no bleeding occurs at all, pregnancy should be excluded before treatment is resumed.

Contra-indications, warnings, etc

Contra-indications: Pregnancy. Thrombotic disorders and a history of these conditions, sickle-cell anaemia, disorders of lipid metabolism and other conditions in which, in individual cases, there is known or suspected

to be a much increased risk of thrombosis. Acute or severe chronic liver disease. Dubin-Johnson syndrome. Rotor syndrome. History, during pregnancy of idiopathic jaundice or severe pruritus. History of herpes gestationis. Mammary or endometrial carcinoma, or a history of these conditions. Deterioration of otosclerosis during pregnancy.

Warnings: There is a general opinion, based on statistical evidence, that users of this type of oestrogen-progestogen combination experience, more often than non-users, venous thromboembolism, arterial thrombosis, including cerebral and myocardial infarction, and subarachnoid haemorrhage. Full recovery from such disorders does not always occur, and it should be realised that in a few cases they are fatal.

Certain conditions may entail some risk of thrombosis, e.g. smoking, obesity, varicose veins, cardiovascular diseases, diabetes and migraine. The advisability of prescribing Controvar should be judged according to the severity of such conditions in the individual case and should be discussed with the patient.

The possibility cannot be ruled out that certain chronic diseases may occasionally deteriorate during the use of Controvar (see 'Precautions').

Hepatic tumours have been reported very rarely in women taking oestrogen-progestogen combinations of this type, generally for a protracted period of time. A hepatic tumour should be considered in the differential diagnosis when upper abdominal pain, enlarged liver or signs of intra-abdominal haemorrhage occur.

Reasons for stopping Controvar immediately: Occurrence of migraine in patients who have never previously suffered from it. Exacerbation of pre-existing migraine. Any unusually frequent or unusually severe headaches. Any kind of acute disturbance of vision. Suspicion of thrombosis or infarction. Six weeks before elective operations and during immobilisation, e.g. after accidents, etc. Significant rise in blood pressure. Jaundice. Clear exacerbation of conditions known to be capable of deteriorating during oral contraception or pregnancy. Pregnancy is a reason for stopping Controvar immediately because it has been suggested by some investigations that oestrogen-progestogen combinations taken in early pregnancy may slightly increase the risk of foetal malformations. Other investigations have failed to support these findings. The possibility therefore cannot be excluded, but it is certain that, if a risk exists at all, it is very small.

Precautions: Examination of the pelvic organs, breasts and blood-pressure should precede the prescribing of Controvar, and should be repeated regularly. Before starting treatment, pregnancy must be excluded.

The following conditions require careful consideration: a history of severe depressive states, varicose veins, diabetes, hypertension, epilepsy, otosclerosis, multiple sclerosis, porphyria, tetany, disturbed liver function, gallstones, cardiovascular diseases, renal diseases, chloasma, uterine fibroids, asthma, the wearing of contact lenses, or any disease that is prone to worsen during pregnancy. The first appearance or deterioration of any of these conditions may indicate that Controvar should be stopped. The risk of the deterioration of chloasma, which is often not fully reversible, is reduced by the avoidance of excessive exposure to sunlight.

Side-effects: Occasional side-effects may include: nausea, vomiting, headaches, breast tension, changed body weight or libido, depressive moods and chloasma.

Effect on adrenal and thyroid glands: Controvar has no significant influence on adrenocortical function. The ACTH function test for the adrenal cortex remain unchanged. The reduction in corticosteroid excretion and the elevation of plasma corticosteroids are due to an increased cortisol-binding capacity of the plasma proteins.

The response to metyrapone is less pronounced than in untreated women and is thus similar to that during pregnancy.

The radio-iodine uptake shows that thyroid function is unchanged. There is a rise in serum protein-bound iodine, similar to that in pregnancy and during the administration of oestrogens. This is due to the increased capacity of the plasma proteins for binding thyroid hormones, rather than to any change in glandular function. In women taking Controvar, the content of protein-bound iodine in blood serum should, therefore not be used for the evaluation of thyroid function.

Effect on blood chemistry: Controvar may accelerate erythrocyte sedimentation in the absence of any disease. This effect is due to a change in the proportion of the plasma protein fractions. Increases in plasma copper and alkaline phosphatase have also been recorded.

Overdosage: There have been no reports of serious ill effects from overdosage, even when a considerable number of tablets have been taken by a small child. In general, it is, therefore, unnecessary to treat overdosage. However, if overdosage is discovered within two or three hours and is so large that treatment seems desirable, gastric lavage can be safely used. There are no specific antidotes and further treatment should be symptomatic.

CYCLO-PROGYNOVA* 1 mg CYCLO-PROGYNOVA* 2 mg

Presentation *Cyclo-Progynova 1 mg:* The circular memo-pack holds 11 beige tablets, each containing 1 mg oestradiol valerate, and 10 light-brown tablets each containing 1 mg oestradiol valerate and 0.25 mg levonorgestrel. All tablets have a lustrous, sugar coating and bear a black B in a black regular hexagon printed on both sides.

Cyclo-Progynova 2 mg: The circular memo-pack holds 11 white tablets, each containing 2 mg oestradiol valerate, and 10 pale brown tablets, each containing 2 mg oestradiol valerate and 0.5 mg norgestrel. All tablets have a lustrous, sugar coating and bear a red B in a red regular hexagon printed on both sides.

Uses The treatment of the climacteric syndrome. The prophylaxis and treatment of the postmenopausal sequelae of oestrogen withdrawal, e.g. osteoporosis and senile vaginitis.

Cyclo-Progynova 1 mg and Cyclo-Progynova 2 mg are designed to provide hormone replacement therapy during and after the climacteric. The addition of progestogen in the second half of each course helps provide good control of the irregular cycles that a

characteristic of the premenopausal phase and opposes the production of endometrial hyperplasia. Whilst natural hormone production is little affected, Cyclo-Progynova 1 mg and Cyclo-Progynova 2 mg abolish or improve the characteristic symptoms of the climacteric such as hot flashes, sweating attacks and sleep disorders. Cyclo-Progynova 1 mg and Cyclo-Progynova 2 mg do not consistently inhibit ovulation and are therefore suitable for contraception.

Dosage and administration If the patient is still menstruating freely, treatment should begin on the 5th day of menstruation. Patients whose periods are very frequent or who are postmenopausal may start at any time, provided pregnancy has been excluded (see precautions and special information). Initial treatment should be with Cyclo-Progynova 1 mg. One beige tablet is taken daily for 11 days, followed by one light-brown tablet daily for 10 days. An interval of seven days follows, during which bleeding will normally occur. Cyclo-Progynova 2 mg should be substituted if the control of climacteric symptoms or dysfunctional bleeding is not fully achieved at the lower dosage. One white tablet is taken daily for 11 days, followed by one pale brown tablet for 10 days. An interval of seven days again follows, during which bleeding is to be expected.

When symptoms have been controlled, Cyclo-Progynova 1 mg will usually suffice for maintenance, but it could be borne in mind that the appropriate dosage will be determined by the rate of metabolism of Cyclo-Progynova, rather than by the initial severity of the symptoms.

Contra-indications, warnings, etc

Contra-indications: Pregnancy, (see Precautions and special information) severe disturbances of liver function, jaundice or general pruritus during a previous pregnancy, rubin-Johnson syndrome, Rotor syndrome, existing or previous thromboembolic processes, sickle-cell anaemia, suspected or existing hormone-dependent disorders, tumours of the uterus and breast, congenital disturbances of lipid metabolism, a history of herpes gestationis, sclerosis with deterioration in previous pregnancies.

Warnings/side-effects: Hormonal contraception should be stopped when Cyclo-Progynova is started and the patient should be advised to take non-hormonal contraceptive precautions. The following symptoms have been reported during treatment: anxiety, increased appetite, bloating, breast symptoms, cardiac symptoms, depression, dizziness, dyspepsia, leg pains and swelling, altered libido, nausea, rashes, vomiting and altered weight.

Some women are predisposed to cholestasis during steroid therapy.

Diseases that are known to be subject to deterioration during pregnancy (e.g. multiple sclerosis, epilepsy, diabetes, hypertension, porphyria, tetany and osteoporosis) should be carefully observed during treatment.

Precautions and special information: Before starting treatment, pregnancy must be excluded. If withdrawal bleeding fails to occur at about 28-day intervals, treatment should be stopped until pregnancy has been ruled out.

Treatment should be stopped at once if migrainous or frequent and unusually severe headaches occur for the first time, or if there are other symptoms that are possible prodromata of vascular occlusion.

Treatment should also be stopped if trauma, illness or

impending surgery is considered to entail a risk of thrombosis.

Treatment should be stopped at once if jaundice or pregnancy occurs, or if there is a significant rise in blood-pressure.

In patients with mild chronic liver disease, liver function should be checked every 8–12 weeks.

Examination of the pelvic organs, endometrium, breasts and blood-pressure is advised before and periodically during treatment with Cyclo-Progynova.

Irregular bleeding during tablet-taking should be investigated.

Prolonged exposure to unopposed oestrogens may increase the risk of development of endometrial carcinoma. The general consensus of opinion is that the addition of 10 days progestogen towards the end of the cycle, as in Cyclo-Progynova, diminishes the possibility of such a risk, and some investigators consider that it might be protective.

Overdosage: There have been no reports of ill-effects from overdosage which it is, therefore, generally unnecessary to treat. If overdosage is discovered within two or three hours and is so large that treatment seems desirable, gastric lavage can safely be used. There are no specific antidotes, and further treatment should be symptomatic.

Pharmaceutical precautions Store in cool, dry conditions. Shelf-life five years.

Legal category POM.

Package quantities Each outer carton contains a memo-pack containing 21 tablets.

Further information Nil.

Cyclo-Progynova 1 mg 0053/0108

Cyclo-Progynova 2 mg 0053/0053

CYPROSTAT* ▼

Presentation Each round white, 9 mm tablet is embossed on one side with 'BV' in a regular hexagon, and is scored on the other. It contains 50 mg cyproterone acetate (6-chloro-17 α -hydroxy-1 α , 2 α -methylene-pregna-4, 6-diene-3, 20-dione acetate).

Uses Palliative treatment of prostatic carcinoma. Prostatic carcinoma and its metastases are in general androgen-dependent. Cyprostat exerts a direct antiandrogenic action on the tumour and its metastases, and in addition it exerts a negative feedback effect on the hypothalamic receptors, so leading to a reduction in gonadotrophin release, and hence to diminished production of testicular androgens. Cyprostat may be used alone or in conjunction with surgery.

Dosage and administration The usual daily dose is 300 mg (6 tablets) orally, divided into 2–3 doses and taken after meals. Cyprostat therapy should not be discontinued when remission or improvement occurs. The dose may be reduced if side-effects are troublesome, but should be kept within the range of 200–300 mg daily.

Contra-indications, warnings, etc

Contra-indications: None.

Warnings, Side-effects: **Liver:** Cyproterone acetate has been found to cause liver abnormalities in animals, including the development of tumours. Cyprostat treat-

ment has shown good liver tolerance in man. Nevertheless, liver-function tests should be performed regularly during treatment.

Inhibition of spermatogenesis: The sperm count and the volume of ejaculate are reduced. Infertility is usual, and there may be azoospermia after 8 weeks. There is usually slight atrophy of seminiferous tubules. Follow-up examinations have shown these changes to be reversible, spermatogenesis usually reverting to its previous state about 3–5 months after stopping Cyprostat, or in some users, up to 20 months. That spermatogenesis can recover even after very long treatment is not yet known. There is evidence that abnormal sperms which might give rise to malformed embryos are produced during treatment with Cyprostat.

Thromboembolism: Patients with a history of thrombosis may be at risk of recurrence of the disease during Cyprostat therapy.

Chronic depression: It has been found that some patients with severe chronic depression deteriorate whilst taking Cyprostat therapy.

Tiredness: Fatigue and lassitude are common in the first few weeks of therapy but usually become much less from the third month. The marked lassitude and asthenia necessitate especial care when driving or operating machinery.

Gynaecomastia: Transient, and perhaps in some cases permanent, enlargement of the mammary glands has been reported. In rare cases, galactorrhoea and tender benign nodules have been reported. Symptoms generally subside after discontinuation of treatment or on reduction of dosage, but this should be weighed against the risk to the tumour of using inadequate doses.

Body weight: During long-term treatment, changes in body weight have been reported. Both increases and decreases have been seen.

Other changes that have been reported include reduction of sebum production leading to dryness of the skin, and transient patchy loss of body hair.

Adrenocortical function: During treatment adrenocortical function should be supervised, since suppression has been observed.

Diabetes: Cyprostat can influence carbohydrate metabolism. Parameters of carbohydrate metabolism should be examined carefully in all diabetics before and regularly during treatment.

Chronic alcohol: Chronic alcohol appears to reduce the effect of cyproterone acetate in male hypersexuality, but the relevance of this to the treatment of prostatic carcinoma is not known.

Haemoglobin: Hypochromic anaemia has been found rarely during long-term treatment, and blood-counts before and at regular intervals during treatment are advisable.

Nitrogen balance: A negative balance is usual at the start of treatment, but does not persist.

Overdosage: There have been no reports of ill-effects of overdosage, which it is, therefore, generally unnecessary to treat. If overdosage is discovered within two or three hours and is so large that treatment seems desirable, gastric lavage can safely be used. There are no specific antidotes, and further treatment should be symptomatic.

Pharmaceutical precautions Store in cool, dry conditions away from strong sunlight. **Shelf-life:** five years.

Package quantities: Containers of 200 tablets.

Legal category: POM.

Further information: Nil.

DEPOSTAT*

Presentation Gestronol hexanoate in oily solution for intramuscular administration. Ampoules contain 200 mg in 2 ml.

Uses Endometrial carcinoma. Benign prostatic hyperplasia. Depostat is a depot progestogen, in a concentrated injectable non-aqueous solution, and is 25 times more potent than its parent substance progesterone. In the female, the action of Depostat is concentrated on the endometrium. This action is direct and does not involve suppression via the pituitary. Except in some high anaplastic tumours, Depostat has a strong antimitotic effect, with regression or arrest of primary endometrial carcinoma and of soft-tissue metastases.

In the male, Depostat has been shown to reduce prostatic weight significantly. It may effect an objective improvement in peak urine flow rates and residual urine and in subjective symptoms such as nocturia.

Dosage and administration Endometrial carcinoma: before hysterectomy and for advanced disease. A well tolerated adjunct to other therapy. To inhibit metastatic spread before and after operation, 200–400 mg intramuscularly every 5–7 days, starting immediately following diagnosis and continuing for a minimum of 12 weeks.

For treating existing metastases: 200–400 mg intramuscularly every 5–7 days. If the metastases are hormone-responsive, improvement will be observed within 8–12 weeks of therapy. Treatment should then be continued as long as it appears beneficial.

Benign prostatic hyperplasia where a) the patient is at operation risk; b) symptoms are mild; c) there is a waiting list for operation: standard dosage is 200 mg weekly by intramuscular injection, but in view of Depostat's good tolerance, this dosage can confidently be increased. In trials, 300 mg and 400 mg weekly have been used. The full benefit of treatment is unlikely to be established in a shorter period than three months, and trial results suggest that improvement can continue during substantially longer periods.

Contra-indications, warnings, etc

Contra-indications: Pregnancy. History of herpes gestationis.

Warning/side-effects: Rarely, local reactions may occur at the site of injection. Exacerbation of bronchial asthma, epilepsy and migraine may sometimes occur.

Side-effects are infrequent. In males, a reversible depression of libido and mammary discomfort have been reported by a few patients. Spermatogenesis is temporarily inhibited. In rare cases coughing, dyspnoea and circulatory irregularities may develop during or immediately after the injection.

Tolerance: In patients with chronic liver damage it is advisable to check liver function at intervals during long term treatment or repeated courses of Depostat. Transient moderate rises in bromsulphthalein retention and serum transaminases have occasionally been observed but have always proved harmless.

Pharmaceutical precautions Store in cool dry conditions away from strong sunlight: shelf-life five years.

Legal category POM.

Package quantities 5 ampoules of 2 ml.

Further information Nil.

Product licence number 0053/0018.

UGYNON* 30 UGYNON* 50 MICROGYNON* 30

Presentation *Eugynon 30*: Each white, sugar-coated tablet bears a printed black C in a regular hexagon on both sides and contains 0.25 mg levonorgestrel (formerly known as D-norgestrel) and 0.03 mg ethinylestradiol.

Ugynon 50: Each white, sugar-coated tablet contains 0.25 mg levonorgestrel (formerly known as D-norgestrel) in 0.5 mg norgestrel, and 0.05 mg ethinylestradiol.

Microgynon 30: Each beige, sugar-coated tablet bears a black A in a black hexagon printed on both sides and contains 0.15 mg levonorgestrel (formerly known as D-norgestrel) and 0.03 mg ethinylestradiol.

Uses Oral contraception and the recognised gynaecological indications for such oestrogen-progestogen combinations. The mode of action includes the inhibition of ovulation by suppression of the mid-cycle surge of uterine hormone, the inspissation of cervical mucus so as to constitute a barrier to sperm, and the rendering of the endometrium unresponsive to implantation.

Dosage and administration *First treatment cycle*: 1 tablet daily for 21 days, starting on the fifth day of the menstrual cycle (the first day of menstruation counting as day 1). In the first cycle only, an additional form of contraception (except the rhythm, temperature or cervical-mucus methods) must be used for the first 14 days of tablet-taking.

Subsequent cycles: Each subsequent course is started after seven tablet-free days have followed the preceding course.

Changing from high-dosed to low-dosed preparations: Additional (non-hormonal) precautions, other than the rhythm, temperature or cervical-mucus methods, should also be used for the first 14 days when changing products.

Post-partum and post-abortion use: After pregnancy oral contraception is usually started as soon as spontaneous menstruation has been resumed. However, oral contraception can be started within 7–12 days of a vaginal delivery, provided that the patient is fully ambulant and there are no puerperal complications. Starting within 12 days of delivery obviates additional contraceptive precautions. After a first-trimester abortion, oral contraception may be started immediately.

Special circumstances requiring additional contraception: Incorrect administration: If a tablet is delayed, it should be taken as soon as possible, and if it is taken within 12 hours of the correct time additional contraception is not needed. Further tablets should then be taken at the usual time. However, if the delay exceeds 12 hours, ovulation may occur. In those circumstances, any tablet or tablets delayed more than 12 hours should be

omitted, the remaining tablets should be taken on the correct days at the usual time, and extra precautions (except the rhythm, temperature and cervical-mucus methods) should be used until the next withdrawal bleed.

Gastro-intestinal upset: Vomiting or diarrhoea may reduce the effectiveness of the tablets by preventing them from being fully absorbed. Therefore, it is advisable that an additional method of contraception be used throughout the remainder of the course concerned. Mild laxatives do not impair contraceptive action.

Interaction with other drugs: Some drugs accelerate the metabolism of oral contraceptives taken concurrently. Drugs suspected of having the capacity to reduce the efficacy of oral contraceptives include barbiturates, phenylbutazone, phenytoin, rifampicin, ampicillin and other antibiotics. It is, therefore, advisable to use non-hormonal methods of contraception (except the rhythm, temperature or cervical-mucus methods) in addition to the oral contraceptive as long as an extremely high degree of protection must be provided during treatment with such drugs.

Contra-indications, warnings, etc

Contra-indications: Pregnancy. Thrombotic disorders and a history of these conditions, sickle-cell anaemia, disorders of lipid metabolism and other conditions in which, in individual cases, there is known or suspected to be a much increased risk of thrombosis. Acute or severe chronic liver diseases. Dubin-Johnson syndrome. Rotor syndrome. History, during pregnancy, of idiopathic jaundice or severe pruritus. History of herpes gestationis. Mammary or endometrial carcinoma, or a history of these conditions. Abnormal vaginal bleeding of unknown cause. Deterioration of otosclerosis during pregnancy.

Warnings: There is a general opinion, based on statistical evidence, that users of combined oral contraceptives experience, more often than non-users, venous thromboembolism, arterial thrombosis, including cerebral and myocardial infarction, and subarachnoid haemorrhage. Full recovery from such disorders does not always occur, and it should be realised that in a few cases they are fatal. How often these disorders occur in users of the modern low-dose pills is not known, but there are reasons for suggesting that they may occur less often than with older pills.

Certain factors may entail some risk of thrombosis, e.g. smoking, obesity, varicose veins, cardiovascular diseases, diabetes and migraine. The suitability of a combined oral contraceptive should be judged according to the severity of such conditions in the individual case, and should be discussed with the patient before she decides to take it. The risk of arterial thrombosis associated with oral contraceptives increases with age, and this risk is aggravated by cigarette-smoking. The use of combined oral contraceptives by women in the older age-group, especially those who are cigarette-smokers should therefore be discouraged, and alternative methods advised.

The possibility cannot be ruled out that certain chronic diseases may occasionally deteriorate during the use of combined oral contraceptives (see 'Precautions'). Hepatic tumours have been reported very rarely in women taking combined oral contraceptives, generally for a protracted period of time. A hepatic tumour should be considered in the differential diagnosis when upper abdominal pain, enlarged liver or signs of intra-abdominal haemorrhage occur.

Reasons for stopping oral contraception immediately:

Occurrence of migraine in patients who have never previously suffered from it. Exacerbation of pre-existing migraine. Any unusually frequent or unusually severe headaches. Any kind of acute disturbance of vision. Suspicion of thrombosis or infarction. Six weeks before elective operations and during immobilisation, e.g. after accidents, etc. Significant rise in blood-pressure. Jaundice. Clear exacerbation of conditions known to be capable of deteriorating during oral contraception or pregnancy. Pregnancy is a reason for stopping immediately because it has been suggested by some investigations that oral contraceptives taken in early pregnancy may slightly increase the risk of foetal malformations. Other investigations have failed to support these findings. The possibility therefore cannot be excluded, but it is certain that if a risk exists at all, it is very small.

Precautions: Examination of the pelvic organs, breasts and blood-pressure should precede the prescribing of any combined oral contraceptive, and should be repeated regularly. Before starting treatment, pregnancy must be excluded.

The following conditions required careful consideration: a history of severe depressive states, varicose veins, diabetes, hypertension, epilepsy, otosclerosis, multiple sclerosis, porphyria, tetany, disturbed liver function, gallstones, cardiovascular diseases, renal diseases, chloasma, uterine fibroids, asthma, the wearing of contact lenses, or any disease that is prone to worsen during pregnancy. The first appearance or deterioration of any of these conditions may indicate that the oral contraceptive should be stopped.

The risk of the deterioration of chloasma, which is often not fully reversible, is reduced by the avoidance of excessive exposure to sunlight.

Side-effects: Occasional side-effects may include nausea, vomiting, headaches, breast tension, changed body weight or libido, depressive moods and chloasma.

Menstrual changes:

1. **Reduction of menstrual flow:** This is not abnormal and it is to be expected in some patients. Indeed, it may be beneficial where heavy periods were previously experienced.

2. **Missed menstruation:** Occasionally, withdrawal bleeding may not occur at all. If the tablets have been taken correctly, pregnancy is very unlikely, but should be ruled out before a new course of tablets is started.

Intermenstrual bleeding: Very light 'spotting' or heavier 'breakthrough bleeding' may occur during tablet-taking, especially in the first few cycles. It appears to be generally of no significance, except where it indicates errors of tablet-taking, or where the possibility of interaction with other drugs exists (q.v.). However, if irregular bleeding is persistent, an organic cause should be considered.

Effect on adrenal and thyroid glands: Oral contraceptives have no significant influence on adrenocortical function. The ACTH function test for the adrenal cortex remains unchanged. The reduction in corticosteroid excretion and the elevation of plasma corticosteroids are due to an increased cortisol-binding capacity of the plasma proteins.

The response to metyrapone is less pronounced than in untreated women and is thus similar to that during pregnancy.

The radio-iodine uptake shows that thyroid function is unchanged. There is a rise in serum protein-bound iodine, similar to that in pregnancy and during the

administration of oestrogens. This is due to the increase capacity of the plasma proteins for binding thyroid hormones, rather than to any change in glandular function. In women taking oral contraceptives, the content of protein-bound iodine in blood serum should therefore, not be used for evaluation of thyroid function.

Effect on blood chemistry: Oral contraceptives may accelerate erythrocyte sedimentation in the absence of any disease. This effect is due to a change in the proportion of the plasma protein fractions. Increases in plasma copper, iron and alkaline phosphatase have also been recorded.

Overdosage: There have been no reports of serious ill effects from overdosage, even when a considerable number of tablets have been taken by a small child. In general, it is, therefore, unnecessary to treat overdosage. However, if overdosage is discovered within two or three hours and is so large that treatment seems desirable gastric lavage can be safely used.

There are no specific antidotes and further treatment should be symptomatic.

Pharmaceutical precautions Store in cool, dry conditions.

Shelf-life:

Eugynon 30 and Microgynon 30 – 5 years.

GASTROGRAFIN®

Presentation Gastrografin contains 10% sodium diatrizoate and 66% meglumine diatrizoate in aqueous solution, with added flavouring and wetting agents. The iodine content is 370 mg/ml.

Uses Gastrografin is designed for investigation of the gastro-intestinal tract. It can be used either orally or as an enema. Follow-through examinations with barium can often be improved by combining it with Gastrografin. Gastrografin is of considerable value in the following instances.

1. Suspected partial or complete stenosis.
2. Acute haemorrhage.
3. Threatening perforation (peptic ulcer, diverticulum).
4. Megacolon.
5. Foreign bodies or tumours.
6. Gastro-colic fistula.
7. Before endoscopy.

Gastrografin is also recommended for the treatment of uncomplicated meconium ileus.

Dosage and administration Oral – Adults and children of 10 years of age or over: 60 ml Gastrografin

re sufficient for the visualisation of the stomach. Up to 100 ml may be needed for a follow-through examination of the gastro-intestinal tract.

For elderly or cachectic patients: Dilution with an equal volume of water is recommended.

Children up to 10 years of age: 15–30 ml are usually sufficient. This dose may be diluted with an equal volume of water.

For infants and debilitated small children: It is recommended that the contrast medium be diluted with twice its volume of water.

Rectal – Adults: The contrast medium should be diluted with three to four times its volume of water. Not more than 500 ml of Gastrografin solution should normally be required.

Children: The contrast medium should be diluted with four to five times its volume of water; up to five years of age the weaker dilution should be used.

Gastrografin and Barium Sulphate: Oral and rectal administration.

Adults: 30 ml Gastrografin plus the usual dose of barium should be adequate.

Children: 10 ml Gastrografin may be added to the barium.

For children up to five years of age: from 2–5 ml Gastrografin to 100 ml barium may be preferable. Further dilution which does not affect the contrast may be used if necessary in cases of pylorospasm or pyloric stenosis.

For the early diagnosis of a perforation or anastomosis in the oesophagus or gastro-intestinal tract, the patient should drink 100 ml Gastrografin. After 30–60 minutes later, if the defect is suspected of being in the distal gut, a urine specimen should be taken and 5 ml mixed with 5 drops of concentrated hydrochloric acid. The contrast medium which has undergone renal excretion will appear immediately or within two hours as a typical crystal formation in the precipitate.

Technique for the treatment of uncomplicated meconium ileus: Gastrografin can be given by enema to infants for non-operative treatment of uncomplicated meconium ileus, i.e. in the absence of volvulus, gangrene, perforation, peritonitis or atresia, all of which require immediate operation.

A large syringe and soft rubber catheter, No. 8 French, are recommended. The buttocks can be taped tightly together to minimise leakage but a Foley catheter should not be used. The procedure must be carried out slowly and only under fluoroscopic control. Injection should stop as soon as Gastrografin is seen to enter the ileum. Owing to its high osmolality, Gastrografin may cause the loss of a large amount of fluid into the intestines. An intravenous drip must therefore be set up before the enema is given and plasma should be infused as required. If the Gastrografin is not expelled during the first hour after removal of the rectal catheter, an X-ray should be taken to ensure that over-distension of the bowel as a result of the high osmolality of Gastrografin has not occurred.

Contra-indications, warnings, etc

Contra-indications: Hypersensitivity to iodine-containing contrast media.

Because of its high osmotic pressure and minimal absorption, Gastrografin should not be administered to infants in higher doses than those recommended above. Gastrografin must not be given to a dehydrated infant

unless appropriate measures for correcting electrolyte and water balance have been taken before investigation.

Warnings/side-effects: Caution should be observed in patients with thyroid disease. Patients with enteritis or colitis may experience a transitory worsening of their symptoms. Caution is required in cases of oesophago-tracheal fistulae to avoid passage of the medium into the lungs, with consequent exudation of liquid. Systemic effects are rare, since Gastrografin is only minimally absorbed from the alimentary tract.

Owing to its hypertonicity, Gastrografin in full dosage may occasionally cause diarrhoea.

Pharmaceutical precautions *Storage:* Protect from light and heat. Shelf-life five years.

Legal category P.

Package quantities Bottles 5 × 100 ml.

Further information Nil.

Product licence number 0053/5023.

GONDAFON®

Presentation Each white, half-scored, torpedo-shaped tablet contains 500 mg of glymidine (the sodium salt of 2-benzene-sulphonamido-5-methoxyethoxy-pyrimidine).

Uses Maturity-onset diabetes, not adequately controlled by diet alone.

Dosage and administration Generally, initial dosage of 2–3 tablets daily with breakfast, or rarely 2 with breakfast and 1 in the late afternoon. After stabilisation, 1 or 2 tablets with breakfast often suffices.

The maximum permissible dosage of 4 tablets daily should be taken as 3 tablets with breakfast and 1 in the late afternoon.

Contra-indications, warnings, etc

Contra-indications: Pregnancy; diabetic coma and pre-coma; acetonaemia, all forms of metabolic decompensation during infection, operations and severe stress conditions. Severe hepatic and renal disease.

As with all benzenesulphonamides, treatment should be stopped immediately if allergies or blood dyscrasias occur. Similarly, any patient likely to undergo a major operation should probably be transferred temporarily to insulin therapy.

Although Gondaфон has a short biological half-life, care should be taken to avoid insidious hypoglycaemia in the elderly patient. This can be mistaken for a stroke.

There is no known cross-allergy between Gondaфон and other sulphonylureas or sulphonamides. However, caution is recommended in giving Gondaфон to a person with a history of allergy to either of these classes of compound.

Gondaфон reduces the tolerance of ethyl alcohol.

Hypoglycaemia: Mild symptoms of hypoglycaemia should be treated with a sandwich. Severe hypoglycaemia in the conscious patient should be treated with 5 tablespoonfuls of sugar in a cup of tea or water or by 1 mg of glucagon intramuscularly and should be followed by a sandwich after symptoms have improved. Hypoglycaemic coma should be treated by 1 mg of glucagon intramuscularly or subcutaneously and 50–100 ml of 40% glucose or 50% dextrose solution intravenously.

After recovery, the patient should be watched for three

days, and should be questioned so that the circumstances in which the hypoglycaemic attack occurred can be identified and its recurrence prevented.

Warnings: side-effects: Adverse reactions occur infrequently with Gondafon, but the commonest appear to be skin eruptions and gastro-intestinal disorders. Very rarely, leucopenia and purpura have been reported.

Pharmaceutical precautions Store in cool, dry conditions: shelf-life five years.

Legal category POM.

Package quantities Packs of 100 tablets.

Further information Nil.

LOGYNON* (21-day) ▼

Presentation The memo-pack holds six light-brown tablets containing 30 mcg ethinylloestradiol and 50 mcg levonorgestrel, five white tablets containing 40 mcg ethinylloestradiol and 75 mcg levonorgestrel and ten ochre tablets containing 30 mcg ethinylloestradiol and 125 mcg levonorgestrel.

All tablets have a lustrous, sugar coating. The light-brown tablets bear a black C in a regular hexagon on both sides. The white and the ochre tablets bear a black B in a regular hexagon on both sides.

Uses Oral contraception and the recognised gynaecological indications for such oestrogen-progestogen combinations. The mode of action includes the inhibition of ovulation by suppression of the mid-cycle surge of luteinising hormone, the inspissation of cervical mucus so as to constitute a barrier to sperm, and the rendering of the endometrium unreceptive to implantation.

Dosage and administration *First treatment cycle:* 1 tablet daily for 21 days, starting with the tablet marked number 1, on the first day of the menstrual cycle.

Subsequent cycles: Each subsequent course is started when seven tablet-free days have followed the preceding course.

Changing from another combined oral contraceptive: The first tablet of Logynon should be taken on the first day of the withdrawal bleed which follows the previous oral contraceptive course. Alternatively where it is desirable to retain the previous routine of tablet-taking, Logynon may be started on the same day that the previous combined oral contraceptive would have been resumed, provided the patient has had a withdrawal bleed. In this case, however, additional (non-hormonal) contraceptive precautions, other than the rhythm, temperature or cervical-mucus methods, should also be used for the first 14 days.

Post-partum and post-abortion use: After pregnancy oral contraception is usually started as soon as spontaneous menstruation has been resumed. However, oral contraception can be started within 7–12 days of a vaginal delivery, provided that the patient is fully ambulant and there are no puerperal complications. Starting within 12 days of delivery obviates additional contraceptive precautions. After a first-trimester abortion, oral contraception may be started immediately.

Special circumstances requiring additional contraception: Incorrect administration: If a tablet is delayed, it should be taken as soon as possible, and if it is taken

within 12 hours of the correct time additional contraception is not needed. Further tablets should then be taken at the usual time. However, if the delay exceeds 12 hours, ovulation may occur. In those circumstances, all tablet or tablets delayed more than 12 hours should be omitted, the remaining tablets should be taken on the correct days at the usual time, and extra precaution (except the rhythm, temperature and cervical-mucus methods) should be used until the next withdrawal bleed.

Gastro-intestinal upset: Vomiting or diarrhoea may reduce the effectiveness of the tablets by preventing them from being fully absorbed. Therefore, it is advisable that an additional method of contraception be used throughout the remainder of the course concerned. Mild laxatives do not impair contraceptive action.

Interaction with other drugs: Some drugs accelerate the metabolism of oral contraceptives taken concurrently. Drugs suspected of having the capacity to reduce the efficacy of oral contraceptives include barbiturate, phenylbutazone, phenytoin, rifampicin, ampicillin and other antibiotics. It is, therefore, advisable to use non-hormonal methods of contraception (except the rhythm, temperature or cervical-mucus methods) in addition to the oral contraceptive as long as an extremely high degree of protection must be provided during treatment with such drugs.

Contra-indications, warnings, etc

Contra-indications: Pregnancy. Thrombotic disorders and a history of these conditions, sickle-cell anaemia and disorders of lipid metabolism and other conditions in which, in individual cases, there is known or suspected to be a much increased risk of thrombosis. Acute or severe chronic liver diseases. Dubin-Johnson syndrome. Rotor syndrome. History, during pregnancy, of idiopathic jaundice or severe pruritus. History of herpes gestationis. Mammary or endometrial carcinoma, or a history of these conditions. Abnormal vaginal bleeding of unknown cause. Deterioration of otosclerosis during pregnancy.

Warnings: There is a general opinion, based on statistical evidence, that users of combined oral contraceptive experience, more often than non-users, venous thromboembolism, arterial thrombosis, including cerebral and myocardial infarction, and subarachnoid haemorrhage. Full recovery from such disorders does not always occur and it should be realised that in a few cases they are fatal. How often these disorders occur in users of the modern low-dose pills is not known, but there are reasons for suggesting that they may occur less often than with older pills.

Certain factors may entail some risk of thrombosis, e.g. smoking, obesity, varicose veins, cardiovascular diseases, diabetes and migraine. The suitability of combined oral contraceptive should be judged according to the severity of such conditions in the individual case and should be discussed with the patient before she decides to take it. The risk of arterial thrombosis associated with oral contraceptives increases with age and this risk is aggravated by cigarette-smoking. The use of combined oral contraceptives by women in the older age-group, especially those who are cigarette-smokers should therefore be discouraged, and alternative methods advised.

The possibility cannot be ruled out that certain chronic diseases may occasionally deteriorate during the use of combined oral contraceptives (see 'Precautions'). Hepatic tumours have been reported very rarely in women

ing combined oral contraceptives, generally for a protracted period of time. A hepatic tumour should be considered in the differential diagnosis when upper abdominal pain, enlarged liver or signs of intra-abdominal hemorrhage occur.

Reasons for stopping oral contraception immediately: Onset or recurrence of migraine in patients who have never previously suffered from it. Exacerbation of pre-existing migraine. Any unusually frequent or unusually severe headaches. Any kind of acute disturbance of vision. Suspicion of thrombosis or infarction. Six weeks before elective operations and during immobilisation, e.g. after accidents, etc. Significant rise in blood-pressure. Jaundice. Clear exacerbation of conditions known to be capable of deteriorating during oral contraception or pregnancy. Pregnancy is a reason for stopping immediately because it has been suggested by some investigations that oral contraceptives taken in early pregnancy may slightly increase the risk of foetal malformations. Earlier investigations have failed to support these findings. The possibility therefore cannot be excluded, but it is stated that if a risk exists at all, it is very small.

Examinations: Examination of the pelvic organs, breasts & blood-pressure should precede the prescribing of a combined oral contraceptive, and should be repeated regularly. Before starting treatment, pregnancy must be excluded.

The following conditions require careful consideration: a history of severe depressive states, varicose veins, diabetes, hypertension, epilepsy, otosclerosis, multiple sclerosis, porphyria, tetany, disturbed liver function, gallstones, cardiovascular diseases, renal diseases, leukaemia, uterine fibroids, asthma, the wearing of contact lenses, or any disease that is prone to worsen during pregnancy. The first appearance or deterioration of any of these conditions may indicate that the oral contraceptive should be stopped.

The risk of the deterioration of chloasma, which is often not fully reversible, is reduced by the avoidance of excessive exposure to sunlight.

Side-effects: Occasional side-effects may include nausea, vomiting, headaches, breast tension, changed body weight or libido, depressive moods and chloasma.

Menstrual changes:

Reduction of menstrual flow: This is not abnormal and it is to be expected in some patients. Indeed, it may be beneficial where heavy periods were previously experienced.

Missed menstruation: Occasionally, withdrawal bleeding may not occur at all. If the tablets have been taken correctly, pregnancy is very unlikely, but should be ruled out before a new course of tablets is started.

Intermenstrual bleeding: Very light 'spotting' or heavier breakthrough bleeding may occur during tablet-taking, especially in the first few cycles. It appears to be generally of no significance, except where it indicates errors of tablet-taking, or where the possibility of interaction with her drugs exists (q.v.). However, if irregular bleeding persists, an organic cause should be considered.

Effect on adrenal and thyroid glands: Oral contraceptives have no significant influence on adrenocortical function. The ACTH function test for the adrenal cortex remains unchanged. The reduction in corticosteroid excretion and the elevation of plasma corticosteroids are due to an increased cortisol-binding capacity of the plasma proteins.

The response to metyrapone is less pronounced than

in untreated women and is thus similar to that during pregnancy.

The radio-iodine uptake shows that thyroid function is unchanged. There is a rise in serum protein-bound iodine, similar to that in pregnancy and during the administration of oestrogens. This is due to the increased capacity of the plasma proteins for binding thyroid hormones, rather than to any change in glandular function. In women taking oral contraceptives, the content of protein-bound iodine in blood serum should, therefore, not be used for evaluation of thyroid function.

Effect on blood chemistry: Oral contraceptives may accelerate erythrocyte sedimentation in the absence of any disease. This effect is due to a change in the proportion of the plasma protein fractions. Increases in plasma copper, iron and alkaline phosphatase have also been recorded.

Overdosage: There have been no reports of serious ill-effects from overdosage, even when a considerable number of tablets have been taken by a small child. In general, it is, therefore, unnecessary to treat overdosage. However, if overdosage is discovered within two or three hours and is so large that treatment seems desirable, gastric lavage can be safely used.

There are no specific antidotes and further treatment should be symptomatic.

Pharmaceutical precautions Store in cool, dry conditions: shelf-life five years.

Legal category POM.

Package quantities All Schering combined oral contraceptives are available in packs containing one month's supply.

Further information Nil.

Product licence number 0053/0085.

LOGYNON® ED ▼

Presentation The memo-pack holds six light-brown tablets containing 30 mcg ethinylloestradiol and 50 mcg levonorgestrel, five white tablets containing 40 mcg ethinylloestradiol and 75 mcg levonorgestrel, ten ochre tablets containing 30 mcg ethinylloestradiol and 125 mcg levonorgestrel and seven white placebo tablets.

All tablets have a lustrous, sugar coating. The light-brown tablets bear a black C in a regular hexagon printed on both sides. The white and the ochre tablets bear a black B in a regular hexagon on both sides. The white placebo tablets are larger and bear a black O in a regular hexagon.

Uses Oral contraception and the recognised gynaecological indications for such oestrogen-progestogen combinations. The mode of action includes the inhibition of ovulation by suppression of the mid-cycle surge of luteinising hormone, the inspissation of cervical mucus so as to constitute a barrier to sperm, and the rendering of the endometrium unresponsive to implantation.

Dosage and administration *First treatment cycle:* 1 tablet daily for 28 days, starting in the red sector on the first day of bleeding, the initial tablet being the one marked with the appropriate day of the week. In the first cycle only, an additional form of contraception (except the rhythm, temperature or cervical-mucus methods) must be used for the first 14 days of tablet-taking.

Subsequent cycles: Each subsequent course is started in the red sector on the day after the previous one has been finished. Pack, therefore, follows pack without interval.

Changing from high-dosed to low-dosed preparations: Additional (non-hormonal) precautions, other than the rhythm, temperature or cervical mucus methods, should also be used for the first 14 days when changing products.

Post-partum and post-abortion use: After pregnancy oral contraception is usually started as soon as spontaneous menstruation has been resumed. However, oral contraception can be started within 7–12 days of a vaginal delivery, provided that the patient is fully ambulant and there are no puerperal complications. Starting within 12 days of delivery obviates additional contraceptive precautions. After a first-trimester abortion, oral contraception may be started immediately.

Special circumstances requiring additional contraception: Incorrect administration: If a tablet is delayed, it should be taken as soon as possible, and if it is taken within 12 hours of the correct time additional contraception is not needed. Further tablets should then be taken at the usual time. However, if the delay exceeds 12 hours, ovulation may occur. In those circumstances, any tablet or tablets delayed more than 12 hours should be omitted, the remaining tablets should be taken on the correct days at the usual time, and extra precautions (except the rhythm, temperature and cervical-mucus methods) should be used until the next withdrawal bleed.

Gastro-intestinal upset: Vomiting or diarrhoea may reduce the effectiveness of the tablets by preventing them from being fully absorbed. Therefore, it is advisable that an additional method of contraception be used throughout the remainder of the course concerned. Mild laxatives do not impair contraceptive action.

Interaction with other drugs: Some drugs accelerate the metabolism of oral contraceptives taken concurrently. Drugs suspected of having the capacity to reduce the efficacy of oral contraceptives include barbiturates, phenylbutazone, phenytoin, rifampicin, ampicillin and other antibiotics. It is, therefore, advisable to use non-hormonal methods of contraception (except the rhythm, temperature or cervical-mucus methods) in addition to the oral contraceptive as long as an extremely high degree of protection must be provided during treatment with such drugs.

Contra-indications, warnings, etc

Contra-indications: Pregnancy. Thrombotic disorders and a history of these conditions, sickle-cell anaemia, disorders of lipid metabolism and other conditions in which, in individual cases, there is known or suspected to be a much increased risk of thrombosis. Acute or severe chronic liver diseases, Dubin-Johnson syndrome, Rotor syndrome. History, during pregnancy, of idiopathic jaundice or severe pruritus. History of herpes gestationis. Mammary or endometrial carcinoma, or a history of these conditions. Abnormal vaginal bleeding of unknown cause. Deterioration of otosclerosis during pregnancy.

Warnings: There is a general opinion, based on statistical evidence, that users of combined oral contraceptives experience, more often than non-users, venous thromboembolism, arterial thrombosis, including cerebral and myocardial infarction, and subarachnoid haemorrhage. Full recovery from such disorders does not always occur, and it should be realised that in a few cases they are

fatal. How often these disorders occur in users of the modern low-dose pills is not known, but there are reasons for suggesting that they may occur less often than with older pills.

Certain factors may entail some risk of thrombosis, e.g. smoking, obesity, varicose veins, cardiovascular diseases, diabetes and migraine. The suitability of combined oral contraceptive should be judged according to the severity of such conditions in the individual case and should be discussed with the patient before she decides to take it. The risk of arterial thrombosis associated with oral contraceptives increases with age and this risk is aggravated by cigarette-smoking. The use of combined oral contraceptives by women in the older age-group, especially those who are cigarette-smokers, should therefore be discouraged, and alternative methods advised.

The possibility cannot be ruled out that certain chronic diseases may occasionally deteriorate during the use of combined oral contraceptives (see 'Precautions'). Hepatic tumours have been reported very rarely in women taking combined oral contraceptives, generally for protracted period of time. A hepatic tumour should be considered in the differential diagnosis when upper abdominal pain, enlarged liver or signs of intra-abdominal haemorrhage occur.

Reasons for stopping oral contraception immediately

Occurrence of migraine in patients who have never previously suffered from it. Exacerbation of pre-existing migraine. Any unusually frequent or unusually severe headaches. Any kind of acute disturbance of vision. Suspicion of thrombosis or infarction. Six weeks before elective operations and during immobilisation, e.g. after accidents, etc. Significant rise in blood-pressure. Jaundice. Clear exacerbation of conditions known to be capable of deteriorating during oral contraception or pregnancy. Pregnancy is a reason for stopping immediately because it has been suggested by some investigations that oral contraceptives taken in early pregnancy may slightly increase the risk of foetal malformations. Other investigations have failed to support these findings. The possibility therefore cannot be excluded, but it is certain that if a risk exists at all, it is very small.

Precautions: Examination of the pelvic organs, breast and blood-pressure should precede the prescribing of any combined oral contraceptive, and should be repeated regularly. Before starting treatment, pregnancy must be excluded.

The following conditions required careful consideration: a history of severe depressive states, varicose veins, diabetes, hypertension, epilepsy, otosclerosis, multiple sclerosis, porphyria, tetany, disturbed liver function, gallstones, cardiovascular diseases, renal diseases, chloasma, uterine fibroids, asthma, the wearing of contact lenses, or any disease that is prone to worsen during pregnancy. The first appearance or deterioration of any of these conditions may indicate that the oral contraceptive should be stopped.

The risk of the deterioration of chloasma, which is often not fully reversible, is reduced by the avoidance of excessive exposure to sunlight.

Side-effects: Occasional side-effects may include nausea, vomiting, headaches, breast tension, changed body weight or libido, depressive moods and chloasma.

Menstrual changes:

1. **Reduction of menstrual flow:** This is not abnormal and it is to be expected in some patients. Indeed, it may

be beneficial where heavy periods were previously experienced.

2. Missed menstruation: Occasionally, withdrawal bleeding may not occur at all. If the tablets have been taken correctly, pregnancy is very unlikely, but should be ruled out before a new course of tablets is started.

Intermenstrual bleeding: Very light 'spotting' or heavier breakthrough bleeding may occur during tablet-taking, especially in the first few cycles. It appears to be generally of no significance, except where it indicates errors of tablet-taking, or where the possibility of interaction with other drugs exists (q.v.). However, if irregular bleeding is persistent, an organic cause should be considered.

Effect on adrenal and thyroid glands: Oral contraceptives have no significant influence on adrenocortical function. The ACTH function test for the adrenal cortex remains unchanged. The reduction in corticosteroid excretion and the elevation of plasma corticosteroids are due to an increased cortisol-binding capacity of the plasma proteins.

The response to metyrapone is less pronounced than in untreated women and is thus similar to that during pregnancy.

The radio-iodine uptake shows that thyroid function is unchanged. There is a rise in serum protein-bound iodine, similar to that in pregnancy and during the administration of oestrogens. This is due to the increased capacity of the plasma proteins for binding thyroid hormones, rather than to any change in glandular function. In women taking oral contraceptives, the content of protein-bound iodine in blood serum should, therefore, not be used for evaluation of thyroid function.

Effect on blood chemistry: Oral contraceptives may accelerate erythrocyte sedimentation in the absence of any disease. This effect is due to a change in the proportion of the plasma protein fractions. Increases in plasma copper, iron and alkaline phosphatase have also been recorded.

Overdosage: There have been no reports of serious ill-effects from overdosage, even when a considerable number of tablets have been taken by a small child. In general, it is, therefore, unnecessary to treat overdosage. However, if overdosage is discovered within two or three hours and is so large that treatment seems desirable, gastric lavage can be safely used.

There are no specific antidotes and further treatment should be symptomatic.

NEOGEST*

Presentation Each round, dark brown, sugar-coated tablet bears a printed white D in a white regular hexagon on both sides and contains 37.5 mcg levonorgestrel (formerly known as D-norgestrel) contained in 75 mcg norgestrel.

Uses Oral contraception.

Mode of action: The contraceptive action of Neogest may be explained as follows.

It changes the cervical mucus so that a barrier is formed against the migration of sperm into the uterine cavity. Nidation is impeded because of changes in the structure of the endometrium. As a rule there is no inhibition of ovulation. Evidence suggests that a reduction in corpus-luteum function may also contribute to the contraceptive action.

Dosage and administration The first tablet is taken on the first day of menstrual bleeding at a time chosen by the patient. All subsequent tablets must then be taken at this time. The contraceptive effect is likely to be reduced if a tablet is delayed more than three hours. The tablets are taken daily and pack follows pack without interruption for as long as protection against conception is required. The contraceptive action begins after 14 tablets have been taken.

When starting oral contraception with Neogest, additional precautions other than the rhythm or temperature methods must be used for the first 14 days of tablet-taking.

Use after delivery or abortion: Although after delivery or abortion it is customary to start oral contraception at the end of the first biphasic menstrual cycle, Neogest may be started as early as the 7th day post partum.

Use during breast feeding: There is no evidence that Neogest diminishes the yield of breast milk. Radio-activity can be found in the milk after the administration of labelled levonorgestrel. However, it is not known whether the metabolites which appear in minute amounts in the milk and do not accumulate in the infant's tissues are biologically active.

Contra-indications, warnings, etc

Contra-indications: History during pregnancy, of idiopathic jaundice or severe pruritus. Dubin-Johnson and Rotor syndromes, acute and severe chronic liver diseases; pregnancy. History of herpes gestationis. Although no association between progestogen-only oral contraceptives and thromboembolic disorders has been shown, it is at present required that a history of such disorders be described as a contra-indication to Neogest, as it is to oestrogen-containing oral contraceptives.

Warnings/side-effects: Clinical investigations indicate that, in general, Neogest is very well tolerated. Symptoms reported in isolated cases include nausea, vomiting, dizziness, headaches, migraine, depressive moods, disturbances of appetite, allergic reactions. Amenorrhoea and changes in the pattern of the menstrual cycle have also been observed (For details see 'Menstrual pattern').

Circumstances requiring additional contraceptive precautions, other than the temperature, rhythm and cervical-mucus methods.

1. If a tablet is taken more than three hours late (i.e. if it is more than 27 hours since the last tablet was taken), protection against conception may be impaired. From the time of such an error, extra nonhormonal methods must be employed until 14 consecutive tablets have been taken in the correct manner.

2. When changing over to Neogest from other hormonal contraceptives, additional contraceptive measures must be employed until 14 consecutive tablets have been taken regularly.

3. Vomiting or diarrhoea may reduce the effectiveness of the tablets by preventing them from being fully absorbed. If vomiting occurs shortly after a tablet has

been taken, the contraceptive protection may be maintained if a second tablet is taken within three hours of the normal time, provided that vomiting does not recur. It is advisable to take the last tablet of the pack for this purpose, so as to avoid confusion.

In the case of repeated vomiting, or continued diarrhoea, additional contraceptive measures should be employed for a further 14 days after the symptoms have subsided.

4. Interaction with other drugs. Some drugs accelerate the metabolism of oral contraceptives taken concurrently. Drugs suspected of having the capacity to reduce the efficacy of oral contraceptives include barbiturates, phenylbutazone, phenytoin, rifampicin, ampicillin and other antibiotics. It is, therefore, advisable to use non-hormonal methods of contraception (except the rhythm, temperature or cervical-mucus methods) during treatment with such drugs.

Menstrual pattern: A usual feature of all progestogen-only oral contraceptives is that they produce an initial irregularity of the bleeding pattern, but such irregularity tends to decrease with time.

The patient should be informed before starting Neogest that her menstrual pattern is likely to alter.

Procedure in the case of cycle disturbances: Irregular bleeding is from a medical point of view no reason for discontinuing therapy, as long as organic causes and pregnancy can be ruled out.

If amenorrhoea lasts longer than three months, or occurs repeatedly, administration of Neogest should be suspended until regular cyclical bleeding has been re-established.

No attempt must be made to control irregular cycles by the additional administration of oestrogens since they would reverse the effect of Neogest on the cervical mucus, thus seriously reducing the contraceptive efficacy.

Reasons for stopping oral contraception immediately: First signs of thrombophlebitis or thromboembolism. Jaundice. Pregnancy.

Overdosage: There have been no reports of serious ill-effects from overdosage even when a considerable number of tablets have been taken by a small child. In general, it is, therefore, unnecessary to treat overdosage. However, if overdosage is discovered within two or three hours and is so large that treatment seems desirable, gastric lavage can be safely used. There are no specific antidotes and further treatment should be symptomatic.

Product licence number 0053/0062.

NERISONE* CREAM, OILY CREAM AND OINTMENT

Presentation *Cream* (oil-in-water emulsion), *oily cream* (water-in-oil emulsion) and *ointment* (anhydrous base): 1 g of each Nerisone presentation contains 1 mg (0.1%) diflucortolone valerate.

Uses Corticoid-responsive dermatoses in the absence of infection.

Dosage and administration Initially 2–3 applications daily, according to the severity of the condition. For maintenance, one application daily.

Nerisone is available in three bases. The base chosen for an individual case should depend on the physical characteristics of the lesion. For example, in very dry and chronic skin conditions, the occlusive effect of the Nerisone ointment base aids the healing process.

Contra-indications, warnings, etc

Contra-indications: Rosacea and peri-oral dermatitis. Viral infections. Bacterial or fungal infections of the skin in the absence of appropriate anti-infective therapy. Nerisone is not suitable for the treatment of ophthalmic conditions.

Warnings/side-effects: In infants, long-term continuous therapy with topical corticosteroids should be avoided. Adrenal suppression can occur, even without occlusion. Topical administration of corticosteroids to pregnant animals can cause abnormalities of foetal development. The relevance of this finding to human beings has not been established. However, topical steroids should not be used extensively during the first trimester of pregnancy, i.e. in large amounts or for prolonged periods.

In common with all other topical corticoids, side-effects may occur when Nerisone is applied to large areas of the body (10% or more) and for long periods of time (more than four weeks), especially if the ointment or an occlusive dressing is being used. These may be local signs such as atrophy of the skin, telangiectasia, striae and acneiform changes, or systemic corticoid effects caused by absorption. Therefore, caution should be exercised when using occlusive dressings, as there is a possibility that natural steroid production may be depressed.

Babies and children up to the age of 4 years should not be treated with Nerisone for longer than three weeks – particularly on skin areas covered by nappies.

Nerisone may be applied under an occlusive dressing. However, each dressing should not be left on for more than 24 hours. Although occlusive dressings may be used repeatedly, it should be noted that systemic corticoid absorption is likely to be increased with a consequent increased risk of adrenal suppression. Should secondary infection occur during treatment, the use of occlusive dressings should be postponed until the infection has been controlled.

Pharmaceutical precautions Store in cool, dry conditions.

Shelf-life: Five years.

Legal category POM.

Package quantities 30 g tubes.

Further information Nil.

Product licence numbers

Nerisone Cream	0053/0075
Nerisone Oily Cream	0053/0073
Nerisone Ointment	0053/0074

NERISONE* FORTE OILY CREAM AND OINTMENT

Presentation *Oily cream* (water-in-oil emulsion) and *ointment* (anhydrous base). 1 gram of each Nerisone Forte presentation contains 3 mg (0.3%) diflucortolone valerate.

Uses Initial and intermittent treatment of severe and recalcitrant corticoid-responsive dermatoses in the absence of infection. These include psoriasis, neurodermatitis (endogenous eczema, atopic dermatitis), lichen planus, discoid lupus erythematosus and severe chronic eczema.

Dosage and administration Initially, two or three thin applications daily, according to the severity of the condition. Once the clinical picture has improved, the patient should be changed from Nerisone Forte to Nerisone, for maintenance therapy.

Nerisone Forte is available in two bases.

Nerisone Forte Oily Cream: This is an emulsion of water in oil. Because it is an emulsion, it allows heat and exudate to pass freely through, while the oil component protects against undesirable drying out of the skin.

Nerisone Forte Ointment: This has an anhydrous fatty base, which is particularly indicated in chronic and dry skin conditions. The softening and occlusive properties of this base often aid the healing process.

Contra-indications, warnings, etc

Contra-indications: Rosacea, acne and peri-oral dermatitis. Viral infections. Bacterial or fungal infections of the skin in the absence of appropriate anti-infective therapy. Nerisone is not suitable for the treatment of ophthalmic conditions.

Warnings/side-effects: In infants, long-term continuous therapy with topical corticosteroids should be avoided. Adrenal suppression can occur, even without occlusion. Topical administration of corticosteroids to pregnant animals can cause abnormalities of foetal development. The relevance of these findings to human beings has not been established. However, topical steroids should not be used extensively during the first trimester of pregnancy, i.e. in large amounts or for prolonged periods.

Only in rare cases, and preferably under the guidance of a dermatologist, should Nerisone Forte be considered for use on the face, or in babies and children up to the age of four, and then only briefly for the initial control of very severe lesions.

In view of the high efficacy and potency of Nerisone Forte, no more than 60 g a week should be applied, and it is suggested that treatment for one or two weeks should generally be sufficient to obtain control of even the most refractory lesion, after which a change to Nerisone can usually be made if maintenance therapy is necessary.

Since prolonged therapy with potent topical corticosteroids may cause local atrophic changes such as striae, thinning and telangiectasia, particularly in skin folds and where occlusive dressings are used, it is recommended that the progress of patients under treatment for more than one week with Nerisone Forte be reviewed weekly, and that repeat prescriptions be written only when the prescribing physician has again seen the patient.

Since absorption is increased with the use of occlusive dressings, these should not be left on for more than 24 hours. If secondary infection occurs during treatment, the use of occlusive dressings should be stopped until the infection has been eliminated, and appropriate treatment of the infection should be instituted if it persists.

Pharmaceutical precautions Store in cool, dry conditions.

Shelf-life: Five years.

Legal category POM.

Package quantities 15 g tubes.

Further information Nerisone Forte preparations contain neither parabens nor lanolin.

Nerisone Forte Ointment	0053/0100

NOCTAMID* ▼

Presentation Round, white, scored tablets. Those marked CG in a regular hexagon contain 0.5 mg lormetazepam. Those marked CF in a regular hexagon contain 1.0 mg lormetazepam.

Uses Noctamid is indicated for the short-term treatment of insomnia including difficulty in falling asleep and/or frequent nocturnal awakenings.

Dosage and administration

Adults: Normally 1.0 mg orally before retiring. In elderly patients 0.5 mg is recommended. Subsequently, the initial dosage may be doubled in individual cases if this proves necessary.

Children: Noctamid has not been evaluated for the treatment of children.

Contra-indications, warnings, etc

Contra-indications: Known sensitivity to benzodiazepines. Myasthenia gravis.

Precautions and warnings: Noctamid and other centrally-acting drugs such as phenothiazines enhance each other's actions, and hence careful monitoring of dosage is advised during co-prescription.

The effects of Noctamid are potentiated by alcohol.

Metabolic interactions between Noctamid and other drugs have not been studied and a close watch should be kept for possible interactions.

Prolonged use of benzodiazepines, especially in high dosage, may occasionally result in the development of some psychological dependence, with withdrawal symptoms on sudden discontinuation. Treatment in these cases should be withdrawn gradually. Careful usage seldom results in the development of dependence.

Patients taking Noctamid should be warned about the possible hazard from dizziness or drowsiness when driving or operating machinery. Elderly patients are particularly susceptible to these effects, and to confusion, as are those with organic brain disease.

The use of Noctamid during pregnancy is not recommended, both in accordance with the general principle that drugs should not be administered to pregnant women unless essential, and because the possibility of a harmful effect on the human foetus cannot be totally ruled out, although extensive animal tests have shown no teratogenic actions.

Side-effects: In general, Noctamid is very well tolerated. However the common side-effects of benzodiazepines, including headaches, nausea, drowsiness, blurring of vision, dizziness and ataxia may occur on the following day, particularly in unusually sensitive patients or when dosage has been excessive.

Rare behavioural adverse effects of benzodiazepines include paradoxical aggressive outbursts, excitement, confusion, and the uncovering of depression with suicidal tendencies. Even more rare side-effects reported with some benzodiazepines have been hypotension, gastrointestinal and visual disturbances, skin rashes,

urinary retention, changes in libido, blood dyscrasias, and jaundice, but they have not been reported with Noctamid.

Overdosage: As with other benzodiazepines, overdoses should not present a threat to life. General supportive measures should be used. Treatment is symptomatic, and gastric lavage may be of use if performed shortly after ingestion. If the patient is conscious, an emetic such as ipecacuanha may be given. The patient is likely to sleep, and a clear airway should be maintained.

Pharmaceutical precautions Store in a cool, dry place.

Shelf-life: five years.

Legal category POM.

Package quantities 1 mg-30 tablets and 100 tablets (blister packs), 0.5 mg-30 tablets and 100 tablets (blister packs).

Further information Lormetazepam is rapidly absorbed from the gastrointestinal tract and is conjugated in a simple one-step process to a pharmacologically inactive glucuronide.

There are no major metabolites.

1 mg tablets 0053/0118

NORGESTON*

Presentation Each round, white, sugar-coated tablet bears a printed black E in a black regular hexagon on both sides and contains 30 mcg levonorgestrel (formerly known as D-norgestrel).

Uses Oral contraception.

Mode of action: The contraceptive action of Norgeston may be explained as follows:

It changes the cervical mucus so that a barrier is formed against the migration of sperm into the uterine cavity. Nidation is impeded because of changes in the structure of the endometrium. As a rule there is no inhibition of ovulation. Evidence suggests that a reduction in corpus-luteum function may also contribute to the contraceptive action.

Dosage and administration The first tablet is taken on the first day of menstrual bleeding at a time chosen by the patient. All subsequent tablets must then be taken at this time. The contraceptive effect is likely to be reduced if a tablet is delayed more than three hours. The tablets are taken daily and pack follows pack without interruption for as long as protection against conception is required. The contraceptive action begins after 14 tablets have been taken.

When starting oral contraception with Norgeston, additional precautions other than the rhythm or temperature methods must be used for the first 14 days of tablet-taking.

Use after delivery or abortion: Although after delivery or abortion it is customary to start oral contraception at the end of the first biphasic menstrual cycle, Norgeston may be started as early as the seventh day post-partum.

Use during breast feeding: There is no evidence that Norgeston diminishes the yield of breast milk. Radioactivity can be found in the milk after the administration

of labelled levonorgestrel. However, it is not known whether the metabolites which appear in minute amount in the milk, and do not accumulate in the infant's tissues are biologically active.

Contra-indications, warnings, etc

Contra-indications: History, during pregnancy, of idiopathic jaundice or severe pruritus; Dubin-Johnson and Rotor syndromes; acute and severe chronic liver diseases; pregnancy. History of herpes gestationis. Although no association between progestogen-only oral contraceptives and thromboembolic disorders has been shown, it is at present required that a history of such disorders be described as a contra-indication to Norgeston, as it is to oestrogen-containing oral contraceptives. **Warnings/side-effects:** Clinical investigations indicate that, in general, Norgeston is very well tolerated. Symptoms reported in isolated cases include nausea, vomiting, dizziness, headaches, migraine, depressive moods, disturbances of appetite, allergic reactions. Amenorrhoea and changes in the pattern of the menstrual cycle have been observed. (For details, see 'Menstrual pattern'.)

Circumstances requiring additional contraceptive precautions, other than the temperature, rhythm and cervical-mucus methods.

1. If a tablet is taken more than three hours late (i.e. if it is more than 27 hours since the last tablet was taken), protection against conception may be impaired. From the time of such an error, extra non-hormonal methods must be employed until 14 consecutive tablets have been taken in the correct manner.

2. When changing over to Norgeston from other hormonal contraceptives, additional contraceptive measures must be employed until 14 consecutive tablets have been taken regularly.

3. Vomiting or diarrhoea may reduce the effectiveness of the tablets by preventing them from being fully absorbed. If vomiting occurs shortly after a tablet has been taken, the contraceptive protection may be maintained if a second tablet is taken within three hours of the normal time, provided that vomiting does not recur. It is advisable to take the last tablet of the pack for this purpose, so as to avoid confusion.

In the case of repeated vomiting, or continued diarrhoea, additional contraceptive measures should be employed for a further 14 days after the symptoms have subsided.

4. Interaction with other drugs. Some drugs accelerate the metabolism of oral contraceptives taken concurrently. Drugs suspected of having the capacity to reduce the efficacy of oral contraceptives include barbiturates, phenylbutazone, phenytoin, rifampicin, ampicillin and other antibiotics. It is, therefore, advisable to use non-hormonal methods of contraception (except the rhythm, temperature or cervical-mucus methods) during treatment with such drugs.

Menstrual pattern: A usual feature of all progestogen-only oral contraceptives is that they produce an initial irregularity of the bleeding pattern, but such irregularity tends to decrease with time.

The patient should be informed before starting Norgeston that her menstrual pattern is likely to alter.

Procedure in the case of cycle disturbances: Irregular bleeding is, from a medical point of view, no reason for discontinuing therapy, as long as organic causes and pregnancy can be ruled out.

If amenorrhoea lasts longer than three months, or

occurs repeatedly, administration of Norgeston should be suspended until regular cyclical bleeding has been re-established.

No attempt must be made to control irregular cycles by the additional administration of oestrogens, since they would reverse the effect of Norgeston on the cervical mucus, thus seriously reducing the contraceptive efficacy.

Reasons for stopping oral contraception immediately: First signs of thrombophlebitis or thromboembolism. Jaundice. Pregnancy.

Overdosage: There have been no reports of serious ill-effects from overdosage, even when a considerable number of tablets have been taken by a small child. In general, it is, therefore, unnecessary to treat overdosage. However, if overdosage is discovered within two or three hours and is so large that treatment seems desirable, gastric lavage can be safely used. There are no specific antidotes and further treatment should be symptomatic.

Pharmaceutical precautions *Storage:* Cool, dry conditions.

Shelf-life: Five years.

Legal category POM.

Product licence number 0053/0068.

PRIMOLUT N*

Presentation Each white, uncoated tablet is impressed with 'AN' in a regular hexagon on one side and contains 5 mg norethisterone BP.

Uses Metropathia haemorrhagica. Premenstrual syndrome. Postponement of menstruation. Endometriosis. Menorrhagia. Dysmenorrhoea.

A total dose of about 100–150 mg Primolut N (10–15 mg on each of 10 consecutive days) will produce complete secretory transformation of an endometrium which has been pretreated with oestrogens.

A particular advantage is that the menstruation-like withdrawal bleeding occurs consistently two to three days after stopping Primolut N.

During treatment with Primolut N the basal body temperature rises, as it does under the influence of endogenous progesterone in the second half of the menstrual cycle.

Dosage and administration The use of Primolut N is restricted to patients in whom there is no possibility of early pregnancy in the cycle concerned.

Metropathia haemorrhagica (dysfunctional uterine bleeding): 1 tablet 3 times daily for 10 days. Bleeding is arrested usually within 1–3 days. A withdrawal bleeding resembling normal menstruation occurs within 2–4 days after discontinuing treatment.

Prophylaxis against recurrence of dysfunctional bleeding: If there are no signs of resumption of normal ovarian function (no rise in the second half of the cycle of the morning temperature, which should be measured daily) recurrence must be anticipated. Cyclical bleeding can be established with 1 tablet twice daily from the 19th to the 26th day of the cycle.

Premenstrual syndrome (including premenstrual mastalgia): Premenstrual symptoms such as headache,

migraine, breast discomfort, water retention, tachycardia and psychic disturbances may be relieved by the administration of 2–3 tablets daily from the 19th to the 26th day of the cycle. Treatment should be repeated for several cycles. When treatment is stopped, the patient may remain symptom-free for a number of months.

Postponement of menstruation: In cases of too frequent menstrual bleeding, and in special circumstances (e.g. operations, travel, sports) the postponement of menstruation is possible, 1 tablet Primolut N three times daily, starting 3 days before the expected onset of menstruation. A normal period should occur 2–3 days after the patient has stopped taking tablets.

Dysmenorrhoea: Functional or primary dysmenorrhoea is almost invariably relieved by the suppression of ovulation. 1 tablet three times daily for 20 days, starting on the fifth day of the cycle (the first day of menstruation counting as day 1). Treatment should be maintained for three to four cycles followed by treatment-free cycles. A further course of therapy may be employed if symptoms return.

Endometriosis (pseudo-pregnancy therapy): Longterm treatment is commenced on the 5th day of the cycle with 2 tablets Primolut N daily for the first few weeks. In the event of spotting, the dosage is increased to 4 and, if necessary, 5 tablets daily.

After bleeding has ceased, the initial dose is usually sufficient. Duration of treatment: 4–6 months continuously, or longer if necessary.

Menorrhagia (hypermenorrhoea): 1 tablet 2–3 times a day from the 19th to the 26th day of the cycle (counting the first day of menstruation as day 1).

Note: If menstrual bleeding should fail to follow a course of Primolut N, the possibility of pregnancy must be ruled out before a further course is given.

Contra-indications, warnings, etc

Contra-indications: Pregnancy. Severe disturbance of liver function. Dubin-Johnson and Rotor syndromes. History during pregnancy of idiopathic jaundice, severe pruritus or herpes gestationis.

Warnings/side-effects: Rarely occur in doses of 15 mg daily. Amongst those recorded are slight nausea, exacerbation of epilepsy and migraine. With extremely high dosage there may be cholestatic liver changes.

Overdosage: There have been no reports of ill-effects from overdosage and treatment is generally unnecessary. If overdosage is discovered within two or three hours and is so large that treatment seems desirable, gastric lavage can safely be used.

There are no special antidotes, and further treatment should be symptomatic.

Pharmaceutical precautions Store in cool dry conditions: shelf-life five years.

Legal category POM.

Package quantities Bottles of 100 tablets. Containers of 500 tablets.

Further information Nil.

Product licence number 0053/5033.

PRIMOTESTON* DEPOT 250 mg

Presentation Primoteston Depot 250 mg contains testosterone oenanthate 250 mg per ml in clear non-aqueous solution for intramuscular injection.

Uses Mammary carcinoma in the female. Androgen deficiency in the male.

Primoteston Depot is a depot androgen for use when male sex hormones are indicated. Testosterone enanthate has not only a sustained androgenic effect but also a very powerful one, since testosterone in this depot form is particularly well utilised by the body.

Dosage and administration *In the female. Advanced mammary carcinoma:* In advanced mammary carcinoma with metastases or recurrences, high-dosage therapy causes objective remission in some cases and frequently subjective improvement. In responsive cases, pain is diminished and the general condition considerably improved. Bone metastases are often affected favourably. In order to sustain a remission for as long as possible, it is sometimes necessary after a time to shorten the interval between injections. If hypercalcaemia occurs, treatment must be discontinued. In women over 60 years of age, treatment with oestrogens is often more effective.

Dosage: 250 mg Primoteston Depot intramuscularly every two weeks.

In the male: Hypogonadism: To stimulate development of underdeveloped androgen-dependent organs and for initial treatment of deficiency symptoms, 250 mg Primoteston Depot intramuscularly every two to three weeks.

For maintenance treatment: 250 mg Primoteston Depot intramuscularly every three to six weeks, according to individual requirement.

Contra-indications, warnings, etc

Contra-indications: Prostatic carcinoma and pregnancy.

Warnings/side-effects: With high dosage and prolonged testosterone therapy, an increased tendency to fluid retention and oedema is seen occasionally. In patients with a tendency to oedema, therefore, caution is indicated unless the oedema is due to lack of protein, when the protein-anabolic effect of Primoteston Depot is beneficial.

With prolonged use and high dosage of androgens in women, symptoms of virilisation must be expected. Regular examination of the prostate is advisable for men receiving androgen therapy.

Pharmaceutical precautions Store in cool, dry conditions away from strong sunlight: shelf-life five years.

Legal category POM.

Package quantities Ampoules of 250 mg, 3 × 1 ml.

Further information Nil.

Product licence number 0053/5037.

PROGYNOVA* 1 mg PROGYNOVA* 2 mg

Presentation *Progynova 1 mg:* Each beige, sugar-coated tablet bears a printed black B in a black regular hexagon and contains 1 mg of oestradiol valerate.

Progynova 2 mg: Each pale blue, sugar-coated tablet bears a printed red B in a red regular hexagon and contains 2 mg of oestradiol valerate.

Uses The treatment of climacteric symptoms in the short term in postmenopausal women (i.e. who have had no uterine bleeding for at least 12 months).

Dosage and administration One tablet of Progynova 1 mg daily for 21 days, followed by an interval of at least seven days before the next course. If the response is inadequate, Progynova 2 mg may be substituted, but the lowest dose compatible with the control of symptom should always be used, and an attempt should be made to revert to Progynova 1 mg after symptoms have been satisfactorily controlled. However, it should be realised that the appropriate dosage will be determined by the individual patient's rate of metabolism of Progynova rather than by the initial severity of the symptoms.

Alternatively, if the response to Progynova 1 mg is inadequate, Cyclo-Progynova can be substituted and in general when high-dose oestrogen therapy is required, oestrogen-progestogen combinations are recommended.

Bleeding: If possible, a dosage should be found that will abolish climacteric symptoms without inducing endometrial bleeding. Non-recurrent bleeding of short duration in the tablet-free intervals is usually due to oestrogen withdrawal. Any recurrent bleeding occurring during tablet-taking should be investigated to exclude endometrial hyperplasia or carcinoma. If recurrent bleeding is found to be non-pathological, then Cyclo-Progynova which produces controlled shedding of the endometrium should be substituted. (For further information, see the data sheet for Cyclo-Progynova.)

The treatment of recurrences: If, after completion of short-term treatment and the withdrawal of Progynova climacteric symptoms should recur, further treatment should be with Cyclo-Progynova (except in hysterectomised patients, who may take Progynova without any limit on the duration of treatment, and without intervals).

Contra-indications, warnings, etc

Contra-indications: Pregnancy. Severe disturbances of liver function, jaundice or general pruritus during a previous pregnancy, Dubin-Johnson syndrome, Rotor syndrome, existing or previous thromboembolic processes, sickle-cell anaemia, suspected or existing hormone-dependent disorders or tumours of the uterus or breast, congenital disturbances of lipid metabolism or atherosclerosis with deterioration in previous pregnancies.

Warnings/side-effects: Prolonged exposure to unopposed oestrogens may increase the risk of the development of endometrial carcinoma. The following have been reported during treatment: dyspepsia, flatulence, nausea, vomiting, abdominal pain and bloating, weight-gain, breast tension and pain, palpitations, cardiac symptoms, increased libido, headaches, dizziness, vertigo, epistaxis, biliary stasis, hypertension, urticaria and other rashes, thrombophlebitis, uterine bleeding, mucous vaginal discharge, general pruritus.

Diseases that are known to be subject to deterioration during pregnancy (e.g. multiple sclerosis, epilepsy, diabetes, hypertension, porphyria, tetany and otosclerosis) should be carefully observed during treatment.

Precautions and special information: Treatment should be stopped at once if migrainous or frequent and unusually severe headaches occur for the first time, or if there are any other symptoms that are possible prodromata of vascular occlusion.

Treatment should also be stopped if trauma, illness or impending surgery is considered to entail a risk of thrombosis.

Treatment should be stopped at once if jaundice occurs, or if there is a significant rise in blood-pressure.

In patients with mild chronic liver disease, liver function should be checked every 8–12 weeks.

Women with a family history of endometrial carcinoma should be carefully observed.

Examination of the pelvic organs, endometrium, breasts and blood-pressure is advised before and periodically during treatment with Progynova.

Overdosage: There have been no reports of ill-effects from overdosage, which it is, therefore, generally unnecessary to treat. If overdosage is discovered within two or three hours and is so large that treatment seems desirable, gastric lavage can safely be used. There are no specific antidotes, and further treatment should be symptomatic.

Pharmaceutical precautions Store in cool, dry conditions:

Shelf-life:

Progynova 1 mg 5 years.

Progynova 2 mg 7 years.

Legal category POM.

PROLUTON® DEPOT

(formerly PRIMULOT DEPOT)

Presentation Hydroxyprogesterone hexanoate BP 250 mg and 500 mg in ampoules and pre-loaded disposable syringe packs for intramuscular injection.

Uses Habitual abortion, when associated with proven progesterone-deficiency.

Dosage and administration 250–500 mg Proluton Depot at weekly intervals during the first half of pregnancy.

Contra-indications, warnings, etc

Contra-indications: A history of herpes gestationis.

Warnings: Many medicinal products, including female sex hormones, have been suspected of being capable of affecting the normal development of a child in the early stages of pregnancy. Many researchers consider that in relation to sex hormones such a suspicion is ill founded but one has to accept that for no medicinal product can a teratogenic activity be excluded with absolute certainty. Therefore, the general principle is now widely accepted that inessential use of drugs during pregnancy should be avoided. Following this general principle, Proluton Depot should be used to maintain pregnancy only if it is strictly indicated, i.e. if there is an urgent desire to have a child, especially if luteal insufficiency is present.

Since Proluton Depot may prevent spontaneous evacuation of a dead foetus (missed abortion) the progress of the pregnancy should be regularly monitored by appropriate means, including immunological tests.

Side-effects: Very rarely, local reactions may occur at the site of injection.

Pharmaceutical precautions Store in cool, dry conditions away from strong sunlight. Shelf-life five years.

Legal category POM.

Package quantities 250 mg: Packs of 3 and 20 ampoules 1 ml.

Preloaded disposable syringes. 1 ml, packed singly.

500 mg: Packs of 3 and 20 ampoules 2 ml.

Preloaded disposable syringes 2 ml, packed singly.

Further information Nil.

Proluton Depot 500 mg 0053/5032

PRO-VIRON®

Presentation Each white tablet has AX in a regular hexagon impressed on one side and is scored on the reverse. It contains 25 mg mesterolone.

Uses Androgen deficiency. Male infertility.

Pro-viron is an orally active androgen with properties quite distinct from those of older products. It offers unusual therapeutic possibilities because it can be given in high dosage over long periods. The presence of a methyl group at C-1 confers special properties on this steroid which, unlike testosterone and all its derivatives that are used for androgen therapy, is not metabolised to oestrogen.

This difference almost certainly accounts for the observation that in its usual therapeutic dosage in normal men, Pro-viron does not significantly depress the release of gonadotrophins from the pituitary. Hence (1) spermatogenesis is unimpaired. (2) unlike other androgens, which suppress and therefore replace endogenous androgens, Pro-viron supplements endogenous androgens.

Furthermore, in contrast to other orally active androgens, liver tolerance is excellent (a fact probably related to the absence of 17-alkyl substitution of the steroid nucleus).

Dosage and administration *Androgen deficiency:* Initially: 1 tablet three to four times daily, i.e. 75–100 mg daily for several months, followed by maintenance therapy of 2–3 tablets (50–75 mg) daily.

Male infertility: 100 mg daily for several months.

Contra-indications, warnings, etc

Contra-indications: In common with other androgens, Pro-viron is contra-indicated in the presence of prostatic carcinoma, since androgens can stimulate the growth of an existing carcinoma.

Warnings/side-effects: Reported side-effects have been rare, transient and minor. Regular examination of the prostate during treatment is advised, in order to exclude prostatic carcinoma.

Overdosage: There have been no reports of ill-effects from overdosage and treatment is generally unnecessary. If overdosage is discovered within two or three hours and is so large that treatment seems desirable, gastric lavage can safely be used.

There are no special antidotes and further treatment should be symptomatic.

Pharmaceutical precautions Store in cool, dry conditions, away from strong sunlight. Shelf-life five years.

Legal category POM.

Package quantities Bottles of 50 tablets.

Further information Nil.

Product licence number 0053/0030.

SCHERIPROCT* OINTMENT AND SUPPOSITORIES

Presentation Each white suppository contains:

Prednisolone hexanoate	1.3 mg
Dibucaine hydrochloride	1.0 mg
Clemizole undecylate	5.0 mg

A white ointment containing in 1 g:

Prednisolone hexanoate	1.9 mg
Dibucaine hydrochloride	5.0
Clemizole undecylate	10.0 mg

Uses Haemorrhoids, fissures, proctitis, pruritus ani and vulvae, and other inflammatory and allergic processes in the anal region.

Dosage and administration *Suppositories:* 1 Scheriproct Suppository to be inserted daily. In severe cases 1 suppository two to three times daily at the beginning of treatment. After complete disappearance of symptoms it is advisable to insert 1 suppository every second day for one further week. The suppositories should be inserted after defaecation.

Ointment: Apply in a thin layer twice daily. In order to obtain a more rapid improvement, Scheriproct Ointment may be applied three to four times on the first day. To avoid relapses, Scheriproct Ointment should be applied once a day for a few days after complete disappearance of the symptoms. The nozzle provided facilitates intra-rectal application.

Contra-indications, warnings, etc

Contra-indications: Viral infections. Bacterial or fungal infections of the skin in the absence of appropriate anti-infective therapy.

Warnings/side-effects: In infants, long-term continuous therapy with topical corticosteroids should be avoided. Adrenal suppression can occur, even without occlusion. Topical administration of corticosteroids to pregnant animals can cause abnormalities of foetal development. The relevance of these findings to human beings has not been established. However, topical steroids should not be used extensively during the first trimester of pregnancy, i.e. in large amounts or for prolonged periods. As with all topical steroids, there is a risk of developing skin atrophy following extensive therapy. The application of unusually large quantities of topical corticoids may result in the absorption of systemically active amounts of corticoid. Infections or secondarily infected dermatoses definitely require additional therapy with antibiotics or chemotherapeutic agents. This treatment can often be topical, but for heavy infections systemic antibacterial therapy may be necessary. If fungal infections are present, a topically active antimycotic should be applied.

Pharmaceutical precautions In order to restore the consistency of suppositories which have become soft owing to warm temperature, they should be put into cold water before the covering is removed.

Store in cool, dry conditions: shelf-life five years.

Legal category POM.

Package quantities *Suppositories:* Packs of 12.
Ointment: Tubes of 10 g.

Scheriproct Suppositories	0053/5001
Scheriproct Ointment	0053/5002

SH420*

Presentation Each uncoated, white tablet has AR in a regular hexagon impressed on one side, with quarter-scoring on the reverse. It contains 10 mg norethisterone acetate.

Uses Inoperable mammary carcinoma. As an adjunct to surgery and/or radiotherapy.

Note: Hormone therapy can never replace surgery or radiotherapy.

SH420 is a potent progestogen with a clinical efficacy which appears to be at least comparable to that of androgens and oestrogens in the treatment of inoperable mammary carcinoma. It does not, however, have the disadvantage of virilisation as with androgens and is unlikely to cause uterine bleeding as is the case with oestrogens. It may be used in the treatment of both pre- and post-menopausal women.

Although the mode of action of the various classes of hormone in inhibiting the growth of mammary carcinoma is not well understood, the very important role of the pituitary seems to be generally agreed on, as is shown by the response to pituitary ablation and hence to pituitary suppression by hormonal means.

SH420 is a powerful inhibitor of the pituitary. The effect of the progestogen may not depend wholly, however, on pituitary inhibition and it may be that an anti-oestrogenic effect as well as a direct effect on the tumour plays a part. Clinically SH420 has yielded subjective improvement (relief of pain and improvement in the general condition) and objective improvement (regression of tumour and/or bone and soft-tissue metastases).

Dosage and administration The recommended initial dosage of SH420 is 1 tablet three times a day (30 mg norethisterone acetate daily). If, after 6 weeks, no response is apparent, this can be increased to 2 tablets three times daily (60 mg daily).

Any remission obtainable should be apparent by the end of two months. If regression or arrest of tumour growth is obtained, treatment should be maintained as long as it continues to appear beneficial. If after about 9 weeks no response is apparent, none is to be expected and some other form of therapy should be tried.

Contra-indications, warnings, etc

Contra-indications:

Pregnancy. History of herpes gestationis.

Warnings/side-effects: The great advantage of SH420 over oestrogens and androgens is the almost complete freedom from side-effects.

Side-effects such as nausea, uterine bleeding and reversible cholestatic liver changes have occasionally been observed.

Overdosage: There have been no reports of ill-effects from overdosage and treatment is generally unnecessary. If overdosage is discovered within two or three hours and is so large that treatment seems desirable, gastric lavage can safely be used.

There are no special antidotes and further treatment should be symptomatic.

Pharmaceutical precautions Store in cool, dry

conditions, away from strong sunlight. Shelf-life five years.

gal category POM.

.TRABASE*

esentation Ultrabase is a white oil-in-water cream for topical application.

omponents: Polyoxyl 40 stearate, white soft paraffin, liquid paraffin, stearyl alcohol, carbopol 934, sodium dioxido, methylhydroxybenzoate (methyl-paraben), propylhydroxybenzoate (propyl-paraben), disodium-ethylate, demineralised water, crematest perfume oil.

ses Ultrabase is intended for general use as an emollient and as a diluent for dermatological preparations and as a vehicle for other medicaments. Additionally, it may be alternated with topical corticosteroids when the latter are being gradually withdrawn, and may be continued after complete withdrawal of the topical corticosteroid.

usage and administration The cream should be rubbed into the skin as often as required.

ontra-indications, warnings, etc There are no specific contra-indications to the use of Ultrabase, other than a known allergy to any of the components.

side-effects: No side-effects have been reported.

pharmaceutical precautions Store in cool, dry conditions, away from strong sunlight: shelf-life five years.

gal category GSL.

ckage quantities Tubes containing 50 g. Jars containing 500 g.

rther information Ultrabase is suitable as a diluent for Schering's corticoid cream preparations and as a vehicle for coal tar solutions, urea, resorcinol, zinc oxide and precipitated sulphur.

oduct licence number 0053/0063.

.TRADIL* OINTMENT PLAIN AND

TEAM PLAIN

.TRALANUM* OINTMENT PLAIN AND

TEAM PLAIN

esentation White creams (oil-in-water emulsions) and ointments (water-in-oil emulsions) with the following ingredients.

tradil Ointment plain and Cream plain: 0.1% fluocortolone pivalate BP and 0.1% fluocortolone hexanoate BP.

tralanum Ointment plain: 0.25% fluocortolone and 0.25% fluocortolone hexanoate BP.

tralanum Cream plain: 0.25% fluocortolone pivalate BP and 0.25% fluocortolone hexanoate BP.

Ultradil plain and Ultralanum plain are dilute and full-strength preparations respectively of the corticoid, corticosterone, and its esters.

ses *Ultradil Cream and Ointment plain:* Most eczemas, dermatoses and other corticoid-responsive skin

conditions in the absence of infection. Ultradil is particularly indicated when the patient is young, the skin area large or the treatment schedule prolonged.

Ultralanum Cream and Ointment plain: More severe corticoid-responsive skin conditions in the absence of infection.

Dosage and administration *Ultradil plain: (ointment and cream):* The usual initial dosage is 1 application three times a day, reducing to 1 application twice daily.

For maintenance one application daily.

Ultralanum plain: (ointment and cream): Initially 2-3 applications daily, according to severity of condition. For maintenance one application daily.

Contra-indications, warnings, etc

Contra-indications: Rosacea and peri-oral dermatitis. Viral infections. Bacterial or fungal infections of the skin in the absence of appropriate anti-infective therapy. Not suitable for the treatment of ophthalmic conditions.

Warnings/side-effects: In infants long-term continuous therapy with topical corticosteroids should be avoided. Adrenal suppression can occur even without occlusion. Topical administration of corticosteroids to pregnant animals can cause abnormalities of foetal development. The relevance of these findings to human beings has not been established. However, topical steroids should not be used extensively during the first trimester of pregnancy, i.e. in large amounts or for prolonged periods. ULTRALANUM* OINTMENT

Presentation A white ointment (water-in-oil emulsion) containing 0.25% fluocortolone and with 0.25% fluocortolone hexanoate BP and 2.5% clemizole hexachlorophane.

Uses Corticoid-responsive skin conditions complicated by bacterial infection.

Dosage and administration Initially, 2-3 applications daily according to the severity of the condition. For maintenance, one application daily.

Contra-indications, warnings, etc

Contra-indications: Rosacea and peri-oral dermatitis. Viral infections. Bacterial or fungal infections of the skin in the absence of appropriate anti-infective therapy. Not suitable for ophthalmic conditions. Since Ultralanum Ointment contains hexachlorophane, it must not be used for babies.

Warnings/side-effects: In infants, long-term continuous therapy with topical corticosteroids should be avoided. Adrenal suppression can occur, even without occlusion. Topical administration of corticosteroids to pregnant animals can cause abnormalities of foetal development. The relevance of these findings to human beings has not been established. However, topical steroids should not be used extensively during the first trimester of pregnancy, i.e. in large amounts or for prolonged periods. UROGRAFIN*

Presentation Ampoules, vials or bottles contain colourless sterile solutions of varying strengths: meglumine diatrizoate and meglumine/sodium diatrizoates.

Urografin 150: An intravenous injection of meglumine diatrizoate 26.1% w/v and sodium diatrizoate 3.9% w/v containing 146 mg iodine per ml.

Urografin 290: An intravascular injection of meglumine diatrizoate 52.1% w/v and sodium diatrizoate 7.9% w/v containing 292 mg iodine per ml.

Urografin 310M: An intravascular injection of meglumine diatrizoate 65% w/v, containing 306 mg iodine per ml.

Urografin 325: An intravenous injection of meglumine diatrizoate 18% w/v and sodium diatrizoate 40% w/v containing 325 mg iodine per ml.

Urografin 370: An intravascular injection of meglumine diatrizoate 66% w/v and sodium diatrizoate 10% w/v containing 370 mg iodine per ml.

Uses X-ray contrast media for the delineation of vascular and renal systems.

Dosage and administration See table on pages 9 and 983.

Contra-indications, warnings, etc

Contra-indications: Proven or suspected hypersensitivity to iodine-containing contrast media, manifest thyrotoxicosis and decompensated cardiac insufficiency.

Hysterosalpingography must not be carried out during pregnancy or in patients with acute inflammatory conditions in the pelvic cavity.

Warnings/side-effects: For patients with severe impairment of hepatic or renal function, cardiac or circulatory sufficiency, cerebral arterial sclerosis, epilepsy, poor general health, hyperthyroidism or multiple myeloma the need for examination with X-ray contrast media merits careful consideration.

This also applies to patients with a history of allergy, e.g. bronchial asthma, since experience shows that they may exhibit hypersensitivity to drugs. Because of possible precipitation, X-ray contrast media and prophylactic agents must not be injected as mixed solutions.

Particular caution should be exercised in allergic persons who have previously tolerated an injectable iodine-containing contrast medium without any complication because they may have become sensitized to these substances in the meantime.

The patient should be recumbent during the administration of Urografin. Thereafter, the patient must be kept under close observation for at least 15 minutes, since about 90% of all severe incidents occur within that time. The administration does not take place on the X-ray table, any patient with a labile circulation should be brought to the X-ray machine sitting or lying down.

In patients with multiple myeloma the fluid supply could not be restricted. This also applies to infants and young children, in whom disturbances of the balance of water and electrolytes must be corrected before the administration of a hypertonic contrast medium solution. X-ray examinations should if possible be avoided during pregnancy. It has not yet been proved beyond question that Urografin may be used without hesitation in pregnant patients. Therefore an examination with a contrast medium during pregnancy should be carried out only if considered absolutely necessary by the physician.

If iodine isotopes are to be administered for diagnosing thyroid disease, it should be borne in mind that after the administration of iodised contrast media which are excreted via the kidneys, the capacity of the thyroid tissue to take up iodine will be reduced for a few days, and sometimes up to 6 weeks.

Mild subjective symptoms, such as a feeling of heat and nausea, occur very seldom and disappear rapidly when the injection is slowed down or briefly interrupted. Persistent pain may occur, in particular during the

examination of peripheral vascular regions. Extravasations give rise to serious tissue reactions only in very rare cases.

If marked side-effects or suspected allergic reactions occur during injection and do not disappear, or even get worse, when the injection is briefly interrupted, it is probable that the patient has such a hypersensitivity and the investigation must be abandoned. Even relatively minor symptoms such as itching of the skin, sneezing, violent yawns, tickling in the throat, hoarseness or attacks of coughing may be early signs of a severe reaction and, therefore, merit careful attention.

Very rarely, severe or even life-threatening side-effects such as severe hypotension and collapse, circulatory failure, ventricular fibrillation, cardiac arrest, pulmonary oedema, anaphylactic shock or other allergic manifestations, convulsions, or other cerebral symptoms may occur.

Ready availability of all drugs and equipment for emergency treatment and familiarity with the respective procedures are prerequisites for the effective management of contrast-medium incidents. Some guidance in the treatment of such incidents is contained in the leaflet supplied with the pack.

Pharmaceutical precautions *Storage:* Protect from light and heat. Shelf-life five years.

Legal category POM.

Percutaneous cholangiography		20–30 ml			

^a100 ml and 200 ml vials are available for coronary arteriography

(Other indications include selective visceral angiography, limb venography, jugular venography, vesiculography, sialography, sinusography, amniography, lymphangiography, intramuscular urography, operative cholangiography, fistulography, oesophageal anal atresia.)

Urografin media are not suitable for myelography

Children and neonates

Intravenous urography: The fact that urograms of infants and young children generally show a lower contrast density than those of adults is explained by the physiologically less effective function of the immature nephron. Relatively high doses of media are therefore indicated.

	<i>Urografin 310M/290</i>		<i>Urografin 325/370</i>
Up to 1 year	8–12 ml	Up to 1 year	7–10 ml
–2 years	12–15 ml	1–2 years	10–12 ml

SEARLE

ALDACTIDE® 50
ALDACTIDE® 25

Presentation *Aldactide 50:* Buff, film-coated tablets engraved SEARLE 180 on one side containing Spironolactone BP 50 mg and Hydroflumethiazide BP 50 mg.

Aldactide 25: Buff, film-coated, scored tablets engraved SEARLE 101 on one side containing Spironolactone BP 25 mg and Hydroflumethiazide BP 25 mg.

Uses Hypertension. Congestive heart failure.

Dosage and administration *Adults: Essential hypertension:* Aldactide 50 – 1 or 2 tablets with breakfast or the first main meal of the day.

Aldactide 25 – 1 to 4 tablets with breakfast or the first main meal of the day.

Congestive heart failure: The requirements of most patients will be met by an initial dosage of 4 tablets Aldactide 25 or 2 tablets Aldactide 50 daily. The dosage should be adjusted as necessary and may range from 1 tablet Aldactide 25 to 8 tablets Aldactide 25 or 4 tablets Aldactide 50 daily.

Children: Although clinical trials using Aldactide have not been carried out in children, as a guide, a daily dosage providing 1.5 to 3 mg of spironolactone per kilogram body weight, given in divided doses, may be employed.

Contra-indications, warnings, etc Aldactide is contra-indicated in patients with anuria, acute renal insufficiency, rapidly progressing impairment of renal function, hyperkalaemia and in patients who are hypersensitive to either component. Aldactide should not be administered concurrently with other potassium-conserving diuretics as hyperkalaemia may be induced. For the same reason the use of potassium supplements in association with Aldactide therapy is also not recommended, except in cases of initial potassium depletion. If potassium supplementation is considered essential, serum electrolytes should be monitored.

Carcinogenicity: Spironolactone has been shown to produce tumours in rats when administered at high doses over a long period of time. The significance of these findings with respect to clinical use is not certain. However the long term use of spironolactone in young patients requires careful consideration of the benefits and the potential hazard involved.

Precautions: Patients receiving Aldactide therapy should be carefully evaluated for possible disturbances of fluid and electrolyte balance.

Hyperkalaemia may occur in patients with impaired renal function or excessive potassium intake and can cause cardiac irregularities which may be fatal. Should hyperkalaemia develop Aldactide should be discontinued, and if necessary, active measures taken to reduce the serum potassium to normal.

Hypokalaemia may develop as a result of profuse diuresis, particularly when Aldactide is used concurrently with loop diuretics, glucocorticoids or ACTH.

Caution should be observed in patients with severe liver disease as overvigorous diuretic therapy precipitate encephalopathy in susceptible patients. Periodic estimation of serum electrolytes is desirable.

Reversible increases in blood urea have been reported particularly accompanying vigorous diuresis or in presence of impaired renal function.

Dilutional hyponatraemia may be induced, especially when Aldactide is administered in combination with other diuretics.

Thiazides may cause hyperuricaemia and precipitate attacks of gout in some patients.

Thiazides may aggravate existing diabetes. Diabetes mellitus which has been latent may become manifest during thiazide administration.

Drug interactions: Potentiation of the effect of certain antihypertensive drugs occurs and their dosage need to be reduced by about 50% when Aldactide is added to the treatment regime, and then adjusted as necessary.

Pregnancy: Spironolactone or its metabolites may, hydroflumethiazide does, cross the placental barrier. Use of Aldactide in pregnant women requires that anticipated benefit be weighed against the possible hazards to the mother and foetus. These hazards include foetal or neonatal jaundice, thrombocytopenia, possibly other adverse effects that have been reported in adults.

Nursing mothers: Canrenone, a metabolite of spironolactone, and hydroflumethiazide appear in breast milk. Use of Aldactide is considered essential, an alternative method of infant feeding should be instituted.

Adverse effects: Gynaecomastia may develop in association with the use of spironolactone. Development appears to be related to both dosage level and duration of therapy and is normally reversible when Aldactide is discontinued. Other adverse reactions reported in association with spironolactone include: gastrointestinal intolerance, drowsiness, headache, mental confusion, skin rashes, menstrual irregularities, impotence and androgenic effects. Adverse reactions reported in association with thiazides include: gastrointestinal upset, skin rashes, blood dyscrasias, muscle cramps, headache, dizziness, vertigo, jaundice, orthostatic hypotension, impotence and paraesthesia. Rarely, hyperkalaemia has been reported in association with thiazides, usually in patients with pre-existing metabolic bone disease or parathyroid dysfunction.

Overdosage: Acute overdosage may be manifested by drowsiness, mental confusion, nausea, vomiting, diarrhoea or diarrhoea. Hyponatraemia, hypokalaemia, hyperkalaemia may be induced, or hepatic coma may be precipitated in patients with severe liver disease,

100-200 mg/day.
It is an anti-inflam-
matory process. Its
effects by themselves are

Idiopathic oedema including premenstrual oedema:
Usual dose - 100 mg/day.

Diagnosis and treatment of primary aldosteronism:
Aldactone may be employed as an initial diagnostic
measure to provide presumptive evidence of primary
hyperaldosteronism while patients are on normal diets.

Long test: Aldactone is administered at a daily dosage of
400 mg for three to four weeks. Correction of hypoka-
laemia and of hypertension provides presumptive evi-
dence for the diagnosis of primary hyperaldosteronism.

Short test: Aldactone is administered at a daily dosage
of 400 mg for four days. If serum potassium increases
during Aldactone administration but drops when Aldac-
tone is discontinued, a presumptive diagnosis of primary
hyperaldosteronism should be considered.

After the diagnosis of hyperaldosteronism has been
established by more definitive testing procedures, Al-
dactone may be administered in doses of 100 mg to
400 mg daily in preparation for surgery. For patients who
are considered unsuitable for surgery, Aldactone may be
employed for long-term maintenance therapy at the
lowest effective dosage determined for the individual
patient.

Essential hypertension: Usual dose - 50-100 mg per
day, which for difficult or severe cases may be gradually
increased at two weekly intervals up to 200 mg/day.

Treatment should be continued for two weeks or
longer since an adequate response may not occur before
this time. Dosage should subsequently be adjusted
according to the response of the patient.

Children: Initial daily dosage should provide 3 mg of
spironolactone per kilogram body weight, given in
divided doses. Dosage should be adjusted on the basis
of response and tolerance. If necessary a suspension
may be prepared by crushing Aldactone tablets. A
suitable suspending vehicle is Cologel® 20% v/v, purified
water to 100%. Such a suspension is stable for one
month when refrigerated.

Contra-indications, warnings, etc Aldactone is
contra-indicated in patients with anuria, acute renal
insufficiency, rapidly progressing impairment of renal
function, hyperkalaemia, and in patients who are hyper-
sensitive to spironolactone. Aldactone should not be
administered concurrently with other potassium-con-
serving diuretics as hyperkalaemia may be induced. For
the same reason the use of potassium supplements in
association with Aldactone therapy is also not recom-
mended, except in cases of initial potassium depletion.
If potassium supplementation is considered essential,
serum electrolytes should be monitored.

Carcinogenicity: Spironolactone has been shown to
produce tumours in rats when administered at high doses
over a long period of time. The significance of these
findings with respect to clinical use is not certain.
However the long-term use of spironolactone in young
patients requires careful consideration of the benefits
and the potential hazard involved.

Precautions: Patients receiving Aldactone therapy
should be carefully evaluated for possible disturbances
of fluid and electrolyte balance.

Hyperkalaemia may occur in patients with impaired
renal function or excessive potassium intake and can
cause cardiac irregularities which may be fatal. Should
hyperkalaemia develop Aldactone should be discontin-
ued, and if necessary, active measures taken to reduce
the serum potassium to normal.

Reversible increases in blood urea have been reported in association with Aldactone therapy, particularly in the presence of impaired renal function.

Dilutional hyponatraemia may be induced, especially when Aldactone is administered in combination with other diuretics.

Drug interactions: Potentiation of the effect of other antihypertensive drugs occurs and their dosage may need to be reduced by about 50% when Aldactone is added to the treatment regime, and then adjusted as necessary.

Pregnancy: Spironolactone or its metabolites may cross the placental barrier. The use of Aldactone in pregnant women requires that the anticipated benefit be weighed against the possible hazards to the mother and foetus.

Nursing mothers: Canrenone, a metabolite of spironolactone, appears in breast milk. If use of Aldactone is considered essential, an alternative method of infant feeding should be instituted.

Adverse effects: Gynaecomastia may develop in association with the use of spironolactone. Development appears to be related to both dosage level and duration of therapy and is normally reversible when Aldactone is discontinued. Other adverse reactions reported in association with spironolactone include: gastrointestinal intolerance, drowsiness, headache, mental confusion, skin rashes, menstrual irregularities, impotence and mild androgenic effects.

Overdosage: Acute overdosage may be manifested by drowsiness, mental confusion, nausea, vomiting, dizziness or diarrhoea. Hyponatraemia or hyperkalaemia may be induced but these effects are unlikely to be associated with acute overdosage. Symptoms of hyperkalaemia may manifest as paraesthesia, weakness, flaccid paralysis or muscle spasm and may be difficult to distinguish clinically from hypokalaemia. Electrocardiographic changes are the earliest specific signs of potassium disturbances. No specific antidote has been identified. Improvement may be expected after withdrawal of the drug. General supportive measures including replacement of fluids and electrolytes may be indicated. For hyperkalaemia, reduce potassium intake, administer potassium-excreting diuretics, intravenous glucose with regular insulin, or oral ion-exchange resins.

Pharmaceutical precautions Aldactone should be stored in a cool, dry place.

Legal category POM.

Package quantities *Aldactone 100 mg:* Calendar pack of 28 tablets and bottles containing 100 and 500 tablets.

Aldactone 25 mg: Bottles containing 100 and 500 tablets.

Further information Aldactone as a competitive aldosterone antagonist increases sodium excretion whilst reducing potassium loss at the distal renal tubule. It has a gradual and prolonged action, maximum response being usually attained after 2-3 days' treatment.

Combination of Aldactone with a conventional, more proximally acting diuretic usually enhances diuresis without excessive potassium loss.

Aldactone 25 mg 0020/5000

CONOVA* 30

Presentation White, film-coated tablets engraved SEARLE 930 on one side containing Ethynodiol Diacetate BP 2 mg and Ethinyloestradiol PhEur 0.03 mg.

Uses Oral contraception.

Dosage and administration One tablet daily for days, starting on Day 5 of the menstrual cycle (whilst Day 1 is the first day of bleeding). The next course of tablets should be started after seven tablet-free days. This 'three weeks on, one week off' regimen is continued for as long as contraception is required. Patients should be advised to use an additional form of contraception during the first 14 days of the first pack.

Missed tablets: Patients who miss a single tablet should be instructed to take the missed tablet as soon as they remember, even though this may mean taking two tablets on one single day. The regular tablet for that day should be taken at the usual time. An additional method of contraception (a sheath or a cap plus spermicide) should be used for the remainder of the cycle. If two consecutive tablets are missed, patients should be instructed to take two tablets each day for the next two days and use an additional method of contraception for the rest of the cycle. Those who miss more than two tablets should resume as soon as they remember, ignoring the tablets they have missed, and should use additional contraceptive precautions for the rest of the cycle.

Contra-indications, warnings, etc The contra-indications for combined oral contraceptives are: thrombophlebitis, thromboembolic disorders, cerebral vascular disease, myocardial infarction, coronary artery disease or a past history of these conditions, known, suspected or a past history of breast, genital or hormone dependent cancer; past or present, benign or malignant liver tumours; impaired liver function; active liver disease disorders of lipid metabolism; haemoglobinopathies, undiagnosed abnormal vaginal bleeding or amenorrhoea known or suspected pregnancy.

It has been established that the use of combined oral contraceptives is associated with an increase in the risk of thromboembolic and thrombotic disease.

Recent studies have indicated that combined oral contraceptives may be associated with an increased risk of myocardial infarction. The risk of arterial thrombosis associated with combined oral contraceptives increases with age, and this risk is aggravated by cigarette smoking. The use of combined oral contraceptives by women in the older age group, especially those who are cigarette smokers, should therefore be discouraged, and alternative methods advised.

Conova 30 should be discontinued at least six weeks before elective surgery or during periods of prolonged immobilisation. It would be reasonable to resume combined oral contraceptives two or three weeks after surgery provided the patient is ambulant. Every patient, however, should be considered individually with regard to the nature of the operation, the extent of immobilisation, the presence of additional risk factors and the chance of unwanted conception.

Discontinue treatment if there is a gradual or sudden partial or complete loss of vision or any evidence of ocular changes, onset or aggravation of migraine development of headache of a new kind which is recurrent, persistent or severe.

Patients with a history of jaundice during pregnancy

ve an increased risk of recurrence. Discontinue Conova 30 if jaundice occurs.

Precautions: Patients receiving treatment with oestrogen progestogen or both, should be kept under regular surveillance.

Caution should be exercised where there is the possibility of an interaction between a pre-existing disorder and a known or suspected side-effect. The use of Conova 30 in patients suffering from epilepsy, or with a history of migraine, or cardiac dysfunction may result in exacerbation of these disorders, because of fluid retention. Caution should also be observed in patients who wear contact lenses, patients with impaired carbohydrate tolerance, hypertension, asthma, varicose veins, any disease that is prone to worsen during pregnancy, and in young patients in whom the growth period has not yet ended.

Vomiting or diarrhoea may reduce the effectiveness of the tablets, particularly if this should occur at or around the time of ovulation.

Drug interactions: Conova 30 may be rendered less effective and increased incidence of breakthrough bleeding may occur by virtue of drug interaction with imipenem, isoniazid, ampicillin, neomycin, penicillin V, loramphenicol, sulphonamides, nitrofurantoin, barbiturates, phenytoin, primidone, anti-arthritics, analgesics, tranquilisers and anti-migraine preparations. Conova 30 may alter the effectiveness of other types of drugs, such as oral anticoagulants, anticonvulsants, tricyclic antidepressants, antihypertensive agents (e.g. guanethidine), aminoglycosides and hypoglycaemic agents. Therefore, the possibility of a drug interaction occurring in patients on any of these therapeutic agents should be considered when prescribing Conova 30.

Breast-feeding mothers: Active ingredients of oral contraceptives have been detected in the milk of mothers taking these drugs. The effect of Conova 30 on breast-fed infants has not been determined.

Adverse effects: Known or suspected side-effects of oral contraceptives include nausea, vomiting, other gastrointestinal symptoms, irregular vaginal bleeding, amenorrhoea, certain skin disorders, chloasma, breast and weight changes, ocular changes, headache, hypertension, migraine, depression, change in libido and appetite, increase in the size of uterine myofibromata, fluid retention, infertility after discontinuation, and changes in carbohydrate, lipid and vitamin metabolism.

Tests of endocrine, hepatic and thyroid function, as well as coagulation tests, may be affected by this preparation.

The use of oral contraceptives has also been associated with a possible increased incidence of gallbladder disease.

Benign hepatic adenomas, although rare, have been reported with long-term use of oral contraceptives.

Overdosage: Fatal overdosage has not been reported. Overdosage may be manifested by nausea, vomiting, breast engorgement and vaginal bleeding. Gastric lavage may not be necessary but demulcents such as milk, egg white or bismuth hydroxide may be helpful.

Pharmaceutical precautions Conova 30 should be stored in a cool dry place.

Legal category POM.

Packaging quantities Carton containing one strip of 21 tablets, with instructions.

Further information Conova 30 provides effective, low oestrogenic contraception in a form acceptable to most women. It is particularly suitable for new patients or patients switching from another oral contraceptive. Patients switching in this way should start Conova 30 seven days after finishing their current pack.

Product licence number 0020/0066.

DIATENSEC®

Presentation Off-white, film coated tablets engraved SEARLE 916. Each tablet contains Spironolactone BP 50 mg.

Uses Essential hypertension and hypertension associated with diabetes.

Dosage and administration *Adults:* Usual dose – 50–100 mg per day, which for difficult or severe cases may be gradually increased at two weekly intervals up to 200 mg/day.

Treatment should be continued for two weeks or longer since an adequate response may not occur before this time. Dosage should subsequently be adjusted according to the response of the patient.

Children: Initial daily dose should provide 3 mg of spironolactone per kilogram body weight, given in divided doses. Dosage should be adjusted on the basis of response and tolerance. If necessary a suspension may be prepared by crushing Diatensec tablets.

Contra-indications, warnings, etc Diatensec is contra-indicated in patients with anuria, acute renal insufficiency, rapidly progressing impairment of renal function, hyperkalaemia, and in patients who are hypersensitive to spironolactone. Diatensec should not be administered concurrently with other potassium-conserving diuretics as hyperkalaemia may be induced. For the same reason the use of potassium supplements in association with Diatensec therapy is also not recommended, except in cases of initial potassium depletion. If potassium supplementation is considered essential, serum electrolytes should be monitored.

Carcinogenicity: Spironolactone has been shown to produce tumours in rats when administered at high doses over a long period of time. The significance of these findings with respect to clinical use is not certain. However the long term use of spironolactone in young patients requires careful consideration of the benefits and the potential hazard involved.

Precautions: Patients receiving Diatensec therapy should be carefully evaluated for possible disturbances of fluid and electrolyte balance.

Hyperkalaemia may occur in patients with impaired renal function or excessive potassium intake and can cause cardiac irregularities which may be fatal. Should hyperkalaemia develop, Diatensec should be discontinued, and if necessary, active measures taken to reduce the serum potassium to normal.

Reversible increases in blood urea have been reported in association with Diatensec therapy, particularly in the presence of impaired renal function.

Dilutional hyponatraemia may be induced, especially when Diatensec is administered in combination with other diuretics.

Drug Interactions: Potentiation of the effect of other antihypertensive drugs occurs and their dosage may

need to be reduced by about 50% when Diatensec is added to the treatment regime, and then adjusted as necessary.

Pregnancy: Spironolactone or its metabolites may cross the placental barrier. The use of Diatensec in pregnant women requires that the anticipated benefit be weighed against the possible hazards to the mother and foetus.

Nursing mothers: Canrenone, a metabolite of spironolactone, appears in breast milk. If use of Diatensec is considered essential, an alternative method of infant feeding should be instituted.

Adverse effects: Gynaecomastia may develop in association with the use of spironolactone. Development appears to be related to both dosage level and duration of therapy and is normally reversible when Diatensec is discontinued. Other adverse reactions reported in association with spironolactone include: gastrointestinal intolerance, drowsiness, headache, mental confusion, skin rashes, menstrual irregularities, impotence and mild androgenic effects.

Overdosage: Acute overdosage may be manifested by drowsiness, mental confusion, nausea, vomiting, dizziness or diarrhoea. Hyponatraemia or hyperkalaemia may be induced but these effects are unlikely to be associated with acute overdosage. Symptoms of hyperkalaemia may manifest as paraesthesia, weakness, flaccid paralysis or muscle spasm and may be difficult to distinguish clinically from hypokalaemia. Electrocardiographic changes are the earliest specific signs of potassium disturbances. No specific antidote has been identified. Improvement may be expected after withdrawal of the drug. General supportive measures including replacement of fluids and electrolytes may be indicated. For hyperkalaemia, reduce potassium intake, administer potassium-excreting diuretics, intravenous glucose with regular insulin, or oral ion-exchange resins.

Further information Diatensec as a competitive aldosterone antagonist increases sodium excretion whilst reducing potassium loss at the distal renal tubule. It has a gradual and prolonged action, maximum response being usually attained after 2-3 days' treatment. Combination of Diatensec with a conventional, more proximally acting diuretic usually enhances diuresis without excessive potassium loss.

Product licence number 0020/0089.

DRAMAMINE*

Presentation Yellow, scored tablets engraved SEARLE on one side. Each tablet contains Dimenhydrinate BP 50 mg.

Uses Motion sickness. Vertigo, nausea and vomiting associated with Ménière's disease and other labyrinthine disorders.

Dosage and administration For prevention of motion sickness the first dose should be taken 30 minutes before the journey.

Adults and children over 12 years: 1-2 tablets two or three times daily.

Children: 1-6 years: $\frac{1}{4}$ - $\frac{1}{2}$ tablet two or three times daily
7-12 years: $\frac{1}{2}$ -1 tablet two or three times daily.

Contra-indications, warnings, etc Dramamine contra-indicated in patients with a hypersensitivity to dimenhydrinate, diphenhydramine and other antihistamines of similar chemical structure. May cause drowsiness. Patients affected in this way should not drive or operate machinery.

Precautions: Dramamine may mask ototoxic symptom associated with certain antibiotics.

Patients should be advised to avoid alcoholic drinks

Drug Interactions: In common with other antihistamines Dramamine may potentiate the sedative effects of CNS depressants including alcohol, barbiturates, narcotic analgesics, tranquillisers, and may enhance the effect of anticholinergics such as atropine and tricyclic antidepressants.

Pregnancy: The use of Dramamine in pregnant women requires that the benefits of therapy be weighed against the possible hazards to the mother and foetus.

Nursing mothers: Diphenhydramine, a metabolite of dimenhydrinate, has been detected in breast milk. The benefits of therapy should be weighed against the possible hazards to the child.

Adverse effects: Sedation is the most commonly reported. Gastrointestinal disturbances such as nausea and vomiting and atropine-like effects may be associated with antihistamines. Occasionally allergy and anaphylaxis have been reported.

Overdosage: The anticholinergic effects of antihistamines are most prominent in cases of mild poisoning with dryness of the mouth, headache, nausea, tachycardia and urinary retention. In massive overdosage the central effects of antihistamines may both stimulate and depress the nervous system. In infants and children symptoms of overdosage may include convulsion, hallucinations, excitement, incoordination, fixed dilated pupils, a flushed face and hyperthermia. Subsequent coma and respiratory depression may develop. Symptoms of stimulation may also arise in adults. Treatment should consist of gastric aspiration and lavage and supportive measures. Diazepam may be required for the treatment of convulsions.

Pharmaceutical precautions Dramamine may be powdered and dissolved in any acceptable aqueous fluid medium, provided that a concentration of 3 mg/ml is not exceeded. Above this concentration not all of the active constituent may dissolve.

Dramamine should be stored in a cool dry place.

Legal category P.

Package quantities Bottles containing 100 and 50 tablets.

Further information Nil.

Product licence number 0020/5011.

FEMULEN*

Presentation White tablets engraved SEARLE on both sides, containing Ethynodiol Diacetate BP 0.5 mg

Uses Oral contraception.

Dosage and administration Starting on the first day of menstruation, 1 tablet every day, without a break in

indication for as long as contraception is required. If Femulen is being taken for the first time, additional contraceptive precautions should be taken for the first 7 days of the first pack. Tablets should be taken at the same time each day.

Missed tablets: If the patient misses one tablet or takes later than the usual time, contraceptive efficacy may be reduced and additional contraceptive precautions (a condom or a cap plus spermicide) should be taken until the next period occurs. Patients who miss a single tablet should be instructed to take the missed tablet as soon as they remember, even though this may mean taking two tablets on one single day. The regular tablet for that day should be taken at the usual time. If two or more consecutive tablets are missed, Femulen should be discontinued and alternative contraceptive measures should be taken until menstruation occurs and the possibility of pregnancy is excluded.

Contra-indications, warnings, etc. The contra-indications for progestogen-only contraceptives are: known, suspected, or a past history of breast, genital or hormone dependent cancer; past or present, benign or malignant liver tumours; impaired liver function; active liver disease; disorders of lipid metabolism; undiagnosed abnormal vaginal bleeding or amenorrhoea; known or suspected pregnancy.

It has been established that the use of combined oestrogen/progestogen preparations is associated with an increase in the risk of thromboembolic and thrombotic disease. Although from these studies it has not yet been possible to evaluate the involvement of the progestogen component, it is at present required that the existence, a history of thrombophlebitis, thromboembolic disorders, cerebral vascular disease, myocardial infarction, coronary artery disease or a haemoglobinopathy be described as a contra-indication to Femulen, as it is to oestrogen-containing oral contraceptives.

Discontinue treatment if there is a gradual or sudden, partial or complete loss of vision or any evidence of ocular changes, onset or aggravation of migraine or development of headache of a new kind which is current, persistent or severe.

Patients with a history of jaundice during pregnancy have an increased risk of recurrence. Discontinue Femulen if jaundice occurs.

Progestogen-only oral contraceptives may offer less protection against ectopic pregnancy than against intra-uterine pregnancy.

Precautions: Patients receiving treatment with Femulen should be kept under regular medical surveillance.

Although it has not yet been possible to evaluate the involvement of the progestogen component of oral contraceptives and thromboembolic disorders, at present it is advisable to discontinue Femulen at least six weeks before elective surgery or during periods of prolonged immobilisation. It would be reasonable to resume Femulen two or three weeks after surgery provided the patient is ambulant. Every patient, however, should be considered individually with regard to the nature of the operation, the extent of immobilisation, the presence of additional risk factors and the chance of unwanted conception.

Caution should be exercised where there is the possibility of an interaction between a pre-existing disorder and a known or suspected side-effect. The use of Femulen in patients suffering from epilepsy, or with a history of migraine, or cardiac dysfunction may result in exacerbation of these disorders, because of fluid reten-

tion. Caution should also be observed in patients who wear contact lenses, patients with impaired carbohydrate tolerance, varicose veins, hypertension, asthma or any disease that is prone to worsen during pregnancy.

Vomiting or diarrhoea may reduce the effectiveness of the tablets, particularly if this should occur at or around the time of ovulation. If an episode of vomiting and/or diarrhoea occurs, additional contraceptive measures should be used until the next menstrual period occurs.

If a patient does not have a menstrual period within 45 days of her last menstrual period, the possibility of pregnancy should be investigated.

Drug interactions: Femulen may be rendered less effective and increased incidence of breakthrough bleeding may occur by virtue of drug interaction. At present, drugs suspected to interact in this way include barbiturates, anticonvulsants, antibiotics and antiarthritics. In common with oestrogen-containing oral contraceptives, Femulen may alter the metabolism of other drugs such as oral anticoagulants, anticonvulsants, tricyclic antidepressants, antihypertensive agents (e.g. guanethidine), vitamins and hypoglycaemic agents.

Nursing mothers: Available data suggest that progestogen-only oral contraceptives exert little effect on milk yield. Norethisterone, a metabolite of Femulen, has been detected in breast milk. In a study of infants breast fed by mothers taking Femulen, no adverse effects of the drug were observed.

Adverse effects: Patients taking progestogen-only oral contraceptives for the first time may initially experience menstrual irregularity. This may include amenorrhoea, prolonged bleeding and/or spotting and should decrease with time. Clinical investigations with Femulen indicate that side-effects are infrequent and tend to decrease as treatment continues. Known or suspected side-effects of progestogen-only oral contraceptives include nausea, vomiting, other gastrointestinal symptoms, certain skin disorders, chloasma, breast and weight changes, ocular changes, headache, migraine, depression, change in libido and appetite, increase in size of uterine myofibromata, and changes in carbohydrate, lipid, or vitamin metabolism. Tests of endocrine, hepatic and thyroid function, as well as coagulation tests, may be affected by this preparation.

The use of oral contraceptives has also been associated with a possible increased incidence of gall-bladder disease.

Benign hepatic adenomas, although rare, have been reported with long-term use of oral contraceptives.

Overdosage: Fatal overdosage has not been reported. Overdosage may be manifested by nausea, vomiting, breast engorgement and vaginal bleeding. Gastric lavage may not be necessary but demulcents such as milk, egg white or bismuth hydroxide may be helpful.

Pharmaceutical precautions Femulen should be stored in a cool dry place.

Legal category POM.

Package quantities Carton containing one strip of 28 tablets, with instructions.

Further information Femulen does not necessarily inhibit ovulation but it is believed to discourage implantation of the fertilised ovum by altering the endometrium. Cervical mucus viscosity is also changed which may render the passage of sperm less likely.

Product licence number 0020/0054.

GRAVIGARD® MINI-GRAVIGARD®

Presentation Two sizes of Gravigard intrauterine device are available:

Gravigard – Transverse arm 26 mm; vertical arm 36 mm.

Mini-Gravigard – Transverse arm 22 mm; vertical arm 28 mm.

Each device consists of pure electrolytic copper wire, surface area approximately 200 mm², wound onto the vertical arm of a plastic carrier which approximates the shape of the number 7. The plastic carrier is composed of polypropylene homopolymer impregnated with barium sulphate to render it radio-opaque, with a monofilament thread attached to the base of the vertical arm. Each device is presented partially loaded in its inserter tube and instructions for use are included with each sterile pack.

Uses Intrauterine contraception.

Dosage and administration Gravigard is recommended for women with a uterine size measurement from external os to fundus greater than 6.5 cm. Mini-Gravigard is recommended for women with a uterine size measurement from external os to fundus of 5.5 to 6.5 cm. Gravigard and Mini-Gravigard should be replaced every two years. The procedure for insertion is fully detailed in the instructions for use leaflet included with each sterile pack. Insertion is not recommended if uterine size from external os to fundus measures less than 5.5 cm.

Although IUCDs may be inserted at any time during the menstrual cycle, insertion during or shortly after the menstrual period reduces the possibility of an existing undiagnosed pregnancy. Postpartum insertion is usually delayed until involution of the uterus is complete. The benefits of immediate post abortion insertion should be weighed against the risks due to the relatively soft structure of the uterus.

Contra-indications, warnings, etc Contra-indications for IUCDs are pregnancy, history of ectopic pregnancy, postpartum endometritis or septic abortion within the past three months, abnormalities of the uterine cavity including developmental abnormalities, large or multiple fibroids, acute pelvic inflammatory disease or a history of repeated pelvic inflammatory disease, acute cervicitis, cervical dysplasia, endometrial disease such as hyperplasia or uterine polyps, suspected or proven malignancy of the genital organs, severe dysmenorrhoea, menorrhagia and/or intermenstrual bleeding. Contra-indicated in women with Wilson's disease or hypersensitivity to copper.

Medical diathermy to the abdominal and sacral regions is contra-indicated in Gravigard or Mini-Gravigard users because of the possibility of heat injury to the surrounding tissue.

An increased incidence of pelvic inflammatory disease and menorrhagia associated with the use of IUCDs has been reported. Pelvic infection may result in future infertility. Women with certain known or suspected heart diseases are more susceptible to development of sub-acute bacterial endocarditis. Appropriate precautions including administration of antibiotics should be observed when inserting an IUCD in such cases.

Syncope or bradycardia may occur in some women during insertion or removal of an IUCD.

Post-insertion cramps are usually of only a few minutes

duration, but some women experience cramps for several hours or days. Cramps may be associated with or increased menstrual flow, or increased menstrual bleeding or pain. Removal of the device may be required.

Gravigard or Mini-Gravigard may be inserted at any time during the menstrual cycle. In the event of partial expulsion or perforation of the uterine wall, the device should be removed. Infection, foreign body reaction, or perforation may result if an IUCD is inserted into the uterine cavity. Removal is advised if there is an infection resistant to treatment, or if there is significant anaemia, or

Precautions: A complete medical history including measurement of haemoglobin prior to insertion of the device and examination of the cervix and uterus should be examined within the first 12 months and annually thereafter.

After insertion the patient should be advised to ascertain the position of the retrieval thread. Advise the patient to report if pregnancy is suspected. Intrauterine devices should not be used in women with anaemia, a history of a previous pelvic infection of the uterus and those undergoing chemotherapy or having a coagulopathy.

The possibility of a patient suffering from a uterine infection at the time of insertion of an IUCD, should be considered.

Lost threads: If the retrieval thread is not visible at the cervix on follow-up, the device may be drawn up into the uterine cavity. If the device does not reappear during the next menstrual period, the device may usually be located by using a retrieval instrument. If it cannot be located, the device may have been expelled or may have been used to locate the cervix.

Pregnancy: The risk of a pregnancy occurring while using an IUCD is greater in women with a history of ectopic pregnancy than in those without. If a woman becomes pregnant while using an IUCD, the pregnancy should be carefully evaluated for complications.

There have been reports of a higher incidence of septic abortion in women using an IUCD in situ. Patients with an IUCD in situ should be closely monitored. If all abortion symptoms, fever, crampy discharge, as the onset of septic abortion may be rather than initial signs. The incidence of spontaneous abortion is increased over that in women not using contraception occurs with an IUCD.

If pregnancy occurs while using an IUCD, the thread is visible then the device should be removed. If the thread is not visible, the IUCD may go to term or until a miscarriage occurs. If the patient is pregnant, careful observation of the effects of intrauterine contraception should be reported.

Adverse effects: Uterine infection, discharge, embedment, perforation, and expulsion have been reported.

Pharmaceutical precautions Gravigard and Minigravigard are supplied in sterile packs which should not be opened until required for insertion. Each device should be handled with aseptic precautions and should be left folded in its inserter tube for more than two minutes, as this may prevent the transverse arm from assuming its correct position. Care should be taken not to damage the sterile packaging which should be stored in a cool dry place.

Legal category POM.

Package quantities *Gravigard*: Pack containing one sterile device.

Minigravigard containing five packs.

ii-Gravigard: Pack containing one sterile device. *Minigravigard* containing five packs.

Other information The average amount of copper released from copper IUCDs is well below the daily dietary intake of copper. Small increases of endometrial copper levels have been noted in the presence of copper IUCDs, these are not cumulative. No changes in blood levels of copper have been detected.

Gravigard 0020/0062

ii-Gravigard 0020/0085

MOTIL* TABLETS
MOTIL* LIQUID

Presentation *Lomotil Tablets*: White tablets engraved with 'MOTIL' on one side. Each tablet contains Diphenoxylate Hydrochloride BP 2.5 mg with Atropine Sulphate PhEur 0.025 mg.

Lomotil Liquid: Red, cherry flavoured liquid. Each 5 ml measure contains Diphenoxylate Hydrochloride BP 2.5 mg with Atropine Sulphate PhEur 0.025 mg.

Uses Acute and chronic diarrhoea.

Contraindications Control of stool formation after colostomy or ileostomy.

Safe and administration *Caution*: Lomotil should not be given to children under one year. The recommended dosage should not be exceeded.

Adults: The recommended starting dose is four tablets, four 5 ml measures, followed by two tablets or two 5 ml measures every six hours. Once satisfactory control is achieved, dosage should be reduced to suit the requirements of the individual patient.

Children: Recommended dosage guide:

–3 years: 1 tablet or one 5 ml measure twice daily.

–8 years: 1 tablet or one 5 ml measure three times daily.

–12 years: 1 tablet or one 5 ml measure four times daily.

–3–16 years: 2 tablets or two 5 ml measures three times daily.

Once satisfactory control is achieved, dosage should be reduced to suit the requirements of the individual patient.

Contra-indications, warnings, etc Lomotil is contraindicated in children under one year, in patients with known hypersensitivity to diphenoxylate hydrochloride or atropine, in patients with jaundice or intestinal obstruction, and in the treatment of diarrhoea associated with pseudomembranous enterocolitis.

Lomotil should be used with special caution in young

children because of the variability of response in this age group. Appropriate fluid and electrolyte therapy should also be given to protect against dehydration. If severe dehydration or electrolyte imbalance is present, Lomotil should be withheld until appropriate corrective therapy has been initiated.

In some patients with acute ulcerative colitis, agents which inhibit intestinal motility or delay intestinal transit time have been reported to induce toxic megacolon. Patients with acute ulcerative colitis should be carefully observed and Lomotil therapy should be discontinued promptly if abdominal distension or other untoward symptoms develop.

Lomotil should be used with caution in patients with liver disease, since hepatic coma may be precipitated.

Precautions: Because a subtherapeutic dose of atropine is added to Lomotil, atropinic effects may occur.

Drug interactions: Since the chemical structure of diphenoxylate hydrochloride resembles that of meperidine hydrochloride, concurrent use with MAO inhibitors could precipitate hypertensive crisis. Close observation is required when these medications are given concomitantly with diphenoxylate hydrochloride.

Diphenoxylate hydrochloride may potentiate the action of barbiturates, tranquillisers and alcohol.

Pregnancy: The safety of Lomotil in pregnancy has not been established. Animal teratology and reproduction studies have demonstrated no adverse effects. The benefits of therapy must be weighed against the possible hazards to the mother and foetus.

Nursing mothers: Diphenoxylate hydrochloride and atropine sulphate may be excreted in human milk. If a nursing mother is taking Lomotil, the infant may exhibit some effects of the drug.

Adverse effects: Atropine effects, such as dryness of the skin and mucous membrane, tachycardia, hyperthermia and urinary retention may occur, especially in children. Other adverse reactions are uncommon but may include gastrointestinal intolerance, sedation, headache, dizziness, paralytic ileus, toxic megacolon, angioneurotic oedema, restlessness, depression and cutaneous reactions.

Overdosage: Accidental overdosage may produce narcosis with respiratory depression or atropine poisoning or both, particularly in children. Symptoms of overdosage include dryness of the skin and mucous membranes, flushing, hyperthermia and tachycardia, nystagmus, pinpoint pupils and severe respiratory depression. Since the onset of symptoms of overdosage may be considerably delayed and respiratory depression may not become evident until 12 to 30 hours after ingestion, gastric lavage and continuous observation for at least 48 hours are recommended.

If respiratory depression develops, naloxone, a specific antidote, should be administered. The duration of action of naloxone hydrochloride is considerably shorter than that of diphenoxylate hydrochloride, and repeated injections of the antidote may be required. Establishment of a patent airway and artificial ventilation may be needed.

Pharmaceutical precautions Lomotil should be stored in a cool dry place.

Legal category POM.

Package quantities *Lomotil tablets*: Pack of 100 consisting of 5 blister strips, each containing 20 tablets. *Bottles* containing 500 and 1,000 tablets.

Lomotil liquid: Bottles containing 60 ml (with 5 ml measure) and 500 ml.

Further information Nil.

Product licence numbers

Lomotil Tablets 0020/5014

Lomotil Liquid 0020/5015

LOTUSSIN*

Presentation Pale amber, peach flavoured linctus containing Diphenhydramine Hydrochloride BP 10 mg, Dextromethorphan Hydrobromide BP 12.5 mg, Ephedrine Hydrochloride PhEur 15 mg and Guaiphenesin BP 100 mg in each 10 ml.

Uses Cough suppression and nasal or bronchial mucosal decongestion.

Dosage and administration *Adults and children over 12 years:* 10 ml three times daily.

Children: 1–5 years: 2.5 ml to 5 ml three times daily.

6–12 years: 5 ml to 10 ml three times daily.

Contra-indications, warnings, etc Lotussin is contra-indicated in patients with a known hypersensitivity to any of the active constituents, in patients with heart disease including coronary artery disease, hypertension, thyrotoxicosis and in patients receiving monoamine oxidase inhibitor therapy or within 14 days of stopping such treatment.

Lotussin should not be given to children under one year old.

May cause drowsiness. Patients affected in this way should not drive or operate machinery.

Precautions: Use with caution in patients with peripheral vascular disease, bronchial asthma, prostatic enlargement or glaucoma.

When prescribing Lotussin for patients with diabetes mellitus the sucrose content of 6.55 g per 10 ml should be considered.

Drug interactions: Concurrent use of Lotussin with monoamine oxidase inhibitors may precipitate a hypertensive crisis. Lotussin therefore should not be used in a patient receiving MAO inhibitors or within 14 days of stopping such treatment.

Lotussin may potentiate the effect of other drugs acting on the central nervous system such as hypnotics, sedatives and tranquillisers and patients should avoid alcoholic drink during treatment.

The possibility of interaction with other medication should be considered by reference to each active ingredient.

Pregnancy: The safety of Lotussin in pregnancy has not been established. The benefits of therapy must be weighed against the possible hazards to the mother and foetus.

Nursing mothers: Diphenhydramine is, and other constituents of Lotussin may be, excreted in human milk. The benefits of therapy must be weighed against possible hazards to the mother and child.

Adverse effects: Drowsiness may be experienced by some patients. One case of skin rash has been reported.

Overdosage: Treatment of overdosage consists of gastric lavage in the conscious patient and intensive supportive therapy where necessary.

Pharmaceutical precautions Lotussin should be stored in a cool dry place. Recommended diluent – w required for paediatric usage – Syrup BP. When diluted use within 14 days of preparation.

Legal category P.

Package quantities Bottles of 100 ml and 1 litre.

Further information Nil.

Product licence number 0020/0077.

NOVAGARD*

Presentation Novagard is an intrauterine device consisting of pure copper wire with a silver core, surface area approximately 200 mm², wound on to the vertical arm of a T-shaped plastic carrier. The plastic carrier is composed of polyethylene impregnated with bar sulphate, to render it radio-opaque, with a polyethylene thread attached to the base of the vertical arm. The device is presented partially loaded in its insertor and instructions for use are included with each sterile pack.

Novagard dimensions: Transverse arms 32 mm
Vertical arm 32 mm

Uses Intrauterine contraception.

Dosage and administration Novagard is recommended for women with a uterine size measured from external os to fundus greater than 5.5 cm. Novagard should be replaced every four years. The procedure for insertion is fully detailed in the instructions for use leaflet included with each sterile pack.

Although IUCDs may be inserted at any time during the menstrual cycle, insertion during or shortly after menstrual period reduces the possibility of an existing undiagnosed pregnancy. Postpartum insertion is usually delayed until involution of the uterus is complete. The benefits of immediate post abortion insertion should be weighed against the risks due to the relatively simple structure of the uterus.

Contra-indications, warnings, etc Contra-indications are pregnancy, history of ectopic pregnancy, postpartum endometritis or septic abortion within past three months, abnormalities of the uterine cavity including developmental abnormalities, large or multiple fibroids, acute pelvic inflammatory disease or a history of repeated pelvic inflammatory disease, acute cervicitis, cervical dysplasia, endometrial disease such as hyperplasia or uterine polyps, suspected or proven malignancy of the genital organs, severe dysmenorrhoea, menorrhagia and/or intermenstrual bleeding. Contra-indicated in women with Wilson's disease or hypersensitivity to copper.

Medical diathermy to the abdominal and sacral region is contra-indicated in Novagard users because of the possibility of heat injury to the surrounding tissue.

An increased incidence of pelvic inflammatory disease and menorrhagia associated with the use of IUCDs has been reported. Pelvic infection may result in future infertility. Women with certain known or suspected diseases are more susceptible to development of severe acute bacterial endocarditis. Appropriate precautions including administration of antibiotics should be observed when inserting an IUCD in such cases.

Syncope or bradycardia may occur in some women.

ring insertion or removal of an IUCD. Post-insertion cramps are usually of only a few minutes duration, but some women may experience cramps for several hours days. Spotting, intermenstrual bleeding or increased menstrual flow may occur. If heavy or persistent bleeding or persistent cramping occur, removal of the device may be indicated.

Novagard should be removed in the event of partial expulsion and a new device inserted. If perforation of the uterus or cervix is suspected, the device should be removed as soon as medically feasible. Adhesions, foreign body reactions and intestinal obstruction may result if an IUCD is left within the peritoneal cavity. Removal is also indicated in cases of pelvic infection resistant to treatment, menorrhagia producing significant anaemia, or intractable pain.

Precautions: A complete gynaecological examination, including measurement of the uterus, should precede insertion of the device. Ideally the patient should be re-examined within the first three months after insertion and annually thereafter. After insertion the patient should be taught to examine herself to ascertain the continued presence of the retrieval threads. Advise the patient to consult her doctor if pregnancy is suspected.

Intrauterine devices should be used with caution in women with anaemia, menorrhagia, hypermenorrhoea, history of a previous uterine incision or perforation of the uterus and those receiving anticoagulants, steroid therapy or having a coagulopathy.

The possibility of a seizure being precipitated in a patient suffering from epilepsy, at or shortly after the insertion of an IUCD, should also be borne in mind.

Retrieval threads: If the retrieval threads are not visible at the review on follow-up examination, they may have been drawn up into the uterus or cervical canal and may appear during the next menstrual period. The threads may usually be located by gently probing with a suitable instrument. If they cannot be found, they may have broken off, or the device may have been expelled. Ultrasound or X-ray may be used to locate the device.

Pregnancy: The risk of ectopic pregnancy is reported to be greater in women who conceive with an IUCD in situ than in those without an IUCD. Therefore, if a patient becomes pregnant with an IUCD in situ, she should be carefully evaluated for possible ectopic pregnancy.

There have been reports of an increased incidence of ectopic abortion in women who become pregnant with an IUCD in situ. Patients who are pregnant with an IUCD in situ should be closely observed and told to report immediately all abnormal symptoms such as 'flu-like' symptoms, fever, cramping pain, bleeding or excessive discharge, as the onset of septicaemia associated with ectopic abortion may be insidious with general symptoms rather than initial signs of spontaneous abortion. Also, the incidence of spontaneous abortion appears to be increased over that in unprotected women when conception occurs with an IUCD in situ.

If pregnancy occurs with an IUCD in situ and the threads are visible then the device should be removed. If the threads are not visible or device removal would be difficult, the IUCD may be left in situ until the pregnancy goes to term or until a decision is made to terminate the pregnancy. If the patient elects to continue the pregnancy, careful observation is required. The long term effects of intrauterine copper on the foetus are unknown.

Adverse effects: Uterine or cervical perforation, vaginal discharge, embedment and allergic reactions have been reported with copper IUCD's.

Pharmaceutical precautions Novagard is supplied in a sterile pack which should not be opened until required for insertion. Each device should be handled with aseptic precautions and it is advisable that the folded device in the inserter tube should not be left for more than two minutes, as this may prevent the transverse arms from reassuming the correct position.

Care should be taken not to damage the sterile package which should be stored in a cool dry place.

Legal category POM.

Package quantities Pack containing one sterile device.

Outer containing five packs of one sterile device.

Outer containing ten sterile devices.

Further information The average amount of copper eluted from copper IUCDs is well below the daily dietary intake of copper. Small increases of endometrial copper levels have been noted in the presence of copper IUCDs, but these are not cumulative. No changes in blood levels of copper have been detected.

Product licence number 0022/0046.

The product licence is held by KabiVitrum.

OVULEN* 50

Presentation White tablets engraved SEARLE 163 on both sides, containing Ethynodiol Diacetate BP 1 mg and Ethinyloestradiol PhEur 0.05 mg.

Uses Oral contraception.

Dosage and administration One tablet daily for 21 days, starting on Day 5 of the menstrual cycle (where Day 1 is the first day of bleeding). The next course of tablets should be started after seven tablet-free days. This 'three weeks on, one week off' regimen is continued for as long as contraception is required. Patients should be advised to use an additional form of contraception for the first 14 days of the first pack.

Missed tablets: Patients who miss a single tablet should be instructed to take the missed tablet as soon as they remember, even though this may mean taking 2 tablets on one single day. The regular tablet for that day should be taken at the usual time. An additional method of contraception (a sheath or a cap plus spermicide) should be used for the remainder of the cycle. If two consecutive tablets are missed patients should be instructed to take 2 tablets each day for the next two days and use an additional method of contraception for the rest of the cycle. Those who miss more than 2 tablets should resume as soon as they remember, ignoring those they have missed, and should use additional contraceptive precautions for the rest of the cycle.

Contra-indications, warnings, etc The contra-indications for combined oral contraceptives are thrombophlebitis, thromboembolic disorders, cerebral vascular disease, myocardial infarction, coronary artery disease, or a past history of these conditions; known, suspected or a past history of breast, genital or hormone dependent cancer; past or present, benign or malignant liver tumours; impaired liver function; active liver disease; disorders of lipid metabolism; haemoglobinopathies; undiagnosed abnormal vaginal bleeding or amenorrhoea; known or suspected pregnancy.

It has been established that the use of combined oral

contraceptives is associated with an increase in the risk of thromboembolic and thrombotic disease.

Recent studies have indicated that combined oral contraceptives may be associated with an increased risk of myocardial infarction. The risk of arterial thrombosis associated with combined oral contraceptives increases with age, and this risk is aggravated by cigarette smoking. The use of combined oral contraceptives by women in the older age group, especially those who are cigarette smokers, should therefore be discouraged, and alternative methods advised.

Ovulen 50 should be discontinued at least six weeks before elective surgery or during periods of prolonged immobilisation. It would be reasonable to resume oral contraceptives two or three weeks after surgery provided the patient is ambulant. Every patient, however, should be considered individually with regard to the nature of the operation, the extent of immobilisation, the presence of additional risk factors and the chance of unwanted conception.

Discontinue treatment if there is a gradual or sudden, partial or complete loss of vision or any evidence of ocular changes, onset or aggravation of migraine or development of headache of a new kind which is recurrent, persistent or severe.

Patients with a history of jaundice during pregnancy have an increased risk of recurrence. Discontinue Ovulen 50 if jaundice occurs.

Precautions: Patients receiving treatment with oestrogen or progestogen or both, should be kept under regular surveillance.

Caution should be exercised where there is the possibility of an interaction between a pre-existing disorder and a known or suspected side-effect. The use of Ovulen 50 in patients suffering from epilepsy, or with a history of migraine, or cardiac dysfunction may result in exacerbation of these disorders, because of fluid retention. Caution should also be observed in patients who wear contact lenses, patients with impaired carbohydrate tolerance, hypertension, asthma, varicose veins, or any disease that is prone to worsen during pregnancy, and in young patients in whom the growth period has not yet ended.

Vomiting or diarrhoea may reduce the effectiveness of the tablets, particularly if this should occur at or around the time of ovulation.

Drug interactions: Ovulen 50 may be rendered less effective and increased incidence of breakthrough bleeding may occur by virtue of drug interaction with rifampicin, isoniazid, ampicillin, neomycin, penicillin V, chloramphenicol, sulphonamides, nitrofurantoin, barbiturates, phenytoin, primidone, anti-arthritis, analgesics, tranquilisers and anti-migraine preparations. Ovulen 50 may alter the effectiveness of other types of drugs, such as oral anticoagulants, anticonvulsants, tricyclic antidepressants, antihypertensive agents (e.g. guanethidine), vitamins and hypoglycaemic agents. Therefore, the possibility of a drug interaction occurring in patients on any of these therapeutic agents should be considered when prescribing Ovulen 50.

Nursing mothers: Active ingredients of oral contraceptives have been detected in the milk of mothers taking such drugs. The effect of Ovulen 50 on breast-fed infants has not been determined.

Adverse effects: Known or suspected side-effects of oral contraceptives include nausea, vomiting, other gastrointestinal symptoms, irregular vaginal bleeding, amenorrhoea, certain skin disorders, chloasma, breast and

weight changes, ocular changes, headache, hypertension, migraine, depression, change in libido and appetite, increase in the size of uterine myofibromata, fluid retention, infertility after discontinuation, and change in carbohydrate, lipid and vitamin metabolism.

Tests of endocrine, hepatic and thyroid function, well as coagulation tests, may be affected by the preparation.

The use of oral contraceptives has also been associated with a possible increased incidence of gall-bladder disease.

Benign hepatic adenomas, although rare, have been reported with long-term use of oral contraceptives.

Overdosage: Fatal overdosage has not been reported. Overdosage may be manifested by nausea, vomiting, breast engorgement and vaginal bleeding. Gastric lavage may not be necessary but demulcents such as milk, or white or bismuth hydroxide may be helpful.

Pharmaceutical precautions Ovulen 50 should be stored in a cool dry place.

Legal category POM.

Package quantities Carton containing one strip of 7 tablets, with instructions.

Further information Ovulen 50 provides oral contraception at a dosage level acceptable to many women. Patients switching from another oral contraceptive should start Ovulen 50 seven days after finishing the current pack.

Product licence number 0020/5023.

PRO-BANTHINE[®]

Presentation Pink, sugar coated, biconvex tablets printed SEARLE on one side. Each tablet contains Propantheline Bromide BP 15 mg.

Uses *Gastrointestinal:* Peptic ulcer, acute pancreatitis. *Genitourinary:* Enuresis.

Miscellaneous: Diagnostic radiological procedure hyperhidrosis.

Dosage and administration *Caution:* Food has been reported to reduce the bioavailability of Pro-Banthine. Tablets should be taken at least one hour before meals.

Adults: **Peptic ulcer:** The recommended initial starting dose is one tablet before each meal, and two tablets bedtime. Subsequently, dosage should be adjusted according to the patient's individual response and tolerance.

Diagnostic radiological procedures: Two tablets should be given 45 minutes prior to the diagnostic procedure.

Other indications: A dosage of up to eight tablets daily may be required.

Children: For enuresis the usual dosage is one to three tablets taken at bedtime. Although clinical trials using Pro-Banthine tablets for other indications have not been conducted in children, as a guide the total daily dosage should not exceed 2 mg per kilogram body weight, and should be given in divided doses.

Contra-indications, warnings, etc Pro-Banthine is contra-indicated in patients with obstructive diseases of the gastrointestinal or urinary tract, pyloric stenosis, intestinal atony, severe ulcerative colitis or toxic megacolon, hiatus hernia associated with reflux oesophagitis

able cardiovascular adjustment in acute haemorrhage, myasthenia gravis, glaucoma and in patients who are hypersensitive to propantheline bromide.

Some patients, especially those with ileostomy or stoma, diarrhoea may be a symptom of incomplete intestinal obstruction. Pro-Banthine therapy should be used in such patients.

Patients with severe heart disease in whom an increase in heart rate is undesirable should be observed closely if Pro-Banthine is administered.

Pro-Banthine may produce drowsiness or blurred vision. Patients should not drive or operate machinery if affected in this way.

Precautions: Patients with prostatic hypertrophy may experience some urinary hesitancy. This may be minimised if such patients are advised to micturate at the time the medication is taken.

Patients with ulcerative colitis should be treated with caution, since Pro-Banthine may suppress intestinal motility to the point of producing paralytic ileus, thus precipitating or aggravating toxic megacolon.

Pro-Banthine should be used with caution in the elderly and in all patients with autonomic neuropathy, atonic renal disease, hyperthyroidism, coronary heart disease, congestive heart failure, cardiac arrhythmias or hypertension.

Drug interactions: Concurrent use of Pro-Banthine with slow-dissolving tablets of digoxin may cause increased serum digoxin levels.

Anticholinergics may alter absorption of other medication given concomitantly.

Excessive cholinergic blockade may occur if Pro-Banthine is given concomitantly with belladonna alkaloids or synthetic and semisynthetic anticholinergic agents.

Pregnancy: Animal reproduction and teratology studies have not been performed. The use of Pro-Banthine in pregnant women requires that the anticipated benefit be weighed against the possible hazards to mother and fetus.

Lactating mothers: Whether propantheline bromide is excreted in human breast milk is unknown. No animal studies have been conducted. If use of the drug is considered essential the anticipated benefit should be weighed against the possible hazards to mother and child.

Adverse effects: Varying degrees of drying of salivary secretion may occur, as well as mydriasis, blurred vision and heat stroke. Other adverse reactions reported include: nervousness, drowsiness, dizziness, insomnia, headache, tachycardia, loss of the sense of taste, nausea, vomiting, constipation, urinary hesitancy and retention, incontinence, allergic dermatitis and anaphylaxis.

Overdosage: Intensification of the usual side effects may occur. Severe intoxication may result in disturbances of the central nervous system (from restlessness and excitement to psychotic behaviour), circulatory changes (shaking, fall in blood pressure, circulatory failure), respiratory failure, paralysis and coma.

In the event of overdosage, empty the stomach by vomiting or lavage. Physostigmine salicylate 0.5 to 1 mg should be injected intravenously to control the central and peripheral effects of propantheline bromide. Since it has a brief duration of action of about 1 to 2 hours, it may be necessary to repeat injections up to a total dose of 5 mg.

Excitement may be controlled by small doses of a

short-acting barbiturate such as thiopentone sodium 100 mg.

Supportive therapy may require oxygen and assisted respiration, ice bags or alcohol sponges for hyperpyrexia, especially in children, bladder catheterisation and the administration of fluids.

Pharmaceutical precautions Pro-Banthine tablets should be stored in a cool dry place.

Legal category POM.

Package quantities Bottles containing 100 and 1,000 tablets.

Further information Propantheline bromide is extensively metabolised in man. Some enzymic hydrolysis of the drug may occur in the gastrointestinal tract prior to its absorption.

Studies in healthy men demonstrated that peak plasma levels of unchanged drug were reached within 2 hours of a single, oral dose of propantheline bromide. Following single oral dosing the plasma elimination half-life was about 2–3 hours and some 1–10% of propantheline bromide was excreted in urine as unchanged drug.

In healthy men studies have shown onset of anticholinergic effects within 1 hour of oral administration. Effects persisted for up to 6 hours after oral dosing.

Product licence number 0020/5026

REGULAN®

Presentation Premeasured, single-dose sachet containing 6.4 g of beige rough ground powder. Active Ingredient – 3.6 g Ispaghula Husk BP.

Uses For the treatment of constipation and patients requiring a high fibre regimen.

Dosage and administration

1. Pour measured dosage into a glass.
2. Slowly add 150 ml ($\frac{1}{4}$ pint) cool water.
3. Drink entire contents immediately. An additional glass of liquid may be taken if needed.

Adults and Children over 12 years: The usual dosage is the entire contents of one sachet taken one to three times daily.

Children: A reduced dosage based upon the age of the child should be given.

6–12 years: $\frac{1}{2}$ –1 level 5 ml teaspoonful one to three times daily.

Contra-indications, warnings, etc Regulan should not be given to patients with intestinal obstruction, faecal impaction or hypersensitivity to ispaghula.

Regulan should always be taken as a liquid suspension and should be drunk immediately after mixing.

Precautions: It may be advisable to supervise treatment in the elderly or debilitated and patients with intestinal narrowing or decreased motility, as rare instances of gastrointestinal obstruction have been reported with mucilloid preparations when taken with insufficient liquid, contrary to the administration instructions.

The sucrose content of each 6.4 g dose has a calorific value of approximately 3.5 kilocalories, this should be considered when taken by diabetics.

Pregnancy and Lactation: The benefits of therapy should be weighed against any possible hazards if used during pregnancy and lactation.

Adverse effects: Allergy, gastrointestinal obstruction or impaction have been reported with hydrophilic mucilloid preparations.

Overdosage: No instances of true overdosage have been reported. If overdosage should occur there is no specific treatment and symptomatic measures should be employed.

Pharmaceutical precautions Store in a cool dry place.

Legal category GSL.

Package quantities Box of 30 and 90 sachets.

Further information Regular is gluten-free.

Product licence number 0020/0087.

SERENACE* AMPOULES

SERENACE* TABLETS

SERENACE* LIQUID

SERENACE* CAPSULES

Presentation *Serenace 5 mg and 20 mg Ampoules:* Clear glass ampoules containing Haloperidol BP 5 mg in 1 ml aqueous solution.

Clear glass ampoules containing Haloperidol BP 20 mg in 2 ml aqueous solution.

Serenace 1.5 mg; 5 mg; 10 mg and 20 mg Tablets: White, biconvex, scored tablets engraved SEARLE 41 on one side, containing Haloperidol BP 1.5 mg.

Bright pink, biconvex, scored tablets engraved SEARLE 12 on one side, containing Haloperidol BP 5 mg.

Pale pink, biconvex, scored tablets engraved SEARLE 919 on one side, containing Haloperidol BP 10 mg.

Dark pink, biconvex, scored tablets engraved SEARLE 920 on one side, containing Haloperidol BP 20 mg.

Serenace Liquid: Clear, odourless, colourless liquid containing Haloperidol BP 2 mg per ml.

Serenace Capsules: Two-tone green capsules printed SEARLE on both halves, containing Haloperidol BP 0.5 mg.

Uses Mania and hypomania, acute and chronic schizophrenia, acute psychotic agitation, organic psychoses, Gilles de la Tourette syndrome, childhood behaviour disorders, anxiety neurosis, tension states, psychosomatic conditions associated with anxiety, anxiety associated with depression.

Dosage and administration Daily dosage may range between 1 mg to 200 mg dependent on the patient's condition and the individual's response to treatment. As with all neuroleptic drugs, the dose of haloperidol should be titrated to the needs of each patient. Oral dosage may be given in single or divided doses.

Adults: The maximum and maintenance dose will generally be lower for debilitated or geriatric patients who may be more sensitive to Serenace.

Oral administration: Usually treatment may be started at 10–15 mg daily and progressively increased until satisfactory control is achieved. When maximum improvement is reached the dosage should be gradually reduced to the lowest effective maintenance dose which, for many patients, will be 5–10 mg per day.

Parenteral administration: For rapid emergency control, up to 30 mg may be given by intramuscular injection. A dose of 10 mg will usually be adequate. Further doses

may be repeated six-hourly until control is achieved when oral dosage may be substituted in diminishing doses.

Serenace injection may also be administered by intravenous route.

Anxiety states: Usual adult dosage, 0.5 mg (one capsule) twice daily.

Children: *Oral administration:* Usual maintenance dose 0.05 mg per kg body weight per day. Where control is not urgent treatment may be initiated at 0.025 mg/kg body weight per day and gradually increased to usual maintenance level. Therapy may be initiated at or three times the maintenance dosage, together with antiparkinsonian drugs if required.

Parenteral administration: Not recommended.

Contra-indications, warnings, etc Contra-indicated for comatose patients and for those with Parkinson's disease or a sensitivity to haloperidol.

May cause drowsiness or affect mental concentration. Patients affected in this way should not drive or operate machinery.

Precautions: May be given to epileptics, but with anticonvulsant therapy should be continued.

Administer with care to patients with severe cardiovascular disorders, because of the possibility of transient hypotension. Should hypotension occur and a vasopressor be required, adrenaline should not be used as haloperidol may block its vasopressor activity and paradoxical further lowering of the blood pressure may occur.

Use cautiously in thyrotoxic patients and those with arteriosclerosis who may have occult or manifest lesions of the basal ganglia. Such patients may be more prone to develop extrapyramidal symptoms.

In common with other tranquilisers, Serenace should not be used alone where psychotic depression predominates, but may be combined with antidepressants where there is associated anxiety.

Drug Interactions: Serenace may potentiate the action of other CNS depressants, including alcohol.

Enhanced CNS effects (sedation, mental disturbances) have been reported with the combined use of methyldopa and haloperidol.

Severe neuromuscular symptoms with impairment of consciousness and fever have been reported with combined use of lithium and haloperidol. A causal relationship has not been established; however, patients receiving such combined therapy should be carefully observed for early evidence of neurological toxicity and treatment should be discontinued if such signs appear.

Pregnancy: The safety of Serenace in pregnancy has not been established.

Reproduction studies in rodents have shown increased incidence of resorption, reduced fertility and pup mortality. No specific teratogenic effect has been reported in rats, rabbits or dogs but cleft palate and eye syndrome have been observed in mice.

No well controlled studies of haloperidol use in pregnant women have been conducted. Two cases of foetal limb malformation have been reported following maternal use of haloperidol combined with other drugs during the first trimester. No causal relationship has been established. Use of Serenace during pregnancy requires that the anticipated benefit be weighed against possible hazards to mother and foetus.

Nursing mothers: Haloperidol has been detected

ast milk. If use of Serenace is considered essential, an alternative method of infant feeding should be instituted.

Adverse effects: Extrapyramidal symptoms such as parkinson-like symptoms, akinesia, akathisia, dyskinesia, dystonia may develop during Serenace treatment. Very rarely dystonia has been reported to produce laryngeal/pharyngeal spasm associated with gagging, stridor, respiratory distress and asphyxia. Such symptoms may be promptly controlled by parenteral administration of a short-acting barbiturate, an antihistamine or an antiparkinsonian drug. The occurrence and severity of most extrapyramidal symptoms are generally, but not always, dose related. Extrapyramidal reactions have occasionally been reported during treatment at relatively low dose levels in both children and adults. Administration of antiparkinsonian drugs may be required for control of such reactions.

It is common with certain other antipsychotic agents that haloperidol has been associated with persistent tardive dyskinesia. Tardive dyskinesia may develop in some patients on long-term therapy or may develop after drug therapy has been discontinued. The risk is reported to be greater in elderly patients on high-dose therapy. Characteristic symptoms are rhythmical involuntary movements of the tongue, face, mouth or jaw sometimes accompanied by involuntary movements of the extremities. They may persist for many months or even years and, while they gradually disappear in some patients, they may appear to be permanent in others. Gradual reduction of dosage to reveal persisting dyskinesia has been suggested, so that treatment may be stopped if necessary. Antiparkinsonian agents have proved of little value in this syndrome.

Other adverse reactions reported include insomnia, depression, drowsiness, blurred vision, hypotension and gastrointestinal effects. Impairment of liver function, cardiac arrhythmias, blood dyscrasias, skin reactions including photosensitisation are rarely reported as are severe reactions related to endocrine effects.

Overdosage: Intensification of the known pharmacological and adverse effects may occur. The most prominent could be severe extrapyramidal symptoms, hypotension and sedation. The patient may appear comatose with respiratory depression and hypotension which could be severe enough to produce a shock-like state. Extrapyramidal reactions may include muscular weakness or rigidity and a generalised or localised tremor. With accidental overdosage hypothermia, bradycardia, sinus bradycardia and hypertension have been reported in young children.

No specific antidote has been identified.

In the event of overdosage the stomach should be emptied by aspiration and lavage. Emetics should not be used. Establishment of a patent airway and artificial ventilation may be needed. Hypotension may be counteracted by placing the patient in the head-down position and by use of a plasma expander and careful use of a vasopressor agent such as noradrenaline. Adrenaline

should not be used. Severe extrapyramidal reactions should be treated with parenteral antihistamines or antiparkinsonian drugs. The relatively long plasma elimination half-life of haloperidol should be considered.

Pharmaceutical precautions Serenace Ampoules should be stored in a cool place and protected from light.

Serenace Tablets and Capsules should be stored in a cool, dry place.

Serenace Liquid should be stored in a cool place.

Dilution: Serenace liquid may be diluted 50% with either distilled water or Syrup BP. The diluted solution should be stored in amber bottles and is stable for 8 weeks at room temperature.

Legal category POM.

Package quantities 5 mg Ampoules: Boxes of 6.

20 mg Ampoules: Boxes of 10.

1.5 mg Tablets: Bottles of 50, 250 and 1,000.

5 mg Tablets: Bottles of 50, 250 and 1,000.

10 mg Tablets: Bottles of 50, 250 and 1,000.

20 mg Tablets: Bottles of 50 and 250.

2 mg/ml Liquid: Bottles of 100 ml and 500 ml.

0.5 mg Capsules: Bottles of 50, 250 and 1,000.

Further information The pharmacokinetics of haloperidol have been studied in healthy volunteers and patients. In volunteers, following a single intravenous or oral dose, serum elimination half-life ranged from 10 to 19 hours and 12 to 38 hours respectively. Similar elimination half-lives were observed in patients after administration of a single oral or intramuscular dose of the drug or after withdrawal of the drug from patients who were in a steady-state. Steady-state serum levels were usually achieved within 6 days on a fixed oral dosage.

Haloperidol serum concentrations were in the range 0.5–10 ng/ml in patients at steady-state. The free fraction of haloperidol was generally about 8% of the total serum concentration, although some patients showed considerable deviation from this value. A number of other psycho-active drugs caused no measurable interference with the protein binding of haloperidol. The compound was found to be extensively metabolised in man and very little unchanged haloperidol was excreted in urine.

DIAMICRON* ▼

Presentation *Diamicon tablets*: White, circular tablets with a cross scoring on one side each containing 80 mg gliclazide. Gliclazide is 1-(3-azabicyclo (3,3,0) oct-3-yl)-3-(p-tolylsulphonyl) urea.

Pharmacology Gliclazide is a hypoglycaemic sulphonylurea differing from other related compounds by the addition of an azabicyclo octane ring. The drug is well absorbed and its half-life in man is approximately 10–12 hours. Gliclazide is metabolised in the liver; less than 5% of the dose is excreted unchanged in the urine.

In man, apart from having similar hypoglycaemic effect to the other sulphonylureas, gliclazide has been shown to reduce platelet adhesiveness and aggregation and increase fibrinolytic activity. These factors are thought to be implicated in the pathogenesis of long term complications of diabetes mellitus.

Uses For the treatment of maturity onset diabetes in patients who cannot be controlled on diet alone.

Dosage and administration *Adults*: The total daily dose may vary from 40 to 320 mg taken orally. The dose should be adjusted according to the individual patient's response commencing with 40–80 mg daily ($\frac{1}{2}$ –1 tablet) and increasing until adequate control is achieved. Higher doses should be divided according to the main meals of the day.

In obese patients or those not showing adequate response to Diamicon alone, a biguanide may be added.

Children: Diamicon, as with other sulphonylureas, is not indicated for the treatment of juvenile onset diabetes mellitus.

Contra-indications, warnings, etc

Contra-Indications: Diamicon should not be used in:

1. Juvenile onset diabetes.
2. Diabetes complicated by ketosis and acidosis.
3. Pregnancy.
4. Diabetics undergoing surgery, after severe trauma or during infections.
5. Patients known to have hypersensitivity to other sulphonylureas and related drugs.

Precautions: Diamicon is generally well tolerated but nausea, headache, rashes and gastro-intestinal disturbances have been reported. Care should be exercised in patients with hepatic and/or renal impairment and a small starting dose should be used with careful patient monitoring. As with other sulphonylureas, hypoglycaemia will occur if the patients' dietary intake is reduced or if they are receiving a larger dose of Diamicon than required.

Care should be taken when giving Diamicon with drugs which are known to alter the diabetic state or potentiate the drug's action, such as sulphonamides, salicylates, phenylbutazone, β -blocking agents, MAOI's, thiazide diuretics and steroid hormones.

Overdosage: The symptom to be expected of overdose

would be hypoglycaemia. The treatment is gastric lavage and correction of the hypoglycaemia by appropriate means with continued monitoring of the patient's blood sugar until the effect of the drug has ceased.

Pharmaceutical precautions Nil.

Legal category POM.

Package quantities Cartons of 60 tablets (contain three push-through blister strips of 20 tablets).

Further information Nil.

Product licence number 0093/0024.

IMOTEST* -TUBERCULIN ▼

Merieux Tuberculin Test Ring (Purified Tuberculin)

Presentation Each Imotest unit consists of a plastic ring with a 9 mm square setting on which is mounted a platform with nine points arranged in three rows of three. A plastic tube fitted over the platform is filled with purified tuberculin (PPD) (0.05 ml) prior to being hermetically sealed. The entire unit has been sterilised. The reactivity of Imotest is comparable to the intermediate strength Mantoux test (5TU PPD). The ring is designed to fit on the thumb of the administrator.

Uses Imotest-Tuberculin is an intradermal test for the detection of tuberculin sensitivity and is used for screening for tuberculosis.

Dosage and administration *Adults and children*: Tuberculin testing may be done during the first year of life. The frequency of repeated testing may be increased in groups where there is a higher risk of tuberculosis. The recommended site for accurate tuberculin testing is the volar surface of the mid-forearm. The skin should be cleansed with alcohol, ether or acetone and allowed to dry.

Method of application: Place the ring on the thumb so the points protrude from the pulp surface. Carefully remove the tube surrounding the points by a slight twist which breaks the seal. Squeeze the tuberculin from the plastic tube onto the Imotest points until they are covered. Grasp the patient's arm firmly with the free hand stretching the skin of the forearm tightly. Press the loaded points firmly into the cleansed site.

Sufficient pressure should be exerted to produce nine visible puncture sites and an imprint of the square base. Do not wipe the puncture site and allow 3 or 4 minutes exposure before the patient dresses.

Reading the reaction: The test should be read at 48 to 72 hours after administration. Slight local erythema may be observed but the sole criterion for a positive reaction is a palpable induration. It is important to measure exactly the broadest transverse diameter of the induration.

mining under adequate light. This procedure is facilitated by using the millimeter callipers which may be obtained from Servier Laboratories on application. Identification of the application site is usually easy because of the distinct imprint of the points.

Positive reaction: The presence of a palpable induration transverse diameter measuring 3 mm and more constitutes a positive reaction.

Positive reaction: If the diameter of induration measures less than 1 mm the reaction is considered negative.

Doubtful reaction: Induration diameters between 1 mm and 3 mm are considered doubtful reactions.

Contra-indications, warnings, etc

Contra-indication: Erythema nodosum.

Precautions: In the case of severe positive reactions, investigations for pathological causes should be carried out.

Tuberculin testing should be carried out with caution in persons with active tuberculosis. However, activation of quiescent lesions is not to be expected.

Reactivity to the test may be suppressed in patients who are receiving corticosteroids or immunosuppressive agents, or those who have recently been vaccinated with a virus vaccine such as measles.

Do not apply Imotest on areas of acne, hairy areas and areas without adequate subcutaneous tissue.

Discard the Imotest ring and the tube containing tuberculin after use. DO NOT RE-USE.

Side effects: Vesiculation, ulceration, or necrosis may occur at the test site in highly sensitive persons. Pain, pruritus and discomfort at the test site may be relieved by cold packs or by a topical corticosteroid preparation.

Pharmaceutical precautions Imotest should be stored at room temperature in the original pack.

Legal category POM.

Package quantities Box of 10 tests.

Further information Nil.

Product licence number 0093/0041.

ISOCABITOL*

Presentation 10 ml of 0.25% solution of fusafungine in a pressurised aerosol container designed to give approximately 200 metered doses. Each metered dose contains approximately 125 mcg fusafungine. Two attachments, one for nasal use, one for oral use, are supplied.

Fusafungine is an antibiotic produced by *Fusarium termitum* strain 437.

Uses A topical antibiotic with anti-inflammatory properties for the treatment of infections and inflammatory conditions of the upper respiratory tract.

Dosage and administration **Administration:** By inhalation using the appropriate attachment.

Dosage: **Adults:** Nasal – 3 metered doses in each nostril 4 times a day.

Oral – 5 metered doses five times a day.

Children	Nasal – in each nostril five times a day	Oral – three times a day
–5 years	1 metered dose	2 metered doses
–12 years	2 metered doses	3 metered doses
12 years	3 metered doses	4 metered doses

Contra-indications, warnings, etc

Contra-indication: Sensitivity to fusafungine or excipients.

Warnings: Avoid directing the spray into the eyes, as aerosol sprays can cause irritation.

Side-effects: Some patients may experience a transient stinging sensation.

Pharmaceutical precautions **Storage:** Store at room temperature.

Note. Do not throw full or empty aerosol containers into a fire or subject them to excessive heat.

Legal category POM.

Package quantities Unit pack of one 10 ml aerosol container with one oral and one nasal attachment.

Further information An insert leaflet for patients is included in each pack.

Product licence number 0093/5003.

MFV-JECT* ▼

Presentation MFV-JECT is available in mono-dose pre-filled syringes and multidose vials. MFV-JECT is Influenza Vaccine BP, purified by zonal ultra-centrifugation and extraction with ether. The strains of influenza virus contained in the vaccine are those currently recommended each year by the World Health Organisation. Each dose also contains not more than 0.05 mg of thiomersal as preservative.

Uses Prophylaxis against influenza.

Dosage and administration By subcutaneous or intramuscular injection.

Adults and children over 13 years: Single dose; 0.5 ml.

Children under 13 years: Not recommended.

The vaccine should be allowed to reach room temperature before use.

Contra-indications, warnings, etc

Contra-indications: Persons known to have sensitivity to egg protein.

Side-effects: The incidence of side-effects with the vaccine is minimal due to the purification method; however, a transient erythema, tenderness or pain at the site of injection or mild fever may appear within the first 48 hours.

Precautions: The vaccine should be used with caution in patients with a history of allergy.

Overdosage: Not applicable.

Pharmaceutical precautions Protect from light and store at 4°C. Do not freeze.

Legal category POM.

Package quantities Monodose in prefilled syringe (0.5 ml); unit dose pack. 10 dose (5 ml) vial; 50 dose (25 ml) vial.

Further information Nil.

Product licence number 0093/0032.

MERIEUX* INACTIVATED RABIES VACCINE (MIRV)

Presentation Human Diploid Cell Rabies Vaccine.

The vaccine is a lyophilised, stabilised suspension of inactivated Wistar rabies virus strain PM/WI 38 1503-3M, cultured on human diploid cells and inactivated by beta-propiolactone. The dry vaccine is coloured off-white but after reconstitution with the diluent supplied it turns a pinkish colour due to the presence of phenol red.

The potency of the reconstituted vaccine is not less than $2.5 \times$ the International Standard per dose (1 ml).

Uses 1. Prophylactic immunisation against rabies.

2. Treatment of patients following suspected rabies contact.

Dosage and administration The dose of reconstituted vaccine in all cases is 1 ml given by deep subcutaneous injection.

Reconstitution: Inject diluent from syringe into vaccine vial, shake to ensure complete reconstitution and withdraw contents back into syringe.

1. **Prophylaxis:** 1 ml of reconstituted vaccine followed by a second dose (1 ml) after a one month interval. A booster dose should be given 6–12 months later. High antibody titres should be maintained by further boosters, the frequency depending on the risk of infection.

2. **Treatment:** The first injection should be given as soon as possible after the suspected contact. Three further doses should be given on the third, seventh and fourteenth day. Booster injections should be given after one month and three months. The treatment schedule may be stopped if the animal concerned is found conclusively to be free of rabies.

Contra-indications, warnings, etc There are no absolute contra-indications to inactivated rabies vaccine cultured on human diploid cells. Redness, swelling or tenderness at the site of injection may occur during the first 48 hours. A mild fever has been reported in about 1% of cases during the first 24 hours. In subjects with a history of allergy there may be an increased risk of side-effects and this possibility should be taken into account.

Pharmaceutical precautions Store at 4°C, do not freeze. Use immediately after reconstituting the vaccine.

Legal category POM.

Package quantities A vial of lyophilised vaccine containing one dose together with a disposable syringe containing 1 ml of diluent.

Further information Nil.

Product licence number 0093/0028.

MERIEUX* ORAL POLIOMYELITIS VACCINE Poliomyelitis Vaccine (Oral) ▼

Presentation The product is available in single dose ampoules and multi-dose vials. The vaccine is a sterile aqueous suspension of suitable live attenuated strains of poliomyelitis virus types 1, 2 and 3 grown in monkey kidney cell cultures. The virus strains are those chosen by Sabin for their antigenic potency and safety.

Each dose contains:

Poliomyelitis virus type 1 $\geq 3 \times 10^5$ TCID₅₀

Poliomyelitis virus type 2 $\geq 1 \times 10^5$ TCID₅₀
Poliomyelitis virus type 3 $\geq 3 \times 10^5$ TCID₅₀

and magnesium chloride and human serum albumin stabilisers. The vaccine may appear pink due to presence of phenol red and may contain traces neomycin.

Uses Prophylaxis against poliomyelitis.

Dosage and administration By oral administration only. The contents of a single dose ampoule (0.5 ml), two drops (0.1 ml) of vaccine from a multi-dose vial, be conveniently administered on a lump of sugar directly into the mouth.

Primary Immunisation – Adults and children: 3 doses; intervals of not less than 4 weeks.

In the United Kingdom, oral polio vaccine is normally given to infants at the same time as routine vaccination against diphtheria, tetanus and pertussis.

Reinforcing doses – Adults: Reinforcing doses may be given to adults if they are likely to be exposed to special risk of contracting the disease.

Children: 1 dose upon school entry and again at 15-years of age or upon leaving school.

Contra-indications, warnings, etc

Contra-indications: Acute febrile illness or any suspected infection, malignant disease, impaired immune responsiveness e.g. steroid treatment, radiotherapy. The vaccine should not be administered to pregnant women, unless they are known to be at definite risk from poliomyelitis.

Precautions: The efficacy of the vaccine may be impaired if given when the subject has diarrhoea or gastrointestinal dysfunction. The vaccine should not generally be administered within 3–4 weeks of another live vaccine.

Warnings: The vaccine may contain trace amounts neomycin. Administration of vaccine to subjects known to be hypersensitive to this antibiotic should be avoided.

The vaccine may contain minute traces of penicillin carried over from the original Sabin strains but this does not normally contra-indicate use except in extreme cases of hypersensitivity.

Other unvaccinated members of the household, including adults, are advised to have a vaccination at the same time as the vaccinee.

Overdosage: Not applicable.

Pharmaceutical precautions If stored at –20°C, the vaccine can be expected to retain its potency up to the expiry date indicated on the pack. After thawing, store at +4°C for no longer than 6 months. Do not re-freeze. Once opened, any unused vaccine must be discarded after 4 hours.

Legal category POM.

Package quantities Single-dose snap-open ampoules (0.5 ml) unit dose pack. 10 dose (1 ml) vial.

Box of 10 droppers for use with multi-dose vials.

Further information Nil.

Product licence number 0093/0042.

NATRILIX* ▼

Presentation Pink biconvex sugar-coated tablets each containing 2.5 mg indapamide hemihydrate.

Uses For the treatment of hypertension.

atrilix may be used as sole therapy or combined with antihypertensive agents.

Dosage and administration *Adults:* The dosage is 1 tablet, containing 2.5 mg indapamide hemihydrate, daily taken in the morning. The action of Natrilix is progressive and the reduction in blood pressure may continue and not reach a maximum until several months after the start of therapy. A larger dose than 2.5 mg Natrilix daily is not recommended as there is no appreciable additional antihypertensive effect but a diuretic effect may become apparent. If a single daily tablet of Natrilix does not achieve a sufficient reduction in blood pressure, another antihypertensive agent may be added; those which have been used in combination with Natrilix include beta-blockers, methyldopa, clonidine and other adrenergic blocking agents. The combination of Natrilix with diuretics which may cause hypokalaemia is not recommended. There is no evidence of rebound hypertension on withdrawal of Natrilix.

Children: There is no experience of the use of this drug in children.

Contra-indications, warnings, etc There are no absolute contra-indications to the use of Natrilix but caution should be exercised when prescribing it in cases of severe renal or hepatic impairment.

As with all new drugs, the administration of Natrilix should be avoided during pregnancy although no teratological effects have been seen in animals.

At doses of higher than that recommended, Natrilix has a diuretic effect, therefore it is not recommended to combine it with a diuretic agent which may cause hypokalaemia. Also, slight weight loss has been reported in some patients taking Natrilix. Reported side-effects include nausea and headache, but they are generally uncommon and mild in nature. Serum uric acid levels may rise slightly but there is no evidence that uric acid tolerance is adversely affected.

Overdosage: Symptoms of overdosage would be those associated with a diuretic effect: electrolyte disturbances, hypotension and muscular weakness. Treatment should be symptomatic, directed at correcting the electrolyte abnormalities and gastric lavage or emesis should be considered.

Pharmaceutical precautions Nil.

Legal category POM.

Packaging quantities Cartons of 30 tablets (containing 10 push-through blister strips of 15 tablets) and cartons of 60 tablets (containing three push-through blister strips of 20 tablets).

Other information No interactions have been reported between Natrilix and oral hypoglycaemic agents, anticoagulants, uricosurics and anti-inflammatory agents.

Product licence number 0093/0022.

ONDERAX PACAPS* PONDERAX* 20 mg **ONDERAX* 40 mg**

Description *Ponderax Pacaps:* Prolonged action formulation in hard gelatin capsule, size 3 with clear body and opaque blue cap, printed in black with Px PA containing small white pellets. Each prolonged action capsule contains 60 mg fenfluramine hydrochloride BP.

Ponderax 20 mg: Pale blue sugar-coated tablet containing 20 mg fenfluramine hydrochloride BP.

Ponderax 40 mg: White sugar-coated tablet, containing 40 mg fenfluramine hydrochloride BP.

Uses

1. Obesity.
2. Maturity-onset diabetes.

For the control of post-prandial hyperglycaemia in maturity onset diabetics who achieve marginal control either with diet alone or diet plus sulphonylureas.

Dosage and administration *Dosage: (1) Obesity: Adults:* 1–2 mg per kg of desirable body weight according to the severity of obesity.

Ponderax Pacaps: The recommended adult daily dose of 60 mg capsules is 1 or 2 capsules taken at the same time, once daily, according to the severity of obesity. When a dosage of 2 capsules is prescribed the dosage for the first and last week of treatment should be 1 capsule daily.

Ponderax 20 mg and Ponderax 40 mg: The recommended adult dose of Ponderax tablets is as follows:

Severe obesity: (1st week) 20 mg twice a day; (2nd week) 40 mg twice a day; (maintenance) 40 mg three times a day.

Moderate obesity: (1st week) 20 mg twice a day; (maintenance) 40 mg twice a day.

Mild obesity: (1st week) 20 mg twice a day; (maintenance) 20 mg three times a day.

On stopping treatment the dosage should be gradually reduced.

Dosage: Children: Recommended children's daily dose of 20 mg Ponderax tablets:

6–10 years: 20 mg.

10–12 years: 40 mg (in divided doses). This may be increased to 60 mg if the child is grossly obese.

A gradual build-up and reduction of dosage is advised.

Ponderax Pacaps: The capsule form is not suitable for children's dosage.

Dosage: (2) Maturity Onset Diabetes: Adults: The dosage must be adjusted to the needs of the individual patient and may vary between 80–120 mg daily, taken either as tablets or Ponderax Pacaps. Ponderax may be given together with sulphonylureas.

Children: Not applicable.

Administration: Ponderax tablets and Pacaps should be taken orally. Ponderax tablets should be taken in divided daily doses and Ponderax Pacaps, because of the slow release of the active constituent, need be taken only once daily; preferably before breakfast. If possible the tablets or capsules should be taken half an hour before food.

Contra-indications, warnings, etc Should not be used concomitantly with MAOIs. There should be an interval of three weeks between stopping MAOIs and starting Ponderax. Care should be exercised when giving Ponderax to depressed patients or those receiving antidepressant therapy.

Following sudden withdrawal of high therapeutic doses of Ponderax occasional reports of depression, lasting a few days, have been received. This effect may be avoided by a gradual reduction of dosage.

Ponderax may potentiate the action of antihypertensive, antidiabetic and sedative drugs. The dosage of

these drugs should be reassessed when Ponderax is prescribed.

In those patients who experience sedation with Ponderax care should be taken when driving, working machinery or taking alcohol.

It is recommended that Ponderax is not given concomitantly with other appetite suppressants. There should be an interval of two weeks before stopping any other appetite suppressant and starting Ponderax to allow for any possible withdrawal symptoms to subside.

Although both human and animal studies have demonstrated that there are no harmful effects on the foetus, it is not recommended that Ponderax be administered during the first trimester of pregnancy unless the physician considers that the benefits outweigh any possible risk.

Side-effects: In some patients looseness of the bowels, mild sedation and giddiness may occur. Nausea and headache have been reported. Side-effects may be reduced or avoided by using a gradual build up of dosage; in other patients the effects are often transient and a temporary reduction of dosage will usually eliminate them. Side-effects only rarely necessitate any interruption of therapy.

Overdosage: The following symptoms have been reported: dilated pupils, tachycardia, facial flushing, hypertension, agitation, fine tremor. The symptoms can progress to vomiting, convulsions, unconsciousness, hyperpyrexia. Depression of respiration, cardiac arrhythmias, ventricular fibrillation and death may occur following very high overdosage.

Action to be taken in the event of an overdose: i) monitor ECG continuously; ii) use diazepam to control convulsions; iii) reduce hyperthermia; iv) use anti-arrhythmic drugs (e.g. beta-blockers) to control cardiac tachyarrhythmias.

Pharmaceutical precautions *Storage:* Ponderax PACAPS should be stored in a cool, dry place.

Legal category POM.

Package quantities *Ponderax Pacaps:* Push-through blister strips of 10 capsules.

Carton of 60 capsules (6 strips).

Ponderax 20 mg and Ponderax 40 mg: Push-through blister strips of 20 tablets.

Carton of 100 tablets (5 strips).

Further information Although fenfluramine is chemically allied to amphetamine the introduction of a CF₃ group into the molecule alters the pharmacological characteristics of the compound which are evident from its lack of central nervous system stimulation and its lack of abuse or dependence potential.

Ponderax is not a controlled drug under the Misuse of Drugs Act 1971 or the Misuse of Drugs Regulations 1973.

Ponderax 40 mg 0093/0026

SYN-ERGEL*

Presentation Synergel is a white gel with an odour and flavour of orange. It contains two gels – one aluminium phosphate and the other a natural gel of pectin and agar. Each dose is presented in the form of a 20 g sachet the active constituents of which are aluminium phosphate gel (11 g), with a pectin agar (9 g).

Aluminium phosphate gel is in the form of a microcolloid which has a high adsorptive capacity. A suspension of the gel is neutral (pH 6.5–7) and neither weakly ionised bases nor acids can attack it. The insoluble gel acts as a buffer in the pH range corresponding to that of the gastric contents.

The natural gel is a molecular colloid which adheres to the walls of the digestive tract, as is the case with natural mucin, providing protection for the mucosa and a dispersal medium for the aluminium phosphate gel.

Uses Dyspepsia, gastritis, oesophagitis, gastric ulcer, duodenal ulcer, heartburn in pregnancy, hiatus hernia, hyperacidity, flatulence.

Dosage and administration The usual adult dose is 1 sachet two or three times daily or as directed by a physician. The medication can be taken directly from the sachet or diluted in water. The dosage for children is 5 ml measure per 24 hours for each 4.5 kg weight, to be taken in divided doses.

Contra-indications, warnings, etc There are no known contra-indications to Synergel. Synergel is physico-chemical in its action; it acts locally and is not absorbed. It is not habit forming and may be used over long periods of time without untoward effect.

Pharmaceutical precautions Synergel should be stored in a cool dry place.

Legal category P.

Package quantities Packs of 25 sachets.

CALABAND*

Presentation Calaband is Zinc paste with calamine bandage (Drug Tariff) and consists of an open-wave bleached cotton bandage impregnated evenly with a paste of:

Zinc Oxide BP	9.25%
Calamine BP	5.75%
Modified Starch	19.15%
Boric Acid BP	2.0%
Glycerine BP	27.0%
Castor Oil BP	1.0%
Propyl Hydroxybenzoate BP	0.2%
Water to	100%

The bandage is pink in colour and supplied rolled ready for use. It is presented wrapped in waxed paper, sealed in an air tight polythene pouch within a cardboard carton.

Uses

1. Varicose and gravitational ulcers, in conjunction with a compression bandage such as Lestreflex* where protection and treatment of an accompanying subacute eczema is required.
2. All non exudative subacute eczemas particularly where erythema predominates.
3. Dermatitis sometimes experienced after removal of Plaster of Paris casts and protecting areas of contact dermatitis from further irritation.

Dosage and administration The bandage is for topical application and may be renewed as frequently as the condition requires.

Contra-indications, warnings, etc Allergy to an ingredient of the paste.

Pharmaceutical precautions The bandage should be stored in a cool place.

Legal category POM.

Package quantities Calaband is supplied as a single bandage 7.5 cm x 6 m in a carton.

Further information Calaband is intended to be covered, by a compression bandage for the treatment of leg ulcers, or by a tubular bandage for other conditions in order to prevent the soiling of clothes and to reduce drying out of the bandage.

The incidence of hyper-sensitivity reaction is extremely rare.

Product licence number 0223/5003.

ICTHABAND*

Presentation Ichthaband is Zinc paste and ichthammol bandage BPC (Drug Tariff) and consists of an open-wave bleached cotton bandage impregnated evenly with a paste of:

Zinc Oxide BP	15.0%
---------------	-------

Modified Starch	18.5%
Glycerine BP	27.0%
Castor Oil BP	1.0%
Boric Acid BP	2.0%
Ichthammol BP	2.0%
Propyl Hydroxybenzoate BP	0.2%
Water to	100%

The bandage is beige in colour and supplied rolled ready for use. It is presented wrapped in waxed paper, sealed in an air tight polythene pouch within a cardboard carton.

Uses

1. Subacute eczematous conditions.
2. Chronic eczema, where tar is not tolerated.
3. Subacute gravitational eczemas and all other forms of leg eczema.
4. Varicose and gravitational ulcers, in conjunction with a compression bandage such as Lestreflex*, when a protective barrier to thin and fragile skin is required.

Dosage and administration The bandage is for topical application and may be renewed as frequently as the condition requires.

Contra-indications, warnings, etc Allergy to an ingredient of the paste.

Pharmaceutical precautions The bandage should be stored in a cool place.

Legal category GSL.

Package quantities Ichthaband is supplied as a single bandage 7.5 cm x 6 m in a carton.

Further information The formulation of Ichthaband is intended to overcome the drying tendency of ichthammol. It is intended that the bandage be covered, by a compression bandage in the treatment of leg ulcers, or by a tubular bandage for other conditions in order to prevent soiling of clothes and to reduce drying out of the bandage.

The incidence of hyper-sensitivity reaction is extremely rare.

Product licence number 0223/5001.

QUINABAND*

Presentation Quinaband is Zinc paste, calamine and clioquinol bandage (Drug Tariff) and consists of an open-wave bleached cotton bandage impregnated evenly with a paste of:

Zinc Oxide BP	9.25%
Clioquinol	1.0%
Calamine BP	5.75%
Modified Starch	18.5%
Boric Acid BP	2.0%
Glycerine BP	27.0%
Castor Oil BP	1.0%

Propyl Hydroxybenzoate BP	0.0625%
Water to	100%

The bandage is yellow in colour and supplied rolled ready for use. It is presented wrapped in a waxed paper, sealed in an air tight polythene pouch within a cardboard carton.

Uses

1. Varicose and gravitational ulcers, in conjunction with a compression bandage such as Lestreflex*. Quinaband will reduce the odour often associated with leg ulcers and is particularly useful if the ulcer is infected.

2. Conditions liable to become secondary infected such as burns and scalds.

Dosage and administration The bandage is for topical application and may be renewed as frequently as the condition requires.

Contra-indications, warnings, etc Allergy to an ingredient of the paste.

Pharmaceutical precautions The bandage should be stored in a cool place.

Legal category GSL.

Package quantities Quinaband is supplied as a single bandage 7.5 cm x 6 m in a carton.

Further information Quinaband is impregnated with cloquinol 1.0%. This antibacterial agent has a low sensitising potential and a wide spectrum of action. Resistance on the part of organisms does not occur.

It is intended that the bandage be covered, by a compression bandage for the treatment of leg ulcers, or by a tubular bandage for other conditions in order to prevent soiling of clothes and to reduce drying out of the bandage.

The incidence of hyper-sensitivity reactions is extremely rare.

Product licence number 0223/5005.

TARBAND*

Presentation Tarband is Zinc paste and coal tar bandage BP (Drug Tariff) and consists of an open-wave bleached cotton bandage impregnated evenly with a paste of:

Zinc Oxide BP	15.0%
Prep. Coal Tar BP 1973	3.0%
Glycerine BP	27.0%
Propyl Hydroxybenzoate BP	0.2%
Modified Starch	18.5%
Castor Oil BP	1.0%
Water to	100%

The bandage is grey in colour and supplied rolled ready for use. It is presented wrapped in a waxed paper, sealed in an air tight polythene pouch within a cardboard carton.

Uses

1. All forms of chronic eczema.
2. Lichenification (lichen simplex) and lichenified eczema.

3. Infantile eczema.

4. Atopic dermatitis.

5. Varicose and gravitational ulcers, in conjunction with a compression bandage such as Lestreflex*, where protection and treatment of an accompanying eczema is required.

Dosage and administration The bandage is for topical application and may be renewed as frequently as the condition requires.

Contra-indications, warnings, etc Allergy to an ingredient of the paste and acute eczematous lesions.

Pharmaceutical precautions The bandage should be stored in a cool place.

Legal category GSL.

Package quantities Tarband is supplied as a single bandage 7.5 cm x 6 m in a carton.

Further information Tarband is intended to be covered, by a compression bandage for the treatment of leg ulcers, or by a tubular bandage for other conditions in order to prevent soiling of clothes and to reduce drying out of the bandage.

The incidence of hyper-sensitivity reaction is extremely rare.

Product licence number 0223/5004.

ZINCABAND*

Presentation Zincaband is Zinc paste bandage BP (Drug Tariff) and consists of an open-wave bleached cotton bandage impregnated evenly with a paste of:

Zinc Oxide BP	15.0%
Modified Starch	18.5%
Glycerine BP	27.0%
Castor Oil BP	1.0%
Boric Acid BP	2.0%
Propyl Hydroxybenzoate BP	0.2%
Water to	100%

The bandage is off-white in colour and supplied rolled ready to use. It is presented wrapped in waxed paper, sealed in an air tight polythene pouch within a cardboard carton.

Uses

1. Varicose ulcers, where protection and a soothing application is indicated, in conjunction with a compression bandage such as Lestreflex*.

2. Subacute and chronic eczema.

3. Dermatitis of the hand or wrist.

4. Lichenification.

Dosage and administration The bandage is for topical application and may be renewed as frequently as the condition requires.

Contra-indications, warnings, etc Allergy to an ingredient of the paste.

Pharmaceutical precautions The bandage should be stored in a cool place.

Legal category GSL.

Package quantities Zincaband is supplied as a single bandage 7.5 cm x 6 m in a carton.

Further information Zincaband is especially formulated to retain its smoothness and consistency. It is intended that the bandage be covered, by a compression bandage for the treatment of leg ulcers, or by a tubular bandage for other conditions in order to prevent soiling of clothes and reduce drying out of the bandage.

The incidence of hyper-sensitivity reaction is extremely rare.

Product licence number 0223/5000.

ALUHYDE*

Presentation Each off-white scored tablet contains:
Dried Aluminium Hydroxide Gel BP 245 mg
Magnesium Trisilicate BP 245 mg
Belladonna Extract, Liquid BPC 7.8 mg
The alkaloids of belladonna have a spasmolytic action in the smooth muscle in the treatment of intestinal and biliary colic.

As in contrast to other antacids, Magnesium Trisilicate does not give rise to alkalosis and its antacid action is prolonged; the compound is of great value in the treatment of gastric and duodenal ulcers.

Dried Aluminium Hydroxide Gel as a slow-acting antacid, provides symptomatic relief in gastric and duodenal ulcer, in reflux eosophagitis and is used in the treatment of hyperchlorhydria.

Uses Antacid and antispasmodic, gastric and duodenal ulcer, gastritis, pylorospasm, hyperchlorhydria, functional dyspepsia, gall bladder dyspepsia, and irritable bowel syndrome.

Dosage and administration 2 tablets to be taken after each meal, preferably with a cupful of milk, or before each meal according to the discretion of the physician.

Contra-indications, warnings, etc *Contra-indications:* Glaucoma and acute intermittent porphyria.

Precautions: Caution should be observed in patients with prostatic enlargement, angina pectoris, cardiac failure, and in patients with impaired hepatic or renal function.

Side-effects: These are rare and include Xerostomia and disturbances of vision.

Overdose: Treatment should be directed towards the elimination of the injected material by emesis, aspiration and gastric lavage. General supportive measures should be applied with particular reference to the cardiovascular and respiratory system.

Pharmaceutical precautions *Storage:* No special storage requirements.

Legal category POM.

Package quantities Containers of 50 and 500 tablets.

Further information Nil.

Product licence number 0622/5906.

CAPRIN*

Presentation Each pink tablet of Caprin contains 324 mg (5 grains) of compacted acid resistant acetylsalicylic acid.

Caprin has been designed to minimise or eliminate the gastric side-effects of aspirin and will be useful in rheumatoid arthritis or when long term salicylate therapy is indicated.

Caprin tablets are produced under very heavy pressure resulting in a compacted tablet which will not disintegrate in the stomach. The possibility of surface erosion or diffusion in an acid medium has been overcome by the application of a long chain polymer to the aspirin prior to compression. The polymer has the property of being resistant to acid but it swells on contact with alkali. This, together with the acid-alkali interaction between aspirin and the alkaline medium of the duodenum, provides rapid disintegration and absorption.

Uses Caprin is especially valuable in acute and chronic rheumatic states when long-term aspirin therapy is necessary.

Dosage and administration 1-4 tablets. 3-4 times daily as required.

This is identical with ordinary Aspirin. The tablets must not be chewed or crushed and Caprin tablets are best taken before meals.

Dosage should be adjusted according to the daily salicylate requirements. 15 tablets are equivalent to 5 grammes of Aspirin.

Contra-indications, warnings, etc *Side-effects and precautions:* Caprin is contra-indicated in aspirin allergy. The side-effects of gastric irritation and occult bleeding are eliminated. Caprin should not be taken with concurrent antacid therapy.

Overdosage should be treated initially by aspiration and lavage and a saline purgative such as sodium sulphate, 30 g in 250 ml of water should be given to promote peristalsis. Otherwise treat as for aspirin poisoning.

Pharmaceutical precautions

Storage: No special storage requirements.

Legal category GSL.

Package quantities Containers of 100 and 1000 tablets.

Further information Nil.

Product licence number 0622/5000.

CLAIRVAN* INJECTION

Presentation Clairvan Injection is presented as 2 ml ampoules, containing a 5% solution of Ethamivan BPC. It is also available as Clairvan Oral Solution for use in infants.

Uses Clairvan is a respiratory stimulant which is useful in reversal of barbiturate anaesthesia; management of carbon dioxide narcosis, and to alleviate respiratory depression in patients with chronic obstructive pulmonary disease receiving oxygen therapy; treatment of barbiturate poisoning; neonatal asphyxia (oral solution).

Clairvan increases the rate and depth of respiration by

action through the respiratory centre. This activity is complemented by a stimulant effect on the vasomotor centre which causes peripheral vasoconstriction.

Clairvan has an immediate onset of action but, because it is rapidly metabolised, its stimulant action is short. Repeated dosage is therefore necessary.

Dosage and administration Clairvan is given intravenously except to very young children when it may be given lingually, in the form of the oral solution.

Children: The drug is usually administered by the lingual route and the effect on respiration is comparable to that of the same dose given by intravenous injection. Response to treatment usually begins within one minute and lasts for about five to ten minutes.

Full term infant: 12 drops (to graduation mark on dropper – 25 mg.)

Premature infant: 6 drops (12.5 mg).

Clairvan Oral Solution should be administered after routine aspiration of the air passages. If there is no response to the recommended dose within two minutes, the respiratory depression may be assumed to be irreversible by any available safe chemotherapeutic agent. Intubation should be carried out.

Adults: Reversal of barbiturate anaesthesia: intravenous injection of 1 ml (5% solution) repeated in one minute if necessary. In some cases, 3 to 5 ml is required and should be administered over 10 to 15 minutes.

Barbiturate poisoning: initially, injection of 5 to 10 mg/kg, an average of 10 ml (5% solution) in adults; repeat if required.

Barbiturate poisoning should be treated with measures to maintain respiration, correct electrolyte imbalance and by removal of any drug from stomach. Severe cases of phenobarbitone poisoning should in addition be given forced alkaline diuresis. Clairvan is a useful adjunct to treatment particularly in the less severe cases.

Carbon dioxide narcosis: Intermittent intravenous injection of 2 ml (5% solution).

Contra-indications, warnings, etc Clairvan should not be given to epileptic patients or to those with respiratory failure caused by a convulsant drug. It should not be given to patients who are being treated with a monoamine oxidase inhibitor such as isocarboxazid, nialamide, phenelzine or tranylcypromine, or within two weeks of the discontinuation of such treatment.

Side-effects: Spontaneous motor activity – limb movement, coughing, yawning or hiccoughing – is a sign of response to treatment with Clairvan. A repeat dose should then only be administered with caution, as overdose may lead to convulsions.

Overdose treatment: The drug is rapidly metabolised and no specific treatment is usually necessary apart from general supportive measures. Short acting barbiturates, e.g. thiopentone, counteract the convulsive effect of Clairvan.

Pharmaceutical precautions Protect from light.

Legal category POM.

Package quantities Clairvan is supplied in boxes containing 6 x 2 ml ampoules; also 5 ml dropper bottles of Oral Solution for infants.

Further information Nil.

Product licence number 0622/0008.

CLAIRVAN* ORAL

Presentation Clairvan Oral Solution is available in glass dropper bottles. Each bottle contains 5 ml solution of Ethamivan BPC 5% (50 mg/ml) in 25% ethyl alcohol.

Uses Clairvan Oral is a respiratory stimulant, specifically designed for simple administration to neonates. It is indicated in neonatal asphyxia, cyanotic attacks (as seen in premature infants), respiratory distress syndrome (hyaline membrane disease).

Ethamivan increases the rate and depth of respiration by action through the respiratory centre and reflexly through the carotid body. This activity is complemented by a stimulant effect on the vasomotor centre which causes peripheral vasoconstriction.

Clairvan has an immediate onset of action as a result of its rapid absorption from the mucous membrane of the tongue and mouth. It is rapidly metabolised in the tissue. The effect on respiration by the lingual route is comparable to that of the same dose given by intravenous injection. Response to treatment usually begins within one minute and lasts for about five to ten minutes.

Dosage and administration

Full term infant: 12 drops (to graduation mark on dropper – 25 mg).

Premature infant: 6 drops (12.5 mg).

Clairvan Oral Solution should be administered after routine aspiration of the air passages. If there is no response to the recommended dose within two minutes the respiratory depression may be assumed to be irreversible by any available safe chemotherapeutic agent. Intubation should be carried out.

Contra-indications, warnings, etc

Side-effects and overdose: Symptoms of overdose are irritability, gasping respiration and muscle twitching. Clairvan Oral Solution should therefore be administered with care, if these symptoms start to appear.

Contra-indications: None.

Pharmaceutical precautions No special storage precautions are required. After use, the bottle should be re-closed with the original cap, to prevent evaporation.

Legal category POM.

Package quantities Bottle containing 5 ml supplied with a separate dropper.

Further information Nil.

Product licence number 0622/0009.

FERFOLIC*

Presentation Each dark orange sugar-coated tablet contains:

Folic Acid BP	5 mg
Ferrous Gluconate BP (equivalent to 30 mg Fe)	250 mg
Thiamine Hydrochloride BP	3 mg
Nicotinamide BP	10 mg
Riboflavin BP	1 mg
Ascorbic Acid BP	10 mg

Folic acid is necessary for normal production of red blood-cells; it is readily absorbed from the gastrointestinal tract and rapidly appears in the blood. It is usually well tolerated.

In iron-deficiency anaemia, the daily haemoglobin increase and the iron utilisation coefficient have been found to be much higher after the treatment with Ferrous Gluconate than with various other iron preparations. The combination with Ascorbic Acid proved to be more effective than a comparable tablet without Ascorbic Acid. As anaemias in numerous animal trials proved to be partly due to deficiencies in vitamins, other members of the vitamin B-group, such as Thiamine, Riboflavine and Nicotinamide, are included in the preparation, in order to re-establish a healthy blood-picture and to maintain a normal basal metabolism. The vitamins of the B-group play an essential role in the oxygenation-reduction processes in the organism.

Uses For the prevention and treatment of iron and folic acid deficiency anaemias.

Dosage and administration Three tablets daily for the treatment of anaemia and one to three tablets daily for prophylaxis. The tablets should be administered with food. Therapy in patients with iron deficiency should be continued for 3–6 weeks after the haemoglobin level has returned to normal.

Ferfolic is unsuitable for children.

Contra-indications, warnings, etc

Contra-indications: Patients with known hypersensitivity to iron. Macrocytic anaemia due to vitamin B12 deficiency. Use with caution in patients with haemochromatosis and haemolytic anaemia.

Side-effects: Those associated with oral iron therapy, i.e. nausea, vomiting, diarrhoea or constipation. These are reduced by giving iron preparations with food.

Precautions:

1. The absorption of iron salts is decreased in the presence of antacids.
2. As with all iron preparations, oral tetracycline therapy should be avoided as iron diminishes the absorption of the antibiotic from the gastro intestinal tract.

Overdosage: Excessive iron will produce a corrosive effect in the gastro intestinal tract, with abdominal pain, vomiting and sometimes haematemesis. Treatment is by gastric lavage with 1% sodium bicarbonate followed by oral desferrioxamine 5 g. In very severe cases with high serum levels intravenous desferrioxamine therapy should be used in addition to the oral dose.

Pharmaceutical precautions

Storage: No special storage requirements.

Legal category POM.

Package quantities Containers of 100 and 500.

Further information Nil.

Product licence number 0622/5015.

FERFOLIC* S.V.

Presentation Each pink sugar-coated tablet contains:

Folic Acid BP	5 mg
Ferrous Gluconate BP	250 mg
(equivalent to 30 mg Fe)	
Ascorbic Acid BP	10 mg

Ferfolic S.V. contains iron, folic acid and vitamin C, thus omitting the vitamins of the B group contained in Ferfolic. Thus its suffix S.V. (*sine vitaminis*).

Folic Acid is necessary for normal production of red blood-cells; it is readily absorbed from the gastro-

intestinal tract and rapidly appears in the blood. It is usually well tolerated.

In iron-deficiency anaemia, the daily haemoglobin increase and the iron utilisation coefficient have been found to be much higher after the treatment with Ferrous Gluconate than with various other iron preparations. The combination with Ascorbic Acid proved to be more effective than a comparable tablet without Ascorbic Acid.

Uses For the treatment and prevention of Anaemias associated with folic acid deficiency.

Dosage and administration Three tablets daily for the treatment of anaemia and one to three tablets daily for prophylaxis. The tablets should be administered with food. Therapy in patients with iron deficiency should be continued for 3–6 weeks after the haemoglobin level has returned to normal.

Ferfolic S.V. is unsuitable for children.

Contra-indications, warnings, etc

Contra-indications: Patients with known hypersensitivity to iron. Macrocytic anaemia due to vitamin B12 deficiency. Use with caution in patients with haemochromatosis and haemolytic anaemia.

Side-effects: Those associated with oral iron therapy, i.e. nausea, vomiting, diarrhoea or constipation. These are reduced by giving iron preparations with food.

Precautions:

1. The absorption of iron salts is decreased in the presence of antacids.
2. As with all oral iron preparations, oral tetracycline therapy should be avoided as iron diminishes the absorption of the antibiotic from the gastrointestinal tract.

Overdosage: Excessive iron will produce a corrosive effect in the gastro intestinal tract, with abdominal pain, vomiting and sometimes haematemesis. Treatment is by gastric lavage with 1% sodium bicarbonate followed by oral desferrioxamine 5 g. In very severe cases with high serum levels intravenous desferrioxamine therapy should be used in addition to the oral dose.

Pharmaceutical precautions

Storage: No special storage requirements.

Legal category POM.

Package quantities Containers of 100 and 500.

Further information Nil.

Product licence number 0622/5016.

FERGLUVITE*

Presentation Each yellow sugar-coated tablet contains:

Ferrous Gluconate BP	250 mg
(equivalent to 30 mg Fe)	
Thiamine Hydrochloride BP	3 mg
Nicotinamide BP	10 mg
Riboflavine BP	1 mg
Ascorbic Acid BP	10 mg

In iron-deficiency anaemia, the daily haemoglobin increase and the iron utilisation coefficient have been found to be much higher after the treatment with Ferrous Gluconate than with various other iron preparations.

The combination with Ascorbic Acid proved to be more effective than a comparable tablet without Ascorbic Acid.

As anaemias in numerous animal trials proved to be partly due to deficiencies in vitamins, members of the vitamin B-group, such as Thiamine, Riboflavine and Nicotinamide, are included in the preparation, in order to re-establish a healthy blood-picture and to maintain a normal basal metabolism. The vitamins of the B-group play an essential role in the oxygenation – reduction processes in the organism.

Uses Hypochromic and microcytic anaemias.

Dosage and administration One to two tablets 3 times daily after meals.

Contra-indications, warnings, etc

Side-effects and precautions: The tablets are well tolerated at the recommended dosage, and side-effects are uncommon. Therapeutic doses of iron may cause gastro-intestinal discomfort and diarrhoea, but may not necessitate stopping treatment. Overdosage with iron-preparations have a corrosive effect on the stomach, illustrated by epigastric pain, diarrhoea, vomiting, and haematemesis. In acute poisoning, induce emesis, followed by gastric lavage with a 1% solution of sodium bicarbonate.

Pharmaceutical precautions

Storage: No special storage requirements.

Legal category GSL.

Package quantities Containers of 100 and 500.

Further information Nil.

Product licence number 0622/5018.

GLYKOLA*

Presentation A dark red syrupy liquid with a pleasant sweet fruity taste.

Each 5 ml contains:

Caffeine Alkaloid	20 mg
Calcium Glycerophosphate	30 mg
Kola Extract, Liquid	0.12 ml
Chloroform Spirit	0.12 ml
Ferric Chloride Solution	0.01 ml
Alcohol 95%	0.5 ml

Caffeine stimulates the central nervous system and acts on the cardiac muscle and on the kidneys.

The Glycerophosphate, a constituent of lecithin, contained in the brain, for many years has been widely used as a tonic in debilitated conditions and in convalescence.

The Kola drug, known to the medical profession for over 100 years, contains caffeine and has a peculiar stimulating effect in so far, as it does not leave the secondary depression, unlike the after-effects of the ordinary stimulants, which gradually develop into an irresistible desire for continuation of the use of the drug. Thus Kola is not habit-forming, a point of inestimable value in its favour. The physiological action of Kola differs from that of caffeine in so far as it is more pronounced and prolonged; the reason being, that the glycoside kolamin has to be hydrolyzed into caffeine and tannine by the metabolism.

Ferric Chloride Solution is included in the preparation, as iron is fundamentally needed for haemoglobin formation and for the oxidative processes of living tissues.

Uses A powerful general tonic and restorative pick me-up, useful in post-operative and post-influenza Convalescence, Asthenia, Debility and Depressive States.

Dosage and administration 1–2 teaspoonful 3 times daily after meals.

Contra-indications, warnings, etc

Contra-indications: None.

Precautions: The preparation should be given with care to patients with a history of peptic ulceration. The oral administration of iron preparations sometimes produce gastro-intestinal irritation with vomiting and diarrhoea which may be reduced by administration immediately after food.

Pharmaceutical precautions

Storage: No special storage requirements.

Legal category GSL.

Package quantities Bottles of 1 litre.

Further information Nil.

Product licence number 0622/5020.

GLYKOLA* INFANS

Presentation A dark reddish-brown liquid with a pleasant sweet fruity taste.

Each 5 ml contains:

Manganese Glycerophosphate	10 mg
Ferric Chloride Solution	0.016 ml
Kola Extract, Liquid	0.066 ml
Compound Gentian Infusion	1.000 ml
Citric Acid	40 mg

Manganese, being a normal component of the body plays an important physiological role in the metabolism especially as a catalyst for iron it increases its haematinic action.

The Ferric Chloride Solution is included in the preparation, as iron is fundamentally needed for the haemoglobin formation and for the oxidative processes of living tissues.

The Glycerophosphate, a constituent of lecithin contained in the brain, has for many years been widely used as a tonic in debilitated conditions and in convalescence.

The Kola drug, known to the medical profession for over 100 years, contains caffeine and has a peculiar stimulating effect in so far as it does not leave the secondary depression, unlike the after-effects of the ordinary stimulants, which gradually develop into an irresistible desire for a continuation of the use of the drug. Thus Kola is not habit-forming, a point of inestimable value in its favour. The physiological action of Kola differs from that of caffeine, in so far, as it is more pronounced and prolonged, the reason being, that the glycoside kolamin has to be hydrolyzed into caffeine and tannine by the metabolism.

Gentian is the most important of the *amara* and is used to stimulate gastric secretion and, thus, improve the appetite; it contains the bitter glycoside gentiopicrin.

Furthermore, it has been proved that, even after small doses of Gentian, an increase in the white and red blood-corpuscles took place.

Uses A tonic for children, useful in post-operative and post-influenza Convalescence, Asthenia, Debility and Depressive States.

Dosage and administration

Children of 6 months to 2 years: 1–2 ml.

Children over 2 years: 2–5 ml.

Both: 3 times daily, well diluted with water, after meals.

Contra-indications, warnings, etc

Contra-indications: None.

Precautions: The preparation should be given with care to children with a history of peptic ulceration. The oral administration of iron preparations sometimes produces gastro-intestinal irritation with vomiting and diarrhoea, which may be reduced by administration immediately after food.

Pharmaceutical precautions

Storage: No special storage requirements.

Legal category GSL.

Package quantities Bottles of 1 litre.

Further information Nil.

Product licence number 0622/5021.

LEDCLAIR* INJECTION

Presentation Each 5 ml ampoule contains 1 g Sodium Calciumedetate BP in water for injection.

Uses Ledclair Injection is indicated in the treatment of lead and other heavy metal poisoning.

Sodium calciumedetate is the calcium chelate of disodium ethylenediamine tetra-acetic acid (E.D.T.A.). E.D.T.A. combines with polyvalent metallic ions to form a non-ionised water-soluble complex or chelate. When this complex is given either by injection or orally, the calcium is exchanged for lead in the plasma; compounds of E.D.T.A. do not enter the erythrocytes. Lead is mobilised from the bones and other tissues into the plasma where the exchange occurs. It is also gradually lost from the erythrocytes probably due to migration of lead into the plasma. The chelate of lead (and certain other heavy metals) is water-soluble and is readily excreted via the kidneys.

Ledclair may be used for the diagnosis of early and mild cases of lead poisoning. In this test the total amount and concentration of lead excreted in the urine during the 24 hours after drug administration is determined. The output of a normal child after treatment average 165 mcg/Litre. Concentrations in excess of 500 mcg/Litre indicate the presence of potentially toxic amounts of lead in the body and the patient should be investigated further.

Dosage and administration

Adults and Children: The injection may be given by either the intravenous or intramuscular route.

Intravenous therapy: The contents of a 5 ml (1 g) ampoule should be diluted with 250 to 500 ml of Injection of Sodium Chloride BP or Injection of Dextrose BP 5% and the dilute solution given over a period of at least one hour. The concentration of Ledclair should not exceed 3% in the infusate (one ampoule diluted with at least 33 ml fluid).

The dose is 60–80 mg/kg per day given in two equal divided doses with 8–12 hours between each treatment. This therapy is continued for up to 5 days followed at least 48 hours later, by a further course of up to 80 mg/kg/day for a maximum of 5 days.

It is important not to exceed the maximum daily dose of 80 mg/kg or to give more than a total of 800 mg/kg in the two 5-day treatment periods. If the patient's condition necessitates further treatment with Ledclair after the two five day courses have been completed, there must be an interval of at least 7 days before recommending therapy.

Intramuscular therapy: The same limitations on dosage apply as for intravenous therapy. Procaine (without a preservative) should be added to give a concentration of 1.5% of the anaesthetic. The total daily dose should be divided into two or four injections.

Diagnostic Use: The dose of Ledclair for diagnostic purposes is 75 mg/kg intramuscularly and divided into three equal doses given at 8-hourly intervals. Procaine should be added as described above for intramuscular therapy.

Contra-indications, warnings, etc

Contra-indications: None.

Precautions: Overdosage can lead to nephro-toxicity and, therefore, considerable care must be exercised in patients with impaired renal function. The doses recommended above should be halved for patients with moderate impairment, the whole dose being given in a single daily injection. It is recommended that smaller and less frequent doses should be used with more severe renal dysfunction.

Side-effects: Nausea and cramp can occur, particularly during intravenous injection.

Overdosage: General supportive measures should be applied and the patient monitored for signs of renal impairment.

Pharmaceutical precautions No special storage requirements.

Legal category POM.

Package quantities Boxes of 6 × 5 ml ampoules (0.2 g/ml).

Further information Nil.

Product licence number 0622/5900.

LIMCLAIR* INJECTION

Presentation Limclair is the trisodium salt of ethylenediamine tetra-acetic acid (E.D.T.A.).

Each 5 ml ampoule contains 0.2 g/ml of Trisodium Edetate in water for injection.

Uses Limclair is indicated for hypercalcaemia, parathyroidism, digitalis arrhythmias and, by local application, for calcareous corneal opacities resulting from lime burns and band keratitis.

When given by injection, sodium ions are exchanged for calcium ions. The resulting sodium/calcium E.D.T.A. complex formed is excreted via the kidneys. The serum calcium concentration is decreased. The speed with which the calcium level is lowered varies with the route of administration, concentration of the solution and the rapidity of the injection. If the injection is too rapid and the serum calcium level is reduced too quickly, hypocalcaemic tetany can result. Development of systemic hypocalcaemia from the administration of Limclair indicates that calcium chelation is proceeding faster than replacement from calcium reserves.

Dosage and administration

Adults: The average dose is 5 g per day. This is administered by slow intravenous infusion up to 70 mg/kg body weight daily.

Children: Up to 60 mg/kg (1 g/35 lb) body weight daily, by slow intravenous infusion.

The dose is best given in 500 ml of 5 per cent glucose or normal saline solution. The intravenous drip is regulated so that from 2 to 3 hours are required for total infusion.

Important: Too rapid intravenous infusion of Limclair or too high concentration, may lower the serum calcium level precipitously and cause hypocalcaemic tetany. This can be fatal if it is of sufficient severity.

Intravenous infusion of Limclair must therefore be undertaken cautiously, slowly, and with dilute solutions.

Contra-indications, warnings, etc

Side-effects: Renal damage, haemorrhagic tendency and damage of the reticuloendothelial system have been reported from excessive dosage. Toxic skin and mucous membrane reactions have been noted, but these disappeared when medication was stopped.

Nausea, diarrhoea and abdominal cramping pains may occur during intravenous treatment.

Caution: Limclair should be used with caution in tuberculosis.

Contra-indication: Renal disease.

Overdosage: Repeated serum calcium determinations are important for control and maintenance of normal calcium levels. Patients should be under constant observation for signs of tetany, when the infusion rate should be decreased or administration discontinued.

Pharmaceutical precautions

Storage: No special storage precautions are required.

Preparation of dilute solution of Limclair for ophthalmic purposes: A 0.4% solution is recommended, and this is obtained by straightforward dilution of 1 in 50 using distilled water as the diluent (i.e. 1 ml. Limclair made up to 50 ml). This solution can be autoclaved.

Legal category POM.

Package quantities Boxes of 6 × 5 ml ampoules (0.2 g/ml).

Further information Nil.

Product licence number 0622/0006.

MYELOBROMOL* TABLETS

Presentation Myelobromol are plain white tablets containing 125 mg of Mitobronitol.

Myelobromol is a cytostatic agent. It is a halogenated derivative of mannitol which has been shown to have a cytotoxic effect on tumour cells and a selective action on the myeloid system.

Myelobromol is an anti-leukaemic agent which differs from other biological alkylating agents in its mode of action.

Animal experiments and *in vitro* studies have shown clearly that it is effective in inhibiting the growth of solid tumours, but its main clinical application to date has been in the treatment of general myeloproliferative disorders and in particular chronic myeloid leukaemia.

In vitro, Myelobromol exhibits the properties of strong alkylating agent but the drug represents transitional form between alkylating agents and antimetabolites.

Myelobromol shows an alkylating behaviour *in vitro* to that of busulphan, but since Myelobromol release two bromine-containing C3 radicals after enzymatic splitting of the molecule it could well exert an epoxidic alkylating effect and thus the presence of the hydroxy groups may play an important part in its cytostatic effectiveness.

Myelobromol is completely absorbed from the gastro intestinal tract and after passing the liver it is secreted in high concentration in the bile.

A maximum initial level is followed, 24 hours later, by a second peak. After reabsorption from the small intestine the agent remains for a prolonged period in a high concentration in the blood, being excreted in the urine over a period of days for the most part unchanged but partly as bromine-containing metabolites.

Uses Chronic myeloid leukaemia. Myelobromol is indicated in newly presenting cases of chronic myeloid leukaemia and also in those cases which have developed resistance to Busulphan therapy.

Dosage and administration Dependent on the severity of the disease:

Initially: 2 tablets daily until the leucocyte count reduces to 20,000/c.mm.

Maintenance: The dosage used will depend upon blood picture and degree of remission. The suggested dosage is between 1 tablet daily and 1 tablet on alternate days. The duration of treatment is usually 8–12 weeks but may be prolonged or resumed as indicated by the leucocyte count.

Myelobromol should only be given by or under the supervision of a physician experienced in the use of anti-leukaemic agents, and haematological monitoring should be carried out at regular intervals.

This product should not normally be administered to patients who are pregnant or to mothers who are breast-feeding.

Contra-indications, warnings, etc Myelobromol is contra-indicated in severe thrombocytopenia subsequent to previous cytotoxic agents.

Daily blood-count monitoring should be performed until haematological values are stable on a given dose of Myelobromol. Subsequent fortnightly examinations of Hb, stained film, total and differential leucocyte counts and a platelet count should be performed.

Myelobromol may exert a non-selective bonemarrow depressant effect. Blood counts should be carried out frequently during Myelobromol therapy. The appearance of severe thrombocytopenia warrants temporary reduction or discontinuation of Myelobromol therapy. Side-effects of Myelobromol are few; those reported include gastro-intestinal disturbances, alopecia, skin pigmentation, skin rashes and menstrual abnormalities.

Treatment of overdosage: Gastric lavage, whole blood transfusion may be necessary.

Pharmaceutical precautions **Storage:** No special requirements.

Legal category POM.

s, etc

with other drugs acting
n, patients should be

instructed to avoid alcohol while under treatment, since the individual response cannot be foreseen. In exceptional cases, Thephorin may produce sedation and modify patients' reactions (driving ability, operation of machinery, etc.).

Side-effects: Thephorin is very well tolerated. Side-effects such as dryness of the mouth and gastro-intestinal complaints are uncommon and can usually be avoided by reducing the dose. Stimulation or, very rarely, drowsiness may occur.

Treatment of overdosage: In toxic doses, the anti-histamines produce a complex of central nervous system excitatory and depressant effects. The excitatory effects may produce delirium, excitement and convulsions. Children are apt to exhibit convulsions with hyper-reflexia.

Gastric lavage should be performed, followed by a saline cathartic, and general supportive measures employed. Convulsions or marked excitement may be controlled by injection of diazepam or a short-acting barbiturate. If respiratory depression and coma occur, oxygen and artificial respiration should be used and normal blood pressure maintained with vasopressor agents. Stimulants should not be given.

Pharmaceutical precautions *Storage:* Thephorin tablets should be stored in well-closed containers.

Legal category P.

Package quantities Thephorin tablets in packings of 50.

Further information Nil.

Product licence number 0622/0025.

TOSMILEN* EYE DROPS

Presentation Clear aqueous solution: demecarium bromide 0.25% and 0.5%.

Uses Cholinesterase inhibitor for treatment of chronic primary glaucoma, concomitant convergent strabismus, as an adjunct after cataract extraction, to correct mydriasis due to atropine medication, in ocular myasthenia gravis.

Dosage and administration *Adults:* To initiate therapy, 1 or 2 drops of 0.25% solution instilled into affected eye.

Children: Initial dose 1 drop.

If the patient has not received the drug before, tonometric measurements should then be made at intervals for two to four hours after the first instillation to detect any paradoxical rise in intra-ocular pressure.

Contra-indications, warnings, etc Asthmatic bronchitis, digestive disorders, gastric and duodenal ulcers, bradycardiac disturbances.

Side-effects: In 50% of cases, a moderate dilatation of the conjunctival vessels occurs immediately after instillation and ceases after 15–20 minutes. In about 10% of cases, a more acute congestion of the conjunctiva occurs, persisting sometimes for two to three days. Some patients complain of a more or less acute burning sensation in the eyes persisting for several minutes after instillation. Other patients suffer from pain persisting for one or two hours after the first installation localised or around the eye, and is probably due to ciliary muscle

spasm. The usual analgesics can be given to the treatment of this unpleasant side effect when it occurs.

Adverse reactions: Symptoms of muscarine-like character occurring as a result of hypersensitivity of overdosage, such as nausea, salivation, sweating, bradycardia, abdominal pain, bronchial constriction, etc., can be controlled by subcutaneous injection of 0.5–2 mg atropine sulphate, which may be repeated at intervals until the symptoms are controlled.

Precautions: The cholinesterase inhibition brought about by Tosmilen can sometimes be demonstrated in the blood and this must be taken into account if muscle-relaxing agents liable to decomposition by cholinesterase are administered systemically.

Long term treatment with Tosmilen, depending on strength of solution, age of patient, frequency of installation and duration of treatment, could possibly lead to cataract. Patients being so treated should be examined carefully for signs of this complication developing.

Pharmaceutical precautions Diluent (for immediate use) – saline.

Legal category POM.

Package quantities 5 ml dropper bottles of 0.25% or 0.5% solution.

Further information Nil.

VISCLAIR* TABLETS

Presentation Visclair is a yellow sugar coated tablet containing 100 mg methylcysteine hydrochloride. The core is enteric coated to ensure absorption in the small intestine.

Uses Visclair is a systemically acting mucolytic with protective and healing properties.

The clinical effects of Visclair, is to liquify viscous or infected sputum, and to produce secretions of a more normal viscosity and volume. Reduction of cough and sputum is evident in patients responding to treatment.

Mucolytic action: The mucolytic action is in two phases. Firstly, because the sulphhydryl groups in VISCLAIR are a readily assimilable supply of sulphur, it can intervene in the synthesis of mucoproteins to produce mucus of a more normal viscosity. Secondly, as the tissue becomes saturated with the drug, the disulphide bonds uniting glucoprotein molecules can be severed, breaking down the mucin gel responsible for sputum viscosity.

Protection: Visclair has been shown, experimentally, to prevent desquamation of respiratory mucosa exposed to irritant vapours such as sulphur dioxide and carbon tetrachloride. In man there is some evidence for a similar therapeutic effect in chronic bronchitis.

Healing: The healing properties of cysteines are well established in cutaneous ulcers. Methylcysteine, an active constituent of Visclair has a predilection for mucosal tissue and provides additional sulphhydryl groups needed to accelerate the repair of damaged membranes in the bronchitic patient.

Indications: Chronic Bronchitis. Viscid or excess mucus secretions in upper/lower respiratory tract disorders, e.g. tracheostomies-bronchiectasis. As an adjunct in the management of upper respiratory tract disorder and bronchitis, e.g. chronic sinusitis and secretory otitis media.

Dosage and administration *Dosage: Adults:* 1 tablet three to four times daily before meals with a little water.

A rapid clinical effect can be achieved by giving tablets 4 times daily for the first 2 days of therapy.

The standard dose, 2 tablets three times a day, is given for 6 weeks and thereafter the dose should be reduced to 2 tablets twice daily.

Children over 5 years: one tablet three times daily.

Prophylactic Use: Prophylactic therapy is of benefit in some bronchitics, i.e., particularly those who show satisfactory response to short term therapy. Prophylactic therapy is best achieved by employing intermittent treatment. The dose is 1–2 tablets 2–3 times daily alternate days throughout the winter months. Prolonged treatment is essential.

Contra-indications, warnings, etc Visclair is well tolerated and serious toxic effects have not been reported. It is important that the tablets, which are enteric coated, should be swallowed whole.

Overdosage may cause excessive production of bronchial secretions and hence result in respiratory embarrassment. In such cases postural drainage and suction would be advisable.

In patients with tuberculosis sputum cultures should be carried out up to three months after cessation of therapy before assuming a negative result.

Patients should naturally be encouraged to cease smoking.

Treatment of overdosage: No specific toxic effects attributable to Visclair have been reported. Treatment should be directed to general supportive measures with induction of vomiting in conscious patients and a forced diuresis should be considered.

Pharmaceutical precautions *Storage:* Visclair tablets should be stored in a dry cool place.

Legal category P.

Package quantities Packs of 100 tablets.

Further information Nil.

Product licence number 0622/5003.

EPHY

Presentation 1-adrenaline base 1% in an isotonic buffered ophthalmic solution.

Uses For the treatment of primary open-angle and secondary glaucoma. It may be used in conjunction withotic or carbonic anhydrase inhibitor therapy.

Dosage and administration *Adults:* One drop instilled into the eye once or twice a day.

Children: At the discretion of the physician.

When used with pilocarpine or other miotics, Ephy could be instilled 5 to 10 minutes afterwards.

Contra-indications, warnings, etc Ephy should not be used where diagnosis of open-angle glaucoma has not been verified. It is contra-indicated in patients with narrow-angle because pupillary dilation may precipitate angle-closure glaucoma. Occasionally patients may complain of orbital discomfort or red eye. Rarely headache, irritation and local skin reactions may occur. As with other adrenaline preparations, melanosis may occasionally occur, but this has no pathological significance. Systemic effects are rare but can include tachycardia, extrasystoles and elevation of blood pressure.

Pharmaceutical precautions Ephy should not be used or dispensed from any container other than the original bottle. It should be stored, in its carton, in a cool place away from strong light. Ephy should not be used if the solution has become dark amber. Ephy should be discarded one month after opening. Ephy is fully potent for two years unopened.

Legal category P.

Package quantities Ephy is supplied as a sterile ophthalmic solution in a 7.5 ml bottle, with a separate sterile dropper.

Further information An air-excluding filling process of strict control of sterilisation ensure the long shelf-life of Ephy.

In common with other sympathomimetic agents Ephy does not affect accommodation.

Product licence number 0033/5022.

FLAMAZINE

Presentation A white hydrophilic cream containing silver sulphadiazine 1% w/w. The cream is a semi-solid in water emulsion. The silver sulphadiazine is in a fine crionised form.

Uses Topical burn treatment, and for the treatment of infected leg ulcers and pressure sores. It is particularly

effective against Gram-negative organisms such as *Pseudomonas aeruginosa*.

Dosage and administration Flamazine should be applied by means of a sterile spatula or a hand covered with a sterile glove in a layer approximately 3-5 mm thick.

In leg ulcers Flamazine should be applied followed by an absorbent gauze dressing and a support bandage, e.g. 10 cm Elastocrepe. Care should be taken not to spread Flamazine on to non-ulcerated skin, and it should not be used on very wet ulcers. The dressing should be changed at least three times a week and desloughing and cleansing carried out at the same time.

In the treatment of burns Flamazine should be applied every 24 hours.

Contra-indications, warnings, etc Teratology tests have been carried out in rabbits (Dutch-belted strain) and no evidence of teratogenicity has been found. Nevertheless the use of this drug during the first three months of pregnancy must be at the clinician's discretion. Further, because sulphonamide therapy is known to increase the incidence of kernicterus, silver sulphadiazine cream should be used with caution in pregnant females at term, in premature infants or in newborn infants during the first months of life.

Although reports of leucopenia following the use of Flamazine in the treatment of burns have been published, these reports do not appear to have been fully substantiated. However, in view of the reports it is as well to be aware of the possibility of low white blood cell counts occurring.

Sensitivity has been shown to occur but the incidence is lower than with other sulphonamides.

Flamazine should be used with caution if hepatic and/or renal function become impaired.

Pharmaceutical precautions The container should be stored in a cool place away from light. One container of Flamazine should be reserved for one patient; any remaining cream should be discarded after the completion of treatment.

Legal category POM.

Package quantities The preparation is obtainable in jars containing 250 g or 500 g and also tubes of 50 g.

Further information As well as its prophylactic effect, Flamazine may also exert a therapeutic action in wounds which are already infected. Flamazine is painless on application, does not cause electrolyte disturbance, is easy to apply and remove and does not stain.

Product licence number 0033/0056.

FLUORETS*

Presentation Sterile, individually wrapped paper strips each impregnated with 1 mg Fluorescein Sodium BP.

Uses Fluorescein is a corneal stain and can be used in diagnostic examinations, including Goldman tonometry and contact lens fitting.

Dosage and administration Pull tabs apart at right-hand end of envelope and withdraw Fluoret. Moisten tip with tear fluid from lower fornix, sterile water or sterile ophthalmic solution. Then gently stroke the Fluoret across the conjunctiva. For the best result the patient should blink several times.

Contra-indications, warnings, etc The applicator should be used once and then discarded. Care should be taken to handle the strip by the non-impregnated end only.

Pharmaceutical precautions No special precautions.

Legal category P.

Package quantities Gravity-delivered cartons of 100 individually wrapped Fluorets.

Further information Nil.

Product licence number 0033/5095.

GANDA*

Presentation Ganda is a clear, viscous, colourless to almost colourless liquid, available in four strengths.

Ganda 1+0.2 (Guanethidine monosulfate PhEur 1% w/v + Adrenaline BP 0.2% w/v)

Ganda 3+0.5 (Guanethidine monosulfate PhEur 3% w/v + Adrenaline BP 0.5% w/v)

Ganda 5+0.5 (Guanethidine monosulfate PhEur 5% w/v + Adrenaline BP 0.5% w/v)

Ganda 5+1 (Guanethidine monosulfate PhEur 5% w/v + Adrenaline BP 1% w/v)

in a buffered solution. It is supplied in a plastic dropper bottle packed in a nitrogen-filled pouch.

Uses For the treatment of primary open angle or secondary glaucoma. It may be used in conjunction with miotics or carbonic anhydrase inhibitor therapy.

Dosage and administration *Adult:* One drop to be instilled into the eye once or twice daily or at the discretion of the physician.

Children: At the discretion of the physician.

When used in conjunction with miotics, Ganda should follow the miotic after an interval of 5–10 minutes.

Contra-indications, warnings, etc Ganda should not be used in the case of a narrow angle between the iris and cornea as pupillary dilation may precipitate angle closure.

Occasionally a patient may complain of orbital discomfort or red eye (hyperaemia). Rarely, headache, irritation and local skin reactions may occur. As with other adrenaline preparations, melanosis may occasionally occur, but this has no pathological significance. Systemic effects are rare but can include tachycardia, extrasystoles, and elevation of blood pressure.

One clinical investigator has reported that in two cases out of 21, a paradoxical increase of I.O.P. occurred for which no explanation was offered.

Some degree of ptosis may represent an adverse effect in glaucoma, but will usually respond to a reduction in dosage or in the frequency of administration.

At prolonged high dosage a tendency to superficial punctate keratitis has been reported, responding either to a reduction in dosage or termination of treatment.

Pharmaceutical precautions Ganda is supplied in plastic dropper bottle in a nitrogen-filled pouch, inside a carton. It should be stored in its carton in a cool place away from strong light. The carton only should be removed before supplying to the patient. Ganda should not be diluted, nor should it be dispensed from a container other than the original bottle. Ganda should not be used if the solution has become dark amber. The contents of the bottle should be discarded one month after removal from the pouch. Ganda is fully potent for two years providing the pouch remains unopened.

Legal category POM.

Package quantities Ganda is supplied as a sterile ophthalmic solution in a 7.5 ml plastic dropper bottle. Each bottle is enclosed in a nitrogen-filled seal nylon/aluminium foil pouch inside a carton.

Further information The use of the nitrogen-filled overwrap ensures the long shelf-life of Ganda.

Ganda is a unique combination of Adrenaline BP and Guanethidine monosulfate PhEur in a plastic dropper bottle which has been specially designed for patient convenience. Its special formulation gives improved stability, and includes a viscosifier to enhance comfort and effectiveness.

In common with other sympathomimetic agents Ganda does not affect accommodation.

MINIMS* AMETHOCAINE HYDROCHLORIDE

Presentation Single-use, clear, colourless, sterile eye drops. Two strengths are available: Amethocaine (Tetracaine) Hydrochloride PhEur 0.5% and 1% w/v solution.

Uses As a topical anaesthetic.

Dosage and administration One drop or as required.

Contra-indications, warnings, etc Amethocaine may give rise to dermatitis in hypersensitive patients. Amethocaine is hydrolysed in the body to p-aminobenzoic acid and should not therefore be used in patients being treated with sulfonamides. On instillation an initial burning sensation may be complained of but this passes off in less than half a minute. The anaesthetised eye should be protected from dust and bacterial contamination. The cornea may be damaged by prolonged application of anaesthetic eye drops.

Each Minims unit should be discarded after a single use.

Pharmaceutical precautions Minims should be stored in a cool place, and should not be exposed to strong light.

Package quantities Cartons of 20 units, each unit containing approximately 0.5 ml.

Further information When applied to the conjunctiva benoxinate is less irritant than amethocaine in normal concentrations.

Product licence number 0033/5004.

MINIMS* CASTOR OIL

Presentation Single-use, clear, almost colourless or slightly yellow, viscous sterile eye drops.

Uses As a lubricant and emollient.

Dosage and administration One or two drops as required.

Contra-indications, warnings, etc Each Minims unit should be discarded after a single use.

Pharmaceutical precautions Minims should be stored in a cool place and should not be exposed to strong light.

Legal category P.

Package quantities Cartons of 20 units, each unit containing approximately 0.5 ml.

Further information Nil.

Product licence number 0033/5018.

MINIMS* CHLORAMPHENICOL

Presentation Single-use, clear, colourless, sterile eye drops, available as a 0.5% w/v solution of Chloramphenicol PhEur.

Uses As a topical antibacterial preparation. Chloramphenicol is a broad spectrum antibiotic with bacteriostatic activity and is effective against a wide range of Gram-negative and Gram-positive organisms.

Dosage and administration *Adult:* One or more drops as required.

Children: One drop as required.

Contra-indications, warnings, etc Treatment with chloramphenicol should be discontinued immediately on the appearance of toxic symptoms or allergic skin rashes.

Each Minims unit should be discarded after a single use.

Pharmaceutical precautions Chloramphenicol Minims should be stored at 5°C. Do not freeze.

Legal category POM.

Package quantities Cartons of 20 units, each unit containing approximately 0.5 ml.

Further information Nil.

Product licence number 0033/0055.

MINIMS* CYCLOPENTOLATE HYDROCHLORIDE

Presentation Single-use, clear, colourless, sterile eye drops. Two strengths are available: Cyclopentolate Hydrochloride BP 0.5% and 1% w/v solutions.

Uses As a mydriatic and cycloplegic.

Dosage and administration *Adult:* One or two drops as required. Maximum effect is induced 30–60 minutes after instillation. In iritis or iridocyclitis 1 or 2 drops of a 0.5% w/v solution are instilled every six to eight hours. One or two drops of a 0.5% w/v solution are also used for breaking down adhesions of the iris to the lens. For refraction the instillation of 1 drop of a 0.5% w/v solution repeated after five minutes is usually sufficient. Deeply pigmented eyes may require a 1% w/v solution.

Children: At the discretion of the physician.

Contra-indications, warnings, etc Recovery of accommodation occurs within 24 hours.

Use may precipitate a case of latent narrow angle glaucoma into an acute attack.

Each Minims unit should be discarded after a single use.

Pharmaceutical precautions Minims should be stored in a cool place, and should not be exposed to strong light.

Legal category POM.

Package quantities Cartons of 20 units, each unit containing approximately 0.5 ml.

Further information Nil.

MINIMS* FLUORESCEIN SODIUM

Presentation Single-use, clear, orange-red, sterile eye drops. Two strengths are available: Fluorescein Sodium BP 1% and 2% w/v solutions.

Uses As a diagnostic stain. Fluorescein does not stain a normal cornea, but corneal and conjunctival abrasions, or ulcers are stained a bright green and foreign bodies are surrounded by a green ring.

Dosage and administration Sufficient solution should be applied to stain the damaged areas. Excess may be washed away with sterile saline solution.

Contra-indications, warnings, etc Special care should be taken to avoid microbial contamination.

Each Minims unit should be discarded after a single use.

Pharmaceutical precautions Minims should be stored in a cool place, and should not be exposed to strong light.

Legal category P.

Package quantities Cartons of 20 units, each unit containing approximately 0.5 ml.

Further information *Pseudomonas aeruginosa* grows well in Fluorescein solutions, therefore a single use preparation is to be preferred.

Product licence numbers

Fluorescein Sodium 1% 0033/0079

Fluorescein Sodium 2% 0033/5008

MINIMS* GENTAMICIN SULFATE

Presentation Single-use, clear, colourless sterile eye drops containing Gentamicin Sulfate BP equivalent 0.3% w/v gentamicin base.

Uses As a broad-spectrum bactericidal antibiotic, the treatment of infections of the eye caused by both Gram-positive and Gram-negative organisms, including *Pseudomonas aeruginosa*.

Dosage and administration One drop or as required.

Contra-indications, warnings, etc Each Mini unit should be discarded after a single use.

Pharmaceutical precautions Minims should be stored in a cool place, and should not be exposed to strong light. Do not freeze.

Legal category POM.

Package quantities Cartons of 20 units, each unit containing approximately 0.5 ml.

Further information Nil.

Product licence number 0033/0094.

MINIMS* HOMATROPINE HYDROBROMIDE

Presentation Single-use, clear, colourless, sterile eye drops available as a 2% w/v solution of Homatropine Hydrobromide PhEur.

Uses As a mydriatic and cycloplegic.

Dosage and administration One drop or as required.

Contra-indications, warnings, etc As with atropine mydriatic there is a risk that it may precipitate latent narrow-angle glaucoma into an acute attack.

Each Minims unit should be discarded after a single use.

Pharmaceutical precautions Minims should be stored in a cool place, and should not be exposed to strong light.

Legal category POM.

Package quantities Cartons of 20 units, each unit containing approximately 0.5 ml.

Further information Homatropine Hydrobromide has properties similar to those of atropine and is often used in preference to the latter because its action is more rapid in onset and it has a less prolonged mydriatic action.

Product licence number

Homatropine Hydrobromide 2% 0033/5010

MINIMS* HYOSCINE HYDROBROMIDE

Presentation Single-use, clear, colourless, sterile eye drops, available as a 0.2% w/v solution of Hyoscine Hydrobromide PhEur.

Uses As a mydriatic and cycloplegic.

One drop or as required.

Product licence number 0033/5012.

MINIMS* PHENYLEPHRINE HYDROCHLORIDE

Presentation Single-use, clear, colourless, sterile eye
drops, available as a 10% w/v solution of Phenylephrine
(Metaxedrine) Hydrochloride BP.

Uses As a mydriatic agent.

Dosage and administration **Adult:** One drop as
required.

Children: The use of Minims phenylephrine in infants is
not recommended.

Contra-indications, warnings, etc As with any
mydriatic there is a risk that it may precipitate latent
narrow angle glaucoma into an acute attack.

Phenylephrine should not be used in patients with
thyrotoxicosis, hypertension, or cardiovascular problems
including tachycardia, and patients on β blockers.

Each Minims unit should be discarded after a single
use.

Pharmaceutical precautions Minims should be
stored in a cool place, and should not be exposed to
strong light.

Legal category P.

Package quantities Cartons of 20 units, each unit
containing approximately 0.5 ml.

Further information Nil.

Product licence number 0033/5021.

MINIMS* PILOCARPINE NITRATE

Presentation Single-use, clear, colourless, sterile eye
drops. Three strengths are available: Pilocarpine Nitrate
PhEur 1%, 2%, and 4% w/v solutions.

Uses As a miotic for reversing the action of the weaker
mydriatics and in emergency treatment of glaucoma.

Dosage and administration To induce miosis one or
two drops should be used. In cases of emergency
treatment of acute narrow angle glaucoma, one drop
should be used every five minutes until miosis is
achieved.

Contra-indications, warnings, etc Pilocarpine in-
duces spasm of the ciliary muscle which may last up to
two hours.

Each Minims unit should be discarded after a single use.

Pharmaceutical precautions Minims should be stored in a cool place, and should not be exposed to strong light.

Legal category POM.

Package quantities Cartons of 20 units, each unit containing approximately 0.5 ml.

Further information Nil.

Product licence numbers

Pilocarpine Nitrate 1% 0033/5013

Pilocarpine Nitrate 2% 0033/5014

Pilocarpine Nitrate 4% 0033/5016

MINIMS* PREDNISOLONE SODIUM PHOSPHATE

Presentation Single use clear colourless sterile eye drops, available as a 0.5% w/v solution of Prednisolone Sodium Phosphate BP.

Uses Non-infected inflammatory conditions of the eye.

Dosage and administration

Adult: One or two drops to be instilled as required.

Children: At the discretion of the physician.

Contra-indications, warnings, etc Use is contra-indicated in viral, fungal, tuberculous and other bacterial infections. Prolonged application to the eye of preparations containing corticosteroids has caused increased intra-ocular pressure and therefore the drops should not be used in patients with glaucoma. Topical administration of corticosteroids to pregnant animals can cause abnormalities of foetal development and although the relevance of this finding to human beings has not been established, topical steroids should not be used in large amounts or for prolonged periods during pregnancy.

In children, long-term continuous topical corticosteroid therapy should be avoided due to possible adrenal suppression.

Pharmaceutical precautions Minims should be stored in a cool place, and should not be exposed to strong light.

Legal category POM.

Package quantities Cartons of 20 units, each unit containing approximately 0.5 ml.

Further information Nil.

Product licence number 0033/0091.

MINIMS* ROSE BENGAL

Presentation Single-use, clear, dark-red, sterile eye drops, available as a 1% w/v solution of Rose Bengal.

Uses As a diagnostic stain. Rose Bengal solution stains degenerated conjunctival and corneal epithelial cells. It is particularly useful in demonstrating these changes in Sjogren's syndrome, where lack of tears has caused damage. Pressure marks from contact lenses are shown by Rose Bengal indicating that alteration of the lens may be necessary.

Dosage and administration One or two drops as required.

Contra-indications, warnings, etc Can produce severe stinging in dry eyes where it should be used with care.

Each Minims unit should be discarded after a single use.

Pharmaceutical precautions Minims should be stored in a cool place, and should not be exposed to strong light.

Legal category P.

Package quantities Cartons of 20 units, each unit containing approximately 0.5 ml.

Further information Nil.

Product licence number 0033/0048.

MINIMS* SODIUM CHLORIDE

Presentation Single-use, clear, colourless, sterile eye drops, available as a 0.9% w/v solution of Sodium Chloride PhEur.

Uses As an irrigating solution.

Dosage and administration Adequate solution should be used to irrigate the eye.

Contra-indications, warnings, etc Each Minims unit should be discarded after a single use.

Pharmaceutical precautions Minims should be stored in a cool place, and should not be exposed to strong light.

Legal category P.

Package quantities Cartons of 20 units, each unit containing approximately 0.5 ml.

Further information Nil.

Product licence number 0033/5017.

MINIMS* SULFACETAMIDE SODIUM

Presentation Single-use, clear, colourless, sterile eye drops, available as a 10% w/v solution of Sulfacetamide Sodium BP.

Uses For the treatment of conjunctivitis. Sulfacetamide sodium is active against both Gram-positive and Gram-negative organisms, and has a mucolytic effect.

Dosage and administration *Adult:* One drop or more as required.

Children: At the discretion of the physician.

Contra-indications, warnings, etc Local application to the eye may cause burning or stinging, but this is rarely severe enough to necessitate discontinuation of treatment. Sulfacetamide Sodium should not be used on persons who have shown hypersensitivity to sulfonamides.

Each Minims unit should be discarded after a single use.

Pharmaceutical precautions Minims should be stored in a cool place, and should not be exposed to strong light.

Legal category POM.

imine oxidase inhibitors,
ontinuation of treatment

It is wise to reduce dosage in the elderly, and in
hypothyroidism or chronic hepatic disease. Administra-
tion in labour may cause respiratory depression in the
new-born infant.

Care is required in the presence of renal insufficiency
or concurrent administration of other narcotic analgesics,
sedatives/hypnotics or anaesthetics.

At the commencement of dosage some patients may
experience a feeling of light-headedness or dizziness
which soon passes.

Nausea and vomiting may be troublesome although
emetic symptoms and constipation are less than with
other narcotic analgesics. If nausea and vomiting occur
anti-emetics such as those of the phenothiazine type
may be effective.

Pruritus and occasionally dryness of the mouth and
sweating have occurred. Hypotension is rare. As with
other narcotics respiratory depression, tolerance and
dependence may occur.

There is no, or inadequate, evidence of safety in human
pregnancy but the drug has been widely used for many
years without apparent ill consequence and animal
studies have not shown any hazard.

Treatment of overdose: Naloxone may be used as an
antidote to overdose or to antagonise any respiratory
depression that may occur.

Pharmaceutical precautions Protect from light.

Legal category POM, MDA.

Package quantities Tablets of 5 mg in containers of
25 and 100.

Further information Nil.

Product licence number 0033/5047R.

PRIMALAN*

Presentation White bi-convex tablets embossed Pri-
malan on one side, unmarked on reverse. Each tablet
contains 5 mg mequitazine.

Uses Antihistamine for the symptomatic treatment of
allergic conditions such as hay fever, vasomotor rhinitis,
urticaria, pruritus of allergic origin and allergic reactions
associated with insect bites and stings.

Dosage and administration *Adults:* One 5 mg tablet
to be taken orally twice a day.

Children: At present Primalan is not recommended for
children under the age of 12.

Contra-indications, warnings, etc Primalan should
not be given to patients sensitive to phenothiazines, or
given concurrently with monoamine oxidase inhibitors.
Primalan should not be administered during pregnancy.

Although Primalan has been found to cause less
drowsiness than other antihistamines of comparable
efficacy, patients should be warned not to take charge of
vehicles or machinery until it has been established that
sedation has not occurred. Primalan may also potentiate
the sedative effects of alcohol.

Primalan may potentiate sympathomimetic amines.

Dryness of the mouth and disturbance of visual
accommodation may occasionally occur particularly in
the early days of treatment.

Treatment of overdose: Gastric lavage and supportive
therapy. Avoid sedation with other phenothiazine
derivatives.

Pharmaceutical precautions Protect from light.

Legal category POM.

Package quantities Securitainers of 100 tablets.

Further information Primalan has a prolonged action, allowing adequate control with twice daily dosage.

Product licence number 0033/0090.

SIMPLENE®

Presentation Simplene is a clear, viscous, colourless to almost colourless liquid, containing Adrenaline BP in a buffered solution. It is supplied in a plastic dropper bottle packed in a nitrogen-filled pouch and is available in two strengths.

Simplene 0.5% (Adrenaline BP 0.5% w/v)

Simplene 1% (Adrenaline BP 1% w/v)

Uses For the treatment of primary open angle or secondary glaucoma. It may be used in conjunction with miotics or carbonic anhydrase inhibitor therapy.

Dosage and administration *Adult:* One drop to be instilled into the eye once or twice daily.

Children: At the discretion of the physician.

When used with pilocarpine or other miotics, Simplene should be instilled 5 to 10 minutes afterwards.

Contra-indications, warnings, etc Simplene should not be used when the diagnosis of open-angle glaucoma has not been verified. It is contra-indicated in patients with a narrow-angle because pupillary dilation may precipitate angle-closure. Occasionally patients may complain of orbital discomfort or red eye. Rarely, headache, irritation and local skin reactions occur. As with other adrenaline preparations, melanosis may occasionally occur, but this has no pathological significance. Systemic effects are rare but include tachycardia, extrasystoles, and elevation of blood pressure.

Pharmaceutical precautions Simplene is supplied in a plastic dropper bottle in a nitrogen-filled pouch, inside a carton. It should be stored in its carton in a cool place away from strong light. The carton only should be removed before supplying to the patient. Simplene should not be diluted, nor should it be dispensed from any container other than the original bottle. Simplene should not be used if the solution has become dark amber. The contents of the bottle should be discarded one month after removal from the pouch. Simplene is fully potent for 2 years providing the pouch remains unopened.

Legal category POM.

Package quantities Simplene is supplied as a sterile ophthalmic solution in a 7.5 ml plastic dropper bottle. Each bottle is enclosed in a nitrogen filled, double-sealed, nylon/aluminium foil pouch, inside a carton.

Further information The use of the nitrogen-filled overwrap ensures the long shelf-life of Simplene.

Simplene is a unique presentation of adrenaline in a plastic dropper bottle, which has been specially designed for patient convenience. Its special formulation gives improved stability, and includes a viscoliser to enhance comfort and effectiveness.

In common with other sympathomimetic agents Simplene does not affect accommodation.

Product licence numbers

Simplene 1.0% 0033/0057

Simplene 0.5% 0033/0072

SNO® PHENICOL

Presentation Multi-dose, colourless to pale straw coloured eye drops containing Chloramphenicol PhEu 0.5% w/v supplied in a plastic dropper bottle.

Uses As a topical antibacterial. Chloramphenicol is a broad spectrum antibiotic with bacteriostatic activity and is effective against a wide range of Gram-negative and Gram-positive organisms.

Dosage and administration *Adults:* One or more drops as required.

Children: One drop as required.

Contra-indications, warnings, etc This product is not intended as a long term treatment for dry eye syndromes.

Pharmaceutical precautions Sno phenicol should not be diluted or dispensed from any container other than the original bottle and should be stored at 5°C. Do not freeze.

Sno phenicol is fully potent for two years unopened.

Sno phenicol, like other eye drops, should be discarded one month after opening.

Legal category POM.

Package quantities Sno phenicol is supplied as a sterile ophthalmic solution in a 10 ml plastic dropper bottle.

Further information The solution is formulated with a viscoliser for patient comfort.

Product licence number 0033/0076.

SNO® PILO

Presentation Multi-dose, clear, colourless to pale yellow, eye drops supplied in a plastic dropper bottle. Five strengths are available: 0.5%, 1.0%, 2.0%, 3.0% and 4.0% w/v, Pilocarpine Hydrochloride BP.

Uses For the treatment of Glaucoma.

Dosage and administration *Adults:* One or two drops four times a day or as required.

Children: At the discretion of the physician.

Contra-indications, warnings, etc Sno pilo is contra-indicated where pupillary constriction is undesirable e.g. in cases of acute iritis.

Ciliary spasm with a temporary reduction of visual acuity occurs. Sensitivity is only rarely observed but if reaction occurs the use of the drops should be discontinued.

Pharmaceutical precautions Sno pilo should not be diluted or dispensed from any container other than the original bottle and should be stored in a cool place. Sno pilo is fully potent for three years unopened. Sno pilo like other eye drops, should be discarded one month after opening.

Legal category POM.

Package quantities Sno pilo is supplied as a sterile ophthalmic solution in a 10 ml plastic dropper bottle.

Further information The solution is formulated with viscoliser for patient comfort. Sno pilo is less acidic than most pilocarpine solutions.

Product licence numbers

no pilo 0.5% w/v 0033/0064
no pilo 1.0% w/v 0033/0065
no pilo 2.0% w/v 0033/0066
no pilo 3.0% w/v 0033/0067
no pilo 4.0% w/v 0033/0068

WELLDORM*

Presentation An elongated oval film-coated tablet. The coated tablet has a uniform smooth, film coat, of bluish-purple colour. Each tablet contains 650 mg of dichloralphenazone BP. The tablets are packed in blister strips.

Uses For the treatment of insomnia in all age groups; and for administration in the early stages of labour.

Dosage and administration *Adult dose:* The hypnotic dose is two or three 650 mg tablets to be taken with a drink 20 minutes before bedtime.

Paediatric dose: For children under the age of 12 Welldorm Elixir would provide an adequate dose range.

Contra-indications, warnings, etc Acute intermittent porphyria. An acute attack may be precipitated.

There have been occasional reports of skin rashes, nausea, vomiting, headache, hangover, anaphylaxis and occasional sensitivity reactions. Blood dyscrasias are extremely rare. Welldorm has been extensively used for over 20 years, during which time only one case of thrombocytopenia attributable to the drug has been reported.

A study has shown that withdrawal or omission of Welldorm therapy in patients receiving anticoagulant therapy with coumarin derivatives, e.g. warfarin, can lead to marked lengthening of the prothrombin time.

Treatment of overdosage: Gastric lavage and supportive therapy. In severe cases haemoperfusion should be used.

Pharmaceutical precautions The tablets should be stored in a cool dry place.

Legal category POM.

Package quantities The tablets are packed in blister strips of 15, two strips (30 tablets) per carton.

Further information Welldorm is a chloral hydrate derivative which induces a near natural sleep and does

not interfere with the paradoxical/orthodox (REM/Non-REM) ratio.

Product licence number 0033/0032.

WELLDORM* ELIXIR

Presentation Welldorm Elixir is a clear, red syrup, with a pleasant passion-fruit flavour. Welldorm Elixir contains 225 mg Dichloralphenazone BP in each 5 ml dose.

Uses Welldorm Elixir is for the treatment of insomnia in all age groups and for sedation in children.

Dosage and administration *Adult dose:* 15–45 ml as an hypnotic dose.

Children: Hypnotic:

Up to 1 year: 2.5–5 ml

1–5 years: 5–10 ml

6–12 years: 10–20 ml

Sedative: Sedative doses are half the above hypnotic dose (Syrup BP should be used as a diluent).

Contra-indications, warnings, etc Acute intermittent porphyria. An acute attack may be precipitated.

There have been occasional reports of skin rashes, nausea, vomiting, headache, hangover and occasional sensitivity reactions. Blood dyscrasias are extremely rare. Welldorm has been extensively used for over 20 years, during which time only one case of thrombocytopenia attributable to the drug has been reported.

A study has shown that withdrawal or omission of Welldorm therapy in patients receiving anticoagulant therapy with coumarin derivatives, e.g. warfarin, can lead to marked lengthening of the prothrombin time.

Treatment of overdosage: Gastric lavage and supportive therapy. In severe cases haemoperfusion should be used.

Pharmaceutical precautions Syrup BP should be used as a diluent. Welldorm Elixir should be stored in a well-stoppered bottle away from direct sunlight.

Legal category POM.

Package quantities Welldorm Elixir is supplied in bottles containing 150 ml and 500 ml.

Further information Welldorm Elixir is a chloral hydrate derivative which induces a near natural sleep and does not interfere with the paradoxical/orthodox (REM/Non-REM) ratio.

Product licence number 0033/5025.

SK&F

CENDEVAX* **Rubella vaccine, live BP** **(Cendehill* strain)**

Presentation Cendevax rubella vaccine is a live attenuated vaccine prepared in rabbit kidney cells. It is available in glass vials containing a pink freeze-dried pellet; a clear, colourless, sterile diluent is provided in a separate ampoule (monodose) or vial (10-dose). Each 0.5 ml of reconstituted vaccine contains not less than 1,000 TCID₅₀ of live attenuated Cendehill strain of rubella virus, together with not more than 25 µg (17 i.u.) neomycin sulphate.

Uses Routine immunisation of pre-pubertal girls against rubella. Also indicated in seronegative women of child-bearing age *who are not pregnant* and in whom the possibility of pregnancy can be excluded for at least three months following vaccination, including post-partum mothers, and for immunisation of children and adults to prevent transmission of rubella to the at-risk pregnant woman.

Dosage and administration *Adults and children:* 0.5 ml of the reconstituted vaccine administered by the subcutaneous route only.

The vaccine should be reconstituted using only the sterile diluent supplied with each dose. With multi-dose vials, the whole of the sterile diluent (7 ml) should be transferred into the vial containing the vaccine, keeping the latter upright. It should then be shaken to ensure complete solution. The syringe should be dry sterilised; the vaccine is readily inactivated by alcohol and other chemical disinfectants and antiseptics, and care is needed to avoid contact with these substances when sterilising syringes and skin before vaccination.

Contra-indications, warnings, etc

Contra-indications: **Never give to pregnant women, or to women of child-bearing age not fully aware of the need to avoid pregnancy for three months after vaccination**, since the vaccine virus may have an effect on the foetus.

Do not use in the presence of acute febrile illness, or in states of altered immunity which may accompany conditions such as leukaemia, lymphoma or generalised malignancy or treatment with corticosteroids, alkylating drugs, antimetabolites or irradiation. Do not give to those known to be hypersensitive to rabbit protein or fur or neomycin.

Cautions: While there is no evidence to indicate that the vaccine virus is transmissible to susceptible contacts, the theoretical possibility remains.

The possibility of interference from passive antibodies following administration of gamma globulin or anti-D immunoglobulin or blood transfusion should be borne in mind. Serum antibodies may be checked after three months.

It is not usually recommended that live vaccines be given within three weeks of each other.

Adverse reactions: Mild rash, slight temperature elevation and slight enlargement of the posterior cervic glands have been reported. Arthralgia, and less commonly arthritis, have occurred even more rarely an almost exclusively in adult women. These reactions have been mild and transient. Rare cases of myelodysplastic neuritis have been reported with rubella vaccines.

Overdosage: Not a problem.

Pharmaceutical precautions Protect from light. Reconstitute only with the diluent supplied. Although the vaccine should be used promptly after reconstitution it may when necessary be kept at a temperature between 2°C and 8°C for not longer than one hour before use. Cendevax rubella vaccine should be stored between 2°C and 8°C and should not be frozen (low temperatures will not harm the vaccine but may damage the diluent ampoule or vial).

Legal category POM.

Package quantities Monodose vials and 10-dose vials, each with a separate ampoule or vial containing 0.5 ml or 7 ml sterile diluent respectively.

Further information Because of possible interference from persisting maternal antibodies, there is little value in giving the vaccine to infants under one year of age.

While there is no evidence that vaccination during the incubation period of natural rubella will prevent the disease, there is no contra-indication to the use of the vaccine in these circumstances.

Product licence number 0002/5004.

DEXEDRINE* TABLETS

Presentation Half-scored, yellow tablets, marked SK&F, each containing 5 mg dexamphetamine sulphate.

Uses Dexedrine is a sympathomimetic amine with central stimulant and anorectic activity.

It is indicated in narcolepsy and in children with hyperkinetic states associated with minimal brain damage.

Dosage and administration *Adults:* In narcolepsy the usual starting dosage is 10 mg Dexedrine a day given in divided doses. Dosage may be increased necessary by 10 mg a day at weekly intervals to suggested maximum of 60 mg a day.

Children: In hyperkinetic states, the usual starting dosage for children aged 3-5 years is 2.5 mg a day, increased necessary by 2.5 mg at weekly intervals; for children aged 6 years and over, the usual starting dosage is 5 mg a day, increasing if necessary by 5 mg at weekly intervals. The usual upper limit is 20 mg a day, though some older children have needed 40 mg or more for optimal response.

Contra-indications, warnings, etc

Contra-indications: Do not use in patients known to be

tic amines, during, or for 14 in MAO inhibitor, in those , with symptomatic cardio- rate or severe hypertensive ig from hyperthyroidism or

n patients on guanethidine, ig may be antagonised by

competitive long-acting α - ist.

nagement of hypertensive aeo chromocytoma; and as ent of urinary retention due nign prostatic hypertrophy. laynaud's disease, and in

combination with other antihypertensive agents in the treatment of hypertension.

Dosage and administration *Adults:* The usual starting dose in all indications is 10 mg b.d.

In phaeochromocytoma this may be increased by 10 mg daily until control of hypertensive episodes is achieved, or postural hypotension occurs. Usually the dosage required is 1 to 2 mg/kg body weight daily in two doses. Concomitant β -adrenergic blockade may be necessary to control tachycardia and arrhythmias notably when tumours are secreting an appreciable amount of adrenaline as well as noradrenaline.

In urinary retention due to either neurogenic bladder or prostatic hypertrophy, 10 mg b.d. is usually sufficient. If no effect is seen after two to three weeks' treatment, alternative therapy should be used.

Children: There is little experience in children, but doses of 0.3 to 0.5 mg/kg body weight daily in neurogenic bladder, and 1 to 2 mg/kg daily in phaeochromocytoma have been used successfully.

Contra-indications, warnings, etc

Contra-indication: Do not use in patients with congestive heart failure.

Cautions: Use with great caution in patients in whom a fall in blood pressure and/or tachycardia may be undesirable, such as the elderly or those with severe heart disease, cerebrovascular disease or renal damage. The mode of action should be borne in mind if used concurrently with α -sympathomimetics or myocardial depressants.

Use in pregnancy: There is little evidence as to the safety of Dibenyline in pregnancy and it should not be used in pregnancy unless essential.

Adverse reactions: Side-effects are generally mild and transient, but may include postural hypotension with dizziness and compensatory tachycardia, nasal congestion, inhibition of ejaculation, miosis and lassitude. Gastro-intestinal upset has also been reported.

Overdosage: The main effect of overdosage is profound hypotension, which may last several hours, tachycardia and collapse. Treatment consists of the induction of vomiting and/or gastric lavage together with appropriate symptomatic and supportive measures. Treat hypotension with plasma expanders and the 'head down' position. Noradrenaline is of little value when α -adren- ergic receptors are blocked. Adrenaline should not be used since stimulation of β -adrenergic receptors will further decrease blood pressure.

Pharmaceutical precautions Store in a cool, dry place and dispense in moisture-proof containers.

Legal category POM.

Package quantities Containers of 100 and 500 capsules.

Further information In phaeochromocytoma treatment should be started as soon as possible after diagnosis, and time allowed for stabilisation of the condition before invasive investigations or operations are carried out. Operative cover with intravenous phenoxybenzamine may be given. In a few inoperable cases long-term treatment with Dibenyline has been used.

In urinary retention due to neurogenic bladder, response is more likely in patients with lower motor neurone lesions or who have shown a positive phentolamine test.

Product licence number 0002/5009.

DYAZIDE* TABLETS

Presentation Peach-coloured, half-scored, circular tablets bearing the mark SKF E93, each containing 50 mg triamterene and 25 mg hydrochlorothiazide.

Uses Dyazide is a potassium-conserving diuretic preparation with antihypertensive activity.

It is recommended for the control of oedema in cardiac failure, cirrhosis of the liver or the nephrotic syndrome, and in drug-induced and pre-menstrual oedema. It is also indicated in the treatment of mild to moderate hypertension, alone or in combination with other antihypertensive drugs.

Dosage and administration *Adults only: In oedema:* The usual starting dosage is 1 Dyazide tablet twice a day after meals. The optimal dosage may be 3 tablets a day, 2 after breakfast and 1 after lunch.

Maintenance dosage: Once a diuresis has been established, dosage should be reduced. Usually 1 tablet a day, or two tablets on alternate days will suffice.

In hypertension: Initially 1 tablet twice a day after meals, thereafter adjusted to the patient's needs. If Dyazide is added to already established therapy with another antihypertensive drug, the dosage of the latter should be reduced, and later adjusted if necessary. If another antihypertensive drug is added to Dyazide therapy, the dosage of the latter will not normally be reduced.

A dosage of 4 tablets a day should not be exceeded; at this level adverse reactions such as raised blood urea are more likely.

Contra-indications, warnings, etc

Contra-indications: Do not give Dyazide to patients with hyperkalaemia, progressive renal failure, or known hypersensitivity to either constituent of the product. Potassium supplements, or other potassium-conserving drugs, should not be given routinely with Dyazide.

Cautions: Use Dyazide with caution in patients with hepatic or renal insufficiency; in those predisposed to gout since both components can elevate uric acid levels; and in diabetic patients since thiazide diuretics can provoke hyperglycaemia and glycosuria.

After the first week, it is advisable to determine blood urea and serum potassium levels periodically, particularly in the elderly and those with renal insufficiency.

Thiazides reduce excretion of lithium and may thus precipitate intoxication.

Use in pregnancy and lactation: Dyazide has been in clinical use for a number of years, and there is no experimental or clinical evidence to suggest associated foetal abnormalities. Nevertheless, thiazides have been shown to pass through the placenta and also into breast milk. In rare instances, thrombocytopenia, pancreatitis or hypoglycaemia have been reported in newborn infants of mothers treated with thiazides. The use of Dyazide in pregnant or nursing mothers should therefore be avoided unless essential.

Adverse reactions: Nausea, vomiting, diarrhoea, muscle cramps, weakness, dizziness, headache, dry mouth and rash have been reported. Photosensitivity is rare.

Minor serum electrolyte changes have been observed infrequently, and marked fluctuations in serum potassium levels are uncommon. Metabolic acidosis occasionally occurs. Electrolyte imbalance may also indicate excessive dosage or be secondary to the condition under treatment.

In common with most diuretics, Dyazide may reduce glomerular filtration rate and cause a temporary increase

in blood urea levels; again this may also indicate excessive dosage or be secondary to the condition under treatment.

Acute interstitial nephritis, reversed on stopping treatment, has been reported very rarely.

Rare cases of thrombocytopenic purpura and megaloblastic anaemia have been reported with triamterene-thiazides alone have caused jaundice, acute pancreatitis and, rarely, blood dyscrasias including agranulocytosis, thrombocytopenia and leucopenia.

Overdosage: Symptoms of electrolyte imbalance, hypertension, gastro-intestinal disturbance and muscular weakness may occur. Treatment consists of the induction of vomiting and/or gastric lavage, correction of fluid depletion and electrolyte imbalance, and symptomatic and supportive therapy. If hypotension persists after adequate fluid replacement, dopamine may be used.

Pharmaceutical precautions No special storage precautions are required.

Legal category POM.

Package quantities Containers of 100 and 500 tablets.

Further information Triamterene may cause a blue fluorescence of the urine under certain light conditions.

Product licence number 0002/0050.

DYTAC* CAPSULES

Presentation Opaque, maroon-coloured capsule double-marked SKF, each containing 50 mg triamterene as a yellow, granular powder.

Uses Triamterene is a potassium-conserving diuretic thought to act by directly inhibiting the exchange of sodium for potassium and hydrogen in the distal renal tubule.

Dytac is recommended for the control of oedema in cardiac failure, cirrhosis of the liver or the nephrotic syndrome, and in drug-induced and pre-menstrual oedema. When Dytac is used as an adjuvant to potassium-depleting diuretics, such loss may be inhibited and diuresis enhanced.

Dosage and administration *Adults only:* When given alone, the usual dosage range is from 3 to a maximum of 5 Dytac capsules a day. The optimal daily dosage is capsules, given in divided doses after breakfast and at lunch. After the first week, treatment should preferably be given on alternate days to ensure satisfactory maintenance diuresis without an increase in blood urea levels. When given with another diuretic, lower dosages of both should be used initially.

Contra-indications, warnings, etc

Contra-indications: Do not give Dytac to patients with hyperkalaemia, progressive renal failure, or known hypersensitivity to the drug. Potassium supplements, or other potassium-conserving drugs, should not be given routinely with Dytac.

Cautions: Use Dytac with caution in patients with hepatic or renal insufficiency; in those predisposed to gout since Dytac has been shown in rare instances to elevate uric acid levels; and with hypotensive agents since an additive effect may result.

After the first week, it is advisable to determine blood urea and serum potassium levels periodically, particularly in the elderly and those with renal insufficiency.

been available since 1962, but no clinical evidence to date has been reported to the foetus. Nevertheless, it should be avoided in pregnancy unless it is clearly indicated in the first trimester.

Nausea, vomiting, diarrhoea, weakness, and minor decreases in blood urea have been reported. Photosensitivity

and hyponatraemia have been observed. Hypokalaemia has been observed in patients. Metabolic acidosis and electrolyte imbalance may also occur or be secondary to the

use of thiazides. Dytac may reduce the effect of thiazides and cause a temporary increase in blood urea. This may also indicate a secondary condition under

reversed on stopping treatment, rarely. Thrombocytopenic purpura and megalo-

cytopenia, electrolyte imbalance, especially. Gastro-intestinal disturbance and possibly hypotension may occur. Correction of the induction of

Store in a dry place, away from light.

Containers of 30 and 250

Triamterene may cause a blue fluorescence under certain light conditions. 0002/5014.

Each capsule with opaque, yellow, and red SKF, each containing 100 mg benzthiazide as a yellow,

Water-conserving diuretic preparation. It is used in cardiac failure, nephrotic syndrome, and in renal oedema.

Adults only: The optimal dose is 100 mg a day, 2 being taken after the first week, treatment on alternate days, to ensure response without an increase in blood urea. Dosage may be reduced to 50 mg a day, taken after breakfast

Indications, etc. Give Dytide to patients with renal failure, or known constituent of the product. Other potassium-conserving diuretics with Dytide.

Cautions: Use Dytide with caution in patients with hepatic or renal insufficiency; in those predisposed to gout since both components can elevate uric acid levels; with hypotensive agents, since an additive effect may result; and in diabetic patients since thiazides can provoke hyperglycaemia and glycosuria.

After the first week, it is advisable to determine blood urea and serum potassium levels periodically, particularly in the elderly and those with renal insufficiency.

Thiazides reduce excretion of lithium and may thus precipitate intoxication.

Use in pregnancy and lactation: Dytide has been available since 1963, and there is no experimental or clinical evidence to suggest associated foetal abnormalities. Nevertheless, thiazides have been shown to pass through the placenta and also into breast milk. In rare instances, thrombocytopenia, pancreatitis or hypoglycaemia have been reported in newborn infants of mothers treated with thiazides. The use of Dytide in pregnant or nursing mothers should therefore be avoided unless essential.

Adverse reactions: Nausea, vomiting, diarrhoea, muscle cramps, weakness, dizziness, headache, dry mouth, decreases in blood pressure, and rash have been reported. Photosensitivity is rare.

Minor serum electrolyte changes have been observed infrequently, and marked fluctuations in serum potassium levels are uncommon. Metabolic acidosis occasionally occurs. Electrolyte imbalance may also indicate excessive dosage or be secondary to the condition under treatment.

In common with most diuretics, Dytide may reduce glomerular filtration rate and cause a temporary increase in blood urea levels; again this may also indicate excessive dosage or be secondary to the condition under treatment.

Product licence number 0002/5015.

ESKAMEL* CREAM

Presentation A smooth, brown, non-greasy cream, which dries rapidly to a flesh colour when applied to the skin. It contains 2% w/w resorcinol and 8% w/w sulphur.

Uses Eskamel has mild antiseptic, keratolytic and exfoliative properties, and is indicated in the treatment of acne.

Dosage and administration *Adults and children:* Wash the affected areas with soap and water, and dry carefully. Apply Eskamel thinly to the skin with the fingers but do not rub in. Once a day is usually enough, but if the patient has a very oily skin, the cream may be applied more often. Eskamel may be used under make-up to mask the spots and lesions of acne.

Contra-indications, warnings, etc

Contra-indications: Do not use in patients who are sensitive to sulphur or resorcinol.

Cautions: Use with care on acutely inflamed areas or near the eyes.

Adverse reactions: Moderate erythema and scaling are the expected effects of Eskamel. If these are excessive or if inflammation occurs, stop treatment until the reaction has subsided, and then apply Eskamel less often.

Overdosage: If ingestion occurs, mild gastro-intestinal disturbance might occur. Treatment consists of rinsing out the mouth together with symptomatic measures if required.

Pharmaceutical precautions Store in a cool place. Keep in the original specially lined tubes to prevent evaporation.

Legal category P.

Package quantities Tubes containing 25 g.

Further information Nil.

Product licence number 0002/5000.

ESKORNADE* SPANSULE* CAPSULES
ESKORNADE* SYRUP

Presentation Clear, colourless capsules, grey-capped and filled with a mixture of red, grey and white pellets. Each Spansule sustained-release capsule contains 2.5 mg isopropamide present as the iodide, 50 mg phenylpropanolamine hydrochloride, and 5 mg diphenylpyraline hydrochloride. Two-thirds of the phenylpropanolamine and diphenylpyraline is formulated for sustained release over a period of six to eight hours.

A pale green syrup, greengage-flavoured, each 5 ml dose containing 0.75 mg isopropamide present as the iodide, 15 mg phenylpropanolamine hydrochloride, and 1.5 mg diphenylpyraline hydrochloride.

Uses Eskornade is a combination of an oral nasal decongestant, an antihistamine (H_1 -receptor antagonist) and an anticholinergic.

It is indicated in the relief of congestion and hypersecretion in the nasal cavity and paranasal sinuses, associated with the common cold, allergic rhinitis, acute and chronic rhinitis, sinusitis and influenza.

Dosage and administration *Adults:* One Eskornade Spansule capsule every 12 hours or two 5 ml doses of Eskornade syrup three times a day.

Children aged 2 to 6 years: One 2.5 ml dose of Eskornade syrup three times a day.

Children aged 7 years and over: One 5 ml dose three times a day.

Contra-indications, warnings, etc

Contra-indications: Do not use in patients with glaucoma, intestinal obstruction of organic origin or intestinal atony, severe ulcerative colitis, prostatic hypertrophy or incipient urinary retention from any cause, hypertensive

disease, severe heart disease, or hyperthyroidism; in those sensitive to iodine; or during, or for 14 days after treatment with an MAO inhibitor.

Cautions: Patients who drive or operate machinery should be warned of the possibility of drowsiness. Alcoholic drinks should be avoided. Administer with caution to patients with organic heart disease or angina of effort. The iodine present may interfere with some tests of thyroid function.

Use in pregnancy: Eskornade has been available since 1960, and there is no experimental or clinical evidence to suggest any associated hazard to the foetus. Nevertheless, drugs should be avoided in pregnancy unless essential, especially during the first trimester.

Adverse reactions: Blurred vision, dry mouth, urinary hesitancy or retention, constipation, palpitations, drowsiness or insomnia, and dizziness may occur.

Overdosage: Signs and symptoms may be related to any of the product's constituents and may include nausea and vomiting, irritability, convulsions, fever, tachycardia and arrhythmias. Absorption of phenylpropanolamine and diphenylpyraline from the sustained-release Spansule capsule is likely to be prolonged, and this should be borne in mind. Treatment consists of gastric lavage together with appropriate supportive and symptomatic measures. Central excitation or convulsions may require treatment with diazepam. Physostigmine salicylate 1–4 mg parenterally in an adult, repeated as necessary, has been reported to reverse the central and peripheral effects of anticholinergic poisoning. Excretion of phenylpropanolamine may be increased by forced acid diuresis.

Pharmaceutical precautions Store Spansule capsules in a cool, dry place, and dispense in moisture-proof containers. Store syrup in a cool place and dilute only with Syrup BP, after which it is stable for up to 14 days at room temperature.

Legal category P.

Package quantities Containers of 30 and 250 Spansule capsules. Bottles containing 150 ml syrup.

Further information Nil.

EXPANSYL* SPANSULE* CAPSULES

Presentation Clear, colourless capsules, black capped and filled with a mixture of blue, lime-green, and white pellets. Each Spansule sustained-release capsule contains 50 mg ephedrine sulphate, 2 mg trifluoperazine present as the hydrochloride and 5 mg diphenylpyraline hydrochloride. Two-thirds of the dose of ephedrine and diphenylpyraline is formulated for sustained release over a period of six to eight hours.

Uses Expansyl combines the properties of an adrenergic bronchodilator, a phenothiazine tranquilliser and an antihistamine (H_1 -receptor antagonist) for routine, prolonged protection against bronchospasm in chronic bronchitis and mild bronchial asthma; also for relief of mild asthmatic attacks.

Dosage and administration *Adults only:* 1 Expansyl Spansule capsule night and morning, increasing if necessary to a maximum of 3 capsules a day.

Indications, warnings, etc

Contra-indications: Do not use in patients with hyperactive disease, severe heart disease, or hyperthyroidism; or for 14 days after treatment with an MAO inhibitor; or in patients with existing blood dyscrasias or with liver damage.

Precautions: Use with caution in patients with organic heart disease or angina of effort, or with prostatic hypertrophy. Nausea and vomiting as a sign of organic disease may be masked by the anti-emetic action of trifluoperazine.

Common with other drugs acting on the CNS, amyl may affect ability to drive or operate machinery.

Use in pregnancy: Expansyl has been available since 1961, and there is no experimental or clinical evidence to suggest any associated hazard to the foetus. Nevertheless drugs should be avoided in pregnancy unless essential, especially during the first trimester.

Adverse reactions: Drowsiness, dizziness, restlessness, insomnia, dry mouth, blurred vision, palpitation, and constipation may occur.

Extrapyramidal symptoms due to trifluoperazine are very unlikely at the recommended dosage. Extremely rarely, long-term therapy with trifluoperazine in low dose has been associated with tardive dyskinesia, which can be long-lasting or even irreversible.

Overdosage: Signs and symptoms may be related to any of the product's constituents, but those of ephedrine would usually predominate. They may include nausea, vomiting, irritability, convulsions, fever, tachycardia, mydriasis, extrapyramidal symptoms and hypotension. Absorption of ephedrine and diphenylpyraline from the sustained-release Spansule capsule is likely to be prolonged and this should be borne in mind. Treatment consists of gastric lavage, together with appropriate supportive and symptomatic measures. Do not induce vomiting. Extrapyramidal symptoms may be treated with anticholinergic antiparkinsonism drugs. Treat hypotension with fluid replacement; if severe or persistent, adrenaline may be considered. Adrenaline is contraindicated. Excretion of ephedrine may be increased by acid diuresis.

Pharmaceutical precautions Store in a cool, dry place, protect from light, and dispense in moisture-proof containers.

Legal category POM.

Package quantities Containers of 30 and 250 Spansule capsules.

Further information Nil.

Product licence number 0002/5021.

FOL* SPANSULE* CAPSULES

Presentation Clear, colourless capsules, transparent, orange-capped and filled with a mixture of coral-red, pale yellow, and white pellets. Each Spansule sustained-release capsule contains 150 mg dried ferrous sulphate and 0.5 mg folic acid. Four-fifths of the dose of iron is specially formulated for sustained release over a period of several hours.

Uses Fefol is a haematinic preparation for prophylaxis of iron and folic-acid deficiency during pregnancy.

Dosage and administration *Adults only:* 1 Fefol Spansule capsule a day throughout pregnancy. Some pregnant patients may need a higher prophylactic dose of iron because of dietary or other factors.

Contra-indications, warnings, etc

Cautions and contra-indications: The folic acid content of one capsule a day is unlikely to mask pernicious anaemia should this condition be present; pregnancy during pernicious anaemia is very rare.

Iron chelates with tetracyclines, and absorption of both agents may be impaired.

Adverse reactions: Nausea and other gastro-intestinal symptoms sometimes encountered during iron therapy are unlikely to occur with Fefol Spansule capsules.

Overdosage: Symptoms of overdosage with iron salts include epigastric pain, nausea and vomiting, haematemesis and circulatory collapse. In severe cases, encephalopathy, acute hepatic necrosis and acute renal failure may develop after a latent period. The sustained-release Spansule capsule presentation of ferrous sulphate may delay excessive absorption of iron and allow more time for the initiation of appropriate counter-measures. Treatment consists of gastric lavage followed by the introduction of 5 g desferrioxamine into the stomach. Serum iron levels should be monitored and in severe cases intravenous desferrioxamine should be given together with supportive and symptomatic measures as required.

Pharmaceutical precautions Store in a cool, dry place, and dispense in moisture-proof containers.

Legal category POM.

Package quantities Pack containing 2 or 144 blister strips each of 14 Spansule capsules. Containers of 250 and 5,000 Spansule capsules.

Further information Fefol Spansule capsules are formulated to release most of the iron in the upper small intestine where absorption is greatest, and not in the stomach where gastric irritation may be caused.

Product licence number 0002/5022.

FEFOL-VIT* SPANSULE* CAPSULES

Presentation Clear, colourless capsules, opaque white-capped and filled with a mixture of coral-red, orange-yellow, pale yellow, and white pellets. Each Spansule sustained-release capsule contains 150 mg dried ferrous sulphate, 0.5 mg folic acid, 2 mg thiamine mononitrate, 2 mg riboflavin, 1 mg pyridoxine hydrochloride, 10 mg nicotinamide, 2.17 mg calcium pantothenate and 50 mg ascorbic acid. Four-fifths of the dose of iron is specially formulated for sustained release over a period of several hours.

Uses Fefol-Vit is a haematinic with added vitamins, for prophylaxis of iron and folic-acid deficiency during pregnancy, particularly when inadequate diet calls for supplementary vitamins B and C.

Dosage and administration *Adults only:* 1 Fefol-Vit Spansule capsule a day throughout pregnancy. Some pregnant patients may need a higher prophylactic dose of iron because of dietary and other factors.

Contra-indications, warnings, etc

Cautions and contra-indications: The folic acid content of one capsule a day is unlikely to mask pernicious anaemia should this condition be present; pregnancy during pernicious anaemia is very rare.

Iron chelates with tetracyclines, and absorption of both agents may be impaired.

Adverse reactions: Nausea and other gastro-intestinal symptoms sometimes encountered during iron therapy are unlikely to occur with Fefol-Vit Spansule capsules.

Overdosage: Symptoms of overdosage with iron salts include epigastric pain, nausea and vomiting, haematemesis and circulatory collapse. In severe cases, encephalopathy, acute hepatic necrosis and acute renal failure may develop after a latent period. The sustained-release Spansule capsule presentation of ferrous sulphate may delay excessive absorption of iron and allow more time for the initiation of appropriate counter-measures. Treatment consists of gastric lavage followed by the introduction of 5 g desferrioxamine into the stomach. Serum iron levels should be monitored and in severe cases intravenous desferrioxamine should be given together with supportive and symptomatic measures as required.

Pharmaceutical precautions Store in a cool, dry place, and dispense in moisture-proof containers.

Legal category POM.

Package quantities Containers of 30, 250 and 4,000 Spansule capsules.

Further information Fefol-Vit Spansule capsules are formulated to release most of the iron in the upper small intestine where absorption is greatest, and not in the stomach where gastric irritation may be caused.

Product licence number 0002/0049.

FEOSPAN* SPANSULE* CAPSULES

Presentation Clear, colourless capsules, ruby-red-capped and filled with a mixture of green and coral-red pellets. Each Spansule sustained-release capsule contains 150 mg dried ferrous sulphate. Four-fifths of the dose of iron is specially formulated for sustained release over a period of several hours.

Uses Feospan is a haematinic for the prevention and treatment of iron deficiency.

Dosage and administration *Adults:* 1 Feospan Spansule capsule a day. In more severe cases, 2 capsules a day may be required.

Children aged over 1 year: 1 capsule a day. The capsule may be opened and the pellets mixed with soft, cool food, but they must not be chewed.

Contra-indications, warnings, etc

Cautions and contra-indications: Iron chelates with tetracyclines, and absorption of both agents may be impaired.

Adverse reactions: Nausea and other gastro-intestinal symptoms sometimes encountered during iron therapy are unlikely to occur with Feospan Spansule capsules.

Overdosage: Symptoms of overdosage with iron salts include epigastric pain, nausea and vomiting, haematemesis and circulatory collapse. In severe cases, encephalopathy, acute hepatic necrosis and acute renal failure may develop after a latent period. The sustained-release Spansule capsule presentation of ferrous sulphate may delay excessive absorption of iron and allow more time for the initiation of appropriate counter-measures. Treatment consists of gastric lavage followed by the introduction of 5 g desferrioxamine into the stomach. Serum iron levels should be monitored and in severe cases intravenous desferrioxamine should be given together with supportive and symptomatic measures as required.

Pharmaceutical precautions Store in a cool, place, and dispense in moisture-proof containers.

Legal category P.

Package quantities Containers of 30, 250 and 5, Spansule capsules.

Further information Feospan Spansule capsules formulated to release most of the iron in the upper small intestine where absorption is greatest, and not in the stomach where gastric irritation may be caused.

Product licence number 0002/5023.

FESOVIT* SPANSULE* CAPSULES

Presentation Clear, colourless capsules, opaque low-capped and filled with a mixture of coral-orange-yellow, and white pellets. Each Spansule sustained-release capsule contains 150 mg dried ferrous sulphate, 2 mg thiamine mononitrate, 2 mg riboflavin, 1 mg pyridoxine hydrochloride, 10 mg nicotinic acid, 2.17 mg calcium pantothenate and 50 mg ascorbic acid. Four-fifths of the dose of iron is specially formulated for sustained release over a period of several hours.

Uses Fesovit is a haematinic with added vitamins, the prevention and treatment of iron deficiency, particularly in the elderly patient where inadequate diet calls for supplementary vitamins B and C.

Dosage and administration *Adults:* One Fesovit Spansule capsule a day. In more severe cases, 2 capsules a day may be required.

Children aged over 1 year: One Fesovit Spansule capsule a day. The capsule may be opened and the pellets mixed with soft, cool food, but they must not be chewed.

Contra-indications, warnings, etc

Cautions and contra-indications: Iron chelates with tetracyclines, and absorption of both agents may be impaired.

Adverse reactions: Nausea and other gastro-intestinal symptoms sometimes encountered during iron therapy are unlikely to occur with Fesovit Spansule capsules.

Overdosage: Symptoms of overdosage with iron salts include epigastric pain, nausea and vomiting, haematemesis and circulatory collapse. In severe cases, encephalopathy, acute hepatic necrosis and acute renal failure may develop after a latent period. The sustained-release Spansule capsule presentation of ferrous sulphate may delay excessive absorption of iron and allow more time for the initiation of appropriate counter-measures. Treatment consists of gastric lavage followed by the introduction of 5 g desferrioxamine into the stomach. Serum iron levels should be monitored and in severe cases intravenous desferrioxamine should be given together with supportive and symptomatic measures as required.

Pharmaceutical precautions Store in a cool, place, and dispense in moisture-proof containers.

Legal category P.

Package quantities Containers of 30, 250 and 5, Spansule capsules.

Further information Fesovit Spansule capsules formulated to release most of the iron in the upper small intestine where absorption is greatest, and not in the stomach where gastric irritation may be caused.

Product licence number 0002/0029.

HISTRYL* SPANSULE* CAPSULES HISTRYL* PAEDIATRIC SPANSULE* CAPSULES

Presentation Clear, colourless capsules, opaque pink-
ped and filled with a mixture of white and two shades
ink pellets in two strengths. Each Spansule sustained-
release capsule, size No. 2, contains 5 mg diphenylpy-
rine hydrochloride, and each paediatric Spansule
capsule, size No. 4, contains 2.5 mg diphenylpyraline
hydrochloride. Two-thirds of the dose of diphenylpyral-
ine is specially formulated for sustained release over a
period of six to eight hours.

Uses Histryl is an antihistamine (H_1 -receptor antag-
onist) for relief of allergic and vasomotor rhinitis, urticaria,
allergic oedema, allergic eczema, insect bites and
stings, food and drug allergy, and the urticarial and
dermatous lesions of serum sickness.

Dosage and administration *Adults:* 1 or 2 Histryl
capsules (5 mg) at night and morning. The higher
dose should be reserved for more severe conditions.

Children aged 7 years and over: 1 Histryl paediatric
capsule (2.5 mg) twice a day.

Contra-indications, warnings, etc

Precautions: Patients who drive or operate machinery
should be warned of the possibility of drowsiness.
Alcoholic drinks should be avoided.

Use in pregnancy: Histryl has been available since 1957,
but there is no experimental or clinical evidence to
suggest any associated hazard to the foetus. Neverthe-
less, drugs should be avoided in pregnancy unless
essential, especially during the first trimester.

Adverse reactions: Drowsiness, dryness of the mucous
membranes, dizziness and blurred vision may occasion-
ally occur.

Overdosage: Symptoms of overdosage may include
nausea and vomiting, and effects of CNS excitation
and/or depression including coma. Absorption of di-
phenylpyraline from the sustained-release Spansule
capsule is likely to be prolonged and this should be borne
in mind. Treatment consists of the induction of vomiting
and/or gastric lavage together with symptomatic and
supportive measures.

Pharmaceutical precautions Store in a cool, dry
place, and dispense in moisture-proof containers.

Legal category P.

Package quantities Both strengths in containers of
10 and 250 Spansule capsules.

Other information Nil.

Histryl paediatric Spansule capsules	0002/5032

KERECID* OPHTHALMIC OINTMENT KERECID* OPHTHALMIC SOLUTION

Presentation An off-white, translucent ophthalmic
ointment containing 0.5% w/w idoxuridine.

Uses Clear, colourless and odourless aqueous ophthalmic
solution containing 0.1% w/v idoxuridine, together with
0.2% w/v thiomersal.

Pharmacology Kerecid is an antiviral agent active against herpes
simplex virus and certain other DNA viruses. It is
indicated in herpes simplex keratitis, particularly in acute

dendritic ulcers; infections with stromal involvement
may respond less favourably.

Dosage and administration *Adults and children:*
Kerecid ophthalmic ointment: Apply approximately
every 4 hours, five times a day, with the last dose at
bedtime. The ointment should be placed inside the
conjunctival sac of the infected eye.

Kerecid ophthalmic solution: Initially 1 drop instilled into
the eye every hour during the day and every two hours
at night. Do not administer more often than hourly. When
a definite improvement is seen, shown by a loss of
corneal staining with fluorescein, reduce dosage to 1
drop every two hours during the day and every four
hours at night. For best results the dosage schedule must
be followed closely.

To minimise recurrences, continue treatment for three
to five days after healing appears to be complete, that is,
after complete loss of corneal staining with fluorescein.
Treatment should not usually be continued for more than
21 days.

Observe patients frequently during treatment. Im-
provement in dendritic keratitis and other superficial
infections is generally seen within a week, but may
occasionally occur much earlier. If superficial infections
show no sign of improvement after seven to eight days,
alternative treatment is indicated. A faint dendritic
pattern in the deeper epithelial layers that neither stains
nor produces symptoms may persist for two to four
weeks. This does not indicate failure of treatment or a
need for continued therapy.

Antibiotics may be used to control secondary infec-
tions; and atropine preparations may be given if needed.
Do not, however, mix Kerecid ophthalmic solution with
these adjuvant medications.

Contra-indications, warnings, etc

Contra-indications: Do not administer boric acid during
treatment as it may cause irritation in the presence of
Kerecid.

Cautions: Caution is required with concomitant use of
topical corticosteroids which may encourage the spread
of viral infection. They should not be used in the presence
of active corneal ulceration, but may be considered
when the stromal disease seriously affects vision, or
when oedema or uveitis is present. Kerecid should be
continued for several days after corticosteroid treatment
has been completed.

Use in pregnancy: One isolated study has indicated that
idoxuridine may have embryotoxic effects in rabbits, but
these effects were not confirmed in extensive repeat
studies. Other work has shown very high parenteral
doses to be embryotoxic in mice and rats. Kerecid has
been available since 1963 and no other experimental or
clinical evidence of any associated hazard to the foetus
has emerged. While local application to the eye is
unlikely to produce significant levels within the body,
Kerecid should not be administered in pregnancy unless
essential, especially during the first trimester.

Adverse reactions: Transient irritation and pain on
administration may occur; itching, inflammation, oedema
and, rarely, allergic reactions and occlusions of the
lacrimal puncta, have been reported.

Overdosage: Excessive use may damage the corneal
epithelium. Toxic effects are unlikely to follow ingestion.

Pharmaceutical precautions Store ophthalmic oint-
ment in a cool place. Store ophthalmic solution below
8°C but do not freeze. The contents are sterile until the

pack is opened; discard any unused contents one month after opening.

Legal category POM.

Package quantities Ophthalmic ointment in tubes of 5 g. Ophthalmic solution in polythene bottles with integral dropper, each containing 15 ml.

Further information Nil.

Kerecid ophthalmic solution 0002/5035

LISSONUM*

Presentation White, oblong, film-coated tablets, with convex faces and a breakline on both sides, each containing 450 mg lithium carbonate (12.2 mmol Li^+) in controlled-release form.

Uses Lissinum is a controlled-release tablet, designed to reduce fluctuations in serum lithium levels and the likelihood of adverse reactions.

It is indicated for the treatment of acute episodes of mania or hypomania and for the prophylaxis of recurrent manic-depressive illness.

Dosage and administration *Adults only:* Lissinum should be given twice a day.

Treatment of acute mania or hypomania: Patients should be started on one or one and a half tablets twice a day. Dosage should then be adjusted to achieve a serum lithium level of 0.8 to a maximum of 1.5 mmol/l. Serum concentration of lithium should be measured after four to seven days' treatment and then at least once a week until dosage has remained constant for 4 weeks. When the acute symptoms have been controlled, recommendations for prophylaxis should be followed.

Prophylaxis: The usual starting dosage is one tablet twice a day. Dosage should then be adjusted until a serum level of 0.5 to 1.0 mmol/l is maintained. Serum concentration of lithium should be measured after four to seven days' treatment and then every week until dosage has remained constant for four weeks. Frequency of monitoring may then be gradually decreased to a minimum of once every two months.

Blood samples for measurement of serum lithium concentration should be taken just before a dose is due and not less than 12 hours after the previous dose.

Levels of more than 2 mmol/l must be avoided.

Tablets may be halved but should not be chewed or broken up.

The full prophylactic effect of lithium may not be evident for 6 to 12 months, and treatment should be continued through any recurrence of the illness.

Contra-indications, warnings, etc

Contra-indications: Do not use in patients with impaired renal function, cardiac disease, or untreated hypothyroidism. Lithium should not be given to patients with low body sodium levels, including, for example, dehydrated patients, those on low sodium diets, or those with Addison's disease.

Cautions: Vomiting, diarrhoea, intercurrent infection and drugs likely to upset electrolyte balance, such as diuretics, may all reduce lithium excretion and thereby precipitate intoxication; reduction of dosage may be required. In elderly patients, lithium excretion may also

be reduced. An anti-diuretic effect leading to water retention has been reported following the use of diuretics during treatment with lithium salts. There is a possibility of water intoxication and lithium intoxication with diuretics and lithium salts are co-prescribed. The possibility of hypothyroidism and of renal dysfunction arises during prolonged treatment should be borne in mind.

There have been reports of interaction between lithium and some neuroleptics, particularly haloperidol at high dosages.

Use in pregnancy and lactation: Lithium crosses placental barrier. In animal studies, lithium has been reported to interfere with fertility, gestation and foetal development. There is epidemiological evidence that drug may be harmful in human pregnancy. Lithium therapy should not be used during pregnancy, especially during the first trimester, unless the benefits are considered to outweigh the risks. If given, however, serum levels should be measured frequently because of changes in renal function associated with pregnancy and parturition.

Since lithium is secreted in breast milk, bottle feed is advisable.

Adverse reactions: At therapeutic serum levels, nausea and diarrhoea, fine tremor of the hands, muscle weakness, vertigo, giddiness, weight gain, oedema, and a dazed feeling may occur. Hypothyroidism has been reported. Rarely hyperthyroidism may occur. Mild polyuria and polydipsia are not infrequent and, occasionally nephrogenic diabetes insipidus may be present. Reactions have been observed on biopsy in some patients but the relationship between these lesions and renal function has not been established.

Skin reactions including acne or acneiform eruptions, papular skin disorders, rashes, and exacerbation of psoriasis have been reported.

Intoxication: Vomiting, diarrhoea, drowsiness, lack of co-ordination and/or a coarse tremor of the extremities and lower jaw may occur, especially with serum levels above the therapeutic range. Ataxia, blurred vision, dysarthria, tinnitus, muscle hyperirritability, choreoathetoid movements and toxic psychosis have also been described.

If any of the above symptoms appear, treatment should be stopped immediately and arrangements made for serum lithium measurement.

Overdosage: Symptoms are similar to those listed above under *Intoxication* but more marked, particularly the central nervous system origin. In severe cases seizures, coma and death may ensue.

Treatment consists of the induction of vomiting and gastric lavage together with supportive and symptomatic measures. Particular attention should be paid to maintenance of fluid and electrolyte balance and of adequate renal function. Where convulsions are present, diazepam may be used. Forced alkaline diuresis, peritoneal dialysis or haemodialysis may help eliminate the lithium ion. The latter method is preferable, particularly where serum lithium exceeds 4 mmol/l.

Pharmaceutical precautions Store in a dry place

Legal category POM.

Package quantities Boxes containing 60 tablets or blister packs. Securitainers containing 1,000 tablets.

Further information Nil.

Product licence number 0002/0083.

CRALAX* MICRO-ENEMA

Presentation A disposable plastic tube with a 2-inch ble plastic nozzle, which contains 5 ml of a colourless ous liquid incorporating 450 mg sodium citrate, mg sodium alkylsulphoacetate and 5 mg sorbic acid, ether with glycerin, sorbitol and purified water.

es Micralax combines the action of sodium citrate, 'septising' agent which can displace bound water sent in the faeces; sorbitol, which enhances this on; and sodium alkylsulphoacetate, a wetting agent. Micralax is indicated whenever an enema is necessary relieve constipation: in dyschezia, especially in lidden patients; in geriatrics, paediatrics and obstet-; and in preparation for X-ray examination, proctos-ry and sigmoidoscopy.

sage and administration *Adults and children d 3 years and over:* Administer the contents of one :ro-enema rectally, inserting the full length of the zle.

o lubricant is needed as a drop of the mixture is ficient.

ontra-indications, warnings, etc

ontra-indication: Do not use in patients with inflam- tory bowel disease.

verse reactions: No side-effects have been reported. ressive use may cause diarrhoea and fluid loss, which uld be treated symptomatically.

armaceutical precautions Store in a cool place.

gal category P.

ckage quantities Packs of 12 and 100.

rther information Nil.

oduct licence number 0002/5037.

URO PHOSPHATES* LIQUID

esentation A clear, green liquid with a weak oholic odour and a bitter taste, each 10 ml dose ntaining 179.3 mg calcium glycerophosphate, 1.4 mg sodium glycerophosphate, and 1.1 mg ychnine alkaloid (in acid solution), together with % w/w alcohol.

ies As a tonic during convalescence and in the lerly and debilitated patient.

sage and administration *Adults:* 10 ml Neuro osphates twice a day, taken in water preferably before als.

ildren aged 7 years and over: 5 ml twice a day, as ove.

ontra-indications, warnings, etc

utions: As Neuro Phosphates contains strychnine, discriminate use may be dangerous, especially in the lerly patient.

verse reactions: No side-effects are to be expected at e recommended dosage.

er dosage: Even in gross overdosage, symptoms are e. Treatment consists of the induction of vomiting d/or gastric lavage together with appropriate support- and symptomatic measures. If muscular spasms or er symptoms of excitability are present, give nothing mouth and do not induce vomiting. The patient should ept absolutely quiet and sedation with diazepam ay be indicated.

Pharmaceutical precautions Neuro Phosphates may be diluted if necessary with purified water. It is stable after dilution for up to 14 days at room temperature.

Legal category POM.

Package quantities Bottles of 300 ml and 2 litres.

Further information Nil.

Product licence number 0002/5039.

PARNATE* TABLETS

Presentation Geranium-red, sugar-coated tablets, marked SKF, each containing 10 mg tranlylcypromine present as the sulphate.

Uses Parnate is a non-hydrazone monoamine oxidase inhibitor for the treatment of depression. It is not recommended for mild depressive states resulting from temporary situational difficulties.

Dosage and administration *Adults only:* Initially, one tablet morning and afternoon. If the response is not adequate after the first week, add a further tablet at midday, and continue for at least a week. A dosage of 3 tablets a day should only be exceeded with caution. When a satisfactory response has been obtained, dosage may be reduced to a maintenance level, often of 1 tablet a day.

When given with a tranquilliser, the dosage of Parnate is not affected. When given concurrently with electro-convulsive therapy, the usual dosage is 1 tablet twice a day during the series and 1 tablet a day afterwards as maintenance therapy.

Contra-indications, warnings, etc

Contra-indications: Do not give Parnate less than a week after stopping treatment with any other anti-depressant drug including other MAO inhibitors, because of persisting effects, then give half the usual dosage for the first week. Similarly, after stopping Parnate, allow at least two weeks to elapse before starting treatment with any drug that may interact.

Do not give Parnate with indirectly-acting sympatho-mimetic amines such as amphetamine, fenfluramine or similar anti-obesity agents, ephedrine or phenylpropan-olamine (certain 'cold-cures' may contain such agents), or with levodopa or dopamine, as severe hypertensive reactions may result; with pethidine and closely related narcotic analgesics as potentiation may occur; or with other MAO inhibitors, as symptoms of overdosage are possible.

Reports of hyperactivity, hypertonicity, hyperpyrexia, coma and death have been associated with the use of Parnate in combination with tricyclic anti-depressants; tetracyclic antidepressants should also be avoided. The use of clomipramine in patients already on Parnate may be particularly hazardous.

Do not use Parnate in patients with actual or suspected cerebrovascular disease or severe cardiovascular disease; in those with actual or suspected pheochromocytoma, or with hyperthyroidism; or in those with known liver damage or blood dyscrasias.

Dietary precautions: High levels of tyramine in certain foods have been the cause of severe hypertensive reactions in patients on MAO inhibitor therapy (see *Adverse reactions*). Accordingly, patients must be warned to avoid the following: matured cheeses, hydro-lysed protein extracts such as Marmite or Bovril, alcoholic

drinks, particularly red wines such as Chianti, and protein foods that are not fresh or whose preparation involved hydrolysis, fermentation, pickling, or 'hanging'; also broad-bean pods, which contain levodopa, and banana skins.

Cautions: Caution should be exercised when giving Parnate with the following: guanethidine, as its action may be antagonised; reserpine, as hyperactivity may occur; methyl dopa, as central excitation may result; other hypotensive agents because of possible additive effects; oral hypoglycaemic agents or insulin, as their action may be potentiated; anticholinergic antiparkinsonism drugs, as potentiation has been reported; narcotic analgesics, except pethidine which is contra-indicated (see above), because of possible potentiation; and carbamazepine, which has similarities with tricyclic antidepressants. Although the effects of barbiturates may be enhanced, and this possibility should be borne in mind, they have frequently been given with Parnate, particularly at night. Metrizamide should be avoided in patients on MAO inhibitors since they may lower the seizure threshold.

Patients should be specifically asked if they are taking any other medication because of the possibility of drug interactions.

Use Parnate with great caution in elderly patients; in those with cardiovascular disease in whom physical activity should be regulated, as the drug may suppress anginal pain; and in epileptic patients, as tranylcypromine has a variable effect on the convulsive threshold in animals. Parnate may aggravate some co-existing symptoms in depression such as anxiety and agitation. Parnate should preferably be withdrawn at least two weeks before elective surgery because of possible drug interaction.

Caution should be exercised in prescribing Parnate for patients with a previous history of dependence on drugs or alcohol.

In common with other drugs acting on the CNS, Parnate may affect ability to drive or operate machinery.

Use in pregnancy and lactation: Do not use in pregnancy, especially during the first and last trimesters, unless there are compelling reasons. There is no evidence as to drug safety in human pregnancy nor is there evidence from animal work that it is free from hazard. Tranylcypromine passes into the milk of lactating dogs.

Adverse reactions: Severe hypertensive reactions may occur, notably in association with foods containing tyramine (see *Dietary precautions*). Such reactions may be presaged by palpitations and unusually frequent headaches; patients should be warned to discontinue the drug if such symptoms occur. As well as a rapid rise in blood pressure, severe occipital headache, which may radiate frontally, is virtually always present, and pain and stiffness in the neck are usual; other features include multiple extrasystoles, often with bradycardia though sometimes with tachycardia, other arrhythmias, substernal pain, nausea and vomiting, sweating, pallor, sometimes followed by flushing, mydriasis and photophobia. Rarely, hypotension may dominate the clinical picture. ECG changes may be seen. The symptoms can mimic subarachnoid haemorrhage or may actually be associated with intracranial bleeding. Exceptionally, hemiparesis, hemiplegia or death has resulted.

Severe hypertensive reactions should be treated at once by reducing the blood pressure; slow intravenous injection of 5 mg phentolamine mesylate should be effective. Injectable or oral chlorpromazine is suitable for

milder reactions. Acute symptoms generally subside within 24 hours.

Insomnia is the most frequent side-effect; it may usually be overcome by giving the last dose of the drug not later than 3 pm, by reducing dosage, or by prescribing a mild hypnotic.

Mild headache, drowsiness, weakness, dizziness, palpitation, transient restlessness, dry mouth, blurred vision, nausea, oedema, weight gain, increased appetite, a rash have been reported. Overstimulation, including anxiety and agitation, developing rarely into hypomania has also been observed; the dosage should be reduced. Hypotension, which may be postural, may occur; it is usually temporary, but if it persists the drug should be stopped.

Dependence on Parnate, with tolerance to very high doses, has been reported rarely. This should be distinguished from the return of features of the original illness on cessation of treatment.

Liver dysfunction has occurred very rarely, and isolated instances of purpura and blood dyscrasias have been reported.

Overdosage: Signs and symptoms are usually of the type already described as adverse reactions, but may be much more intense, may include hyperpyrexia, tremor and convulsions, and may follow a latent period. Treatment consists of the induction of vomiting and/or gastric lavage together with supportive and symptomatic measures. External cooling is recommended for hyperpyrexia. Treatment of hypotension with fluid replacement; if severe or persistent, noradrenaline may be considered. Hypertension, if it occurs, may be relieved by slow intravenous injection of phentolamine mesylate. Beta-adrenergic receptor blockade has been used successfully.

Pharmaceutical precautions Store in a cool, dry place, and dispense in moisture-proof containers.

Legal category POM.

Package quantities Containers of 50 and 500 tablets.

Further information It is generally considered that no particular hazard is attached to the use of local anaesthetics containing small amounts of adrenaline in patients receiving Parnate unless cardiovascular disease is present.

Product licence number 0002/5040.

PARSTELIN* TABLETS

Presentation Leaf-green, sugar-coated tablet marked SKF, each containing 10 mg tranylcypromine present as the sulphate and 1 mg trifluoperazine present as the hydrochloride.

Uses Parstelin is a combination of a non-hydrizir monoamine oxidase inhibitor and a phenothiazine tranquilliser, for the treatment of depression complicated by anxiety. It is not recommended for mild depressive states resulting from temporary situational difficulties.

Dosage and administration *Adults only:* Initially, tablet morning and afternoon. If the response is not adequate after the first week, add a further tablet at midday, and continue for at least a week. A dosage of tablets a day should only be exceeded with caution. When a satisfactory response has been obtained, dosage may be reduced to a maintenance level, often of 1 tablet a day.

Contra-indications, warnings, etc

Contra-indications: Do not give Parstelin less than a week after stopping treatment with any other antidepressant drug including other MAO inhibitors, because of persisting effects, then give half the usual dosage for the first week. Similarly, after stopping Parstelin, allow at least two weeks to elapse before starting treatment with any drug that may interact.

Do not give Parstelin with indirectly-acting sympathomimetic amines such as amphetamine, fenfluramine, or other anti-obesity agents, ephedrine or phenylpropanamine (certain 'cold-cures' may contain such agents), with levodopa or dopamine, as severe hypertensive reactions may result; with pethidine and closely related narcotic analgesics, as potentiation may occur; or with other MAO inhibitors, as symptoms of overdosage are possible.

Reports of hyperactivity, hypertonicity, hyperpyrexia, coma and death have been associated with the use of tricyclic antidepressants in combination with tricyclic antidepressants; tetracyclic antidepressants should also be avoided. The use of clomipramine in patients already on Parstelin may be particularly hazardous.

Do not use Parstelin in patients with actual or suspected cerebrovascular disease or severe cardiovascular disease; in those with actual or suspected pheochromocytoma, or with hyperthyroidism; or in those with existing blood dyscrasias or known liver damage.

Dietary precautions: High levels of tyramine in certain foods have been the cause of severe hypertensive reactions in patients on MAO inhibitor therapy (see *Adverse reactions*). Accordingly, patients must be warned to avoid the following: matured cheese, hydrolysed protein extracts such as Marmite or Bovril, alcoholic drinks, particularly red wines such as Chianti, and protein foods that are not fresh or whose preparation involved hydrolysis, fermentation, pickling, or 'hanging'; also ad-bean pods, which contain levodopa, and banana skins.

Precautions: Caution should be exercised when giving Parstelin with the following: guanethidine, as its action may be antagonised; reserpine, as hyperactivity may occur; methylodopa, as central excitation may result; other hypotensive agents because of possible additive effects; oral hypoglycaemic agents or insulin, as their action may be potentiated; anticholinergic antiparkinsonism drugs, as potentiation has been reported; narcotic analgesics, except pethidine which is contra-indicated (see above), because of possible potentiation; and imipramine, which has similarities with tricyclic antidepressants. Although the effects of barbiturates may be enhanced, and this possibility should be borne in mind, they have frequently been given with Parstelin, particularly at night. Metrizamide should be avoided in patients on MAO inhibitors since they may lower the seizure threshold.

Patients should be specifically asked if they are taking any other medication because of the possibility of drug interactions.

Use Parstelin with great caution in elderly patients; in those with cardiovascular disease in whom physical activity should be regulated, as tranylcypromine may suppress anginal pain; and in epileptic patients as tranylcypromine has a variable effect on the convulsive threshold in animals. Tranylcypromine may aggravate some co-existing symptoms in depression such as anxiety and agitation. Parstelin should preferably be

withdrawn at least two weeks before elective surgery because of possible drug interaction.

Nausea and vomiting as a sign of organic disease may be masked by the anti-emetic action of trifluoperazine.

Caution should be exercised in prescribing Parstelin for patients with a previous history of dependence on drugs or alcohol.

In common with other drugs acting on the CNS, Parstelin may affect ability to drive or operate machinery.

Use in pregnancy and lactation: Do not use in pregnancy, especially during the first and last trimesters, unless there are compelling reasons. There is no evidence as to drug safety in human pregnancy nor is there evidence from animal work that it is free from hazard. Both tranylcypromine and trifluoperazine pass into the milk of lactating dogs.

Adverse reactions: Severe hypertensive reactions may occur, notably in association with foods containing tyramine (see *Dietary precautions*). Such reactions may be presaged by palpitations and unusually frequent headaches; patients should be warned to discontinue the drug if such symptoms occur. As well as a rapid rise in blood pressure, severe occipital headache, which may radiate frontally, is virtually always present, and pain and stiffness in the neck are usual; other features include multiple extrasystoles, often with bradycardia though sometimes with tachycardia, other arrhythmias, substernal pain, nausea and vomiting, sweating, pallor, sometimes followed by flushing, mydriasis and photophobia. Rarely, hypotension may dominate the clinical picture. ECG changes may be seen. The symptoms can mimic subarachnoid haemorrhage or may actually be associated with intracranial bleeding. Exceptionally, hemiparesis, hemiplegia or death has resulted.

Severe hypertensive reactions should be treated at once by reducing the blood pressure; slow intravenous injection of 5 mg phentolamine mesylate should be effective. Injectable or oral chlorpromazine is suitable for milder reactions. Acute symptoms generally subside within 24 hours.

Insomnia is the most frequent side-effect; it may usually be overcome by giving the last dose of the day not later than 3 pm, by reducing dosage, or by prescribing a mild hypnotic.

Mild headache, drowsiness, weakness, dizziness, palpitation, transient restlessness, dry mouth, blurred vision, nausea, oedema, weight gain, increased appetite and rash have been reported. Overstimulation, including anxiety and agitation, developing rarely into hypomania, has also been observed; the dosage should be reduced. Hypotension, which may be postural, may occur; it is usually temporary, but if it persists the drug should be stopped.

Dependence on tranylcypromine, with tolerance to very high doses, has been reported rarely. This should be distinguished from the return of features of the original illness on cessation of treatment.

Extrapyramidal symptoms due to the trifluoperazine component are very unlikely at the recommended dosage. Extremely rarely, long-term therapy with trifluoperazine in low dosage has been associated with tardive dyskinesia, which can be long-lasting or even irreversible.

Liver dysfunction has occurred very rarely, and isolated instances of purpura and blood dyscrasias have been reported.

Overdosage: Signs and symptoms are usually of the type already described as adverse reactions to tranylcypromine.

ine, but may be more intense, may include hyperpyrexia, tremor and convulsions, and may follow a latent period. In the unlikely event of symptoms from the trifluoperazine component, these are extrapyramidal in type. Treatment consists of gastric lavage together with supportive and symptomatic measures. Do not induce vomiting. External cooling is recommended for hyperpyrexia. Treat hypotension with fluid replacement; if severe or persistent, noradrenaline may be considered; adrenaline is contraindicated. Hypertension, if it occurs, may be relieved by slow intravenous injection of phentolamine mesylate. Beta-adrenergic receptor blockade has been used successfully.

Pharmaceutical precautions Store in a cool, dry place, protect from light, and dispense in moisture-proof, light-resistant containers.

Legal category POM.

Package quantities Containers of 50 and 500 tablets.

Further information It is generally considered that no particular hazard is attached to the use of local anaesthetics containing small amounts of adrenaline in patients receiving tranylcypromine unless cardiovascular disease is present.

Product licence number 0002/5041.

PHENOBARBITONE SPANSULE* CAPSULES

Presentation Clear, colourless capsules, blue-capped and filled with a mixture of dark blue, pale blue, and white pellets, in two strengths. Each Spansule sustained-release capsule, size No. 3, contains 60 mg, and each size No. 2 capsule, 100 mg phenobarbitone. Two-thirds of the dose is formulated for sustained release over a period of six to eight hours.

Uses Anticonvulsant and sedative, Phenobarbitone Spansule capsules are indicated in the treatment of epilepsy.

Dosage and administration *Adults:* Dosage depends on the need of the individual patient, and may vary from one 60 mg capsule a day in the morning or at night, to three 100 mg capsules a day.

Children aged 6 years and over: As in adults, the dosage requirement may vary, the highest usual dosage being two 60 mg capsules a day. The capsules may be opened and the pellets mixed with soft, cool food, but they must not be chewed.

Contra-indications, warnings, etc

Contra-indications: Do not use in patients with porphyria, severe liver damage, or known hypersensitivity to barbiturates.

Cautions: Patients who drive or operate machinery should be warned of the possibility of drowsiness. Patients should also be warned that alcohol may potentiate the effects of phenobarbitone. The drug should be used with care in the elderly, and in those with kidney or liver damage.

Because phenobarbitone can induce liver microsomal enzymes, the rate of metabolism of certain drugs can be increased. Those drugs whose expected effect may be reduced in this way include coumarin-type anticoagulants and some steroid hormones.

Prolonged use may lead to dependence of the barbiturate-alcohol type, and particular care should be

taken in treating patients with a history of dependence on drugs or alcohol.

Use in pregnancy and lactation: It has been suggested that certain anticonvulsants, possibly including phenobarbitone, may produce embryotoxic effects in man. Although this drug has been available for very many years, it should be avoided in pregnancy unless essential, especially during the first trimester.

Barbiturates can pass into breast milk and should be avoided by nursing mothers.

Adverse reactions: Drowsiness, which may be marked, and allergic reactions including skin reactions, may occur. Paradoxically in children irritability may be observed.

Overdosage: Absorption of phenobarbitone from the sustained-release Spansule capsule is likely to be prolonged, and this should be borne in mind. Treatment consists of the induction of vomiting and/or gastric lavage, together with intensive supportive and symptomatic measures. In severe poisoning, forced alkaline diuresis, haemodialysis or charcoal haemoperfusion may help to eliminate the drug.

Pharmaceutical precautions Store in a cool, dry place, and dispense in moisture-proof containers.

Legal category POM.

Package quantities Both strengths in containers of 30 and 250 Spansule capsules.

Further information Nil.

Phenobarbitone Spansule capsules 100 mg	0002/504

POLIOMYELITIS VACCINE, LIVE (ORAL) BP (Sabin strains)

Presentation Poliomyelitis Vaccine, Live (Oral) BP as supplied by Smith Kline & French, is a light orange to pink liquid stabilised with molar magnesium chloride. Each dose (3 drops) provides at least 10^6 TCID₅₀ type (LS-c, 2ab), 10^5 TCID₅₀ type 2 (P712, Ch, 2ab) and $10^{5.5}$ TCID₅₀ type 3 (Leon 12a, b) live attenuated strain of poliomyelitis virus grown in monkey kidney cell cultures, and contains not more than 7 µg (5 i.u.) neomycin sulphate.

Uses Active immunisation against poliomyelitis.

Dosage and administration *Adults and children:* For oral use only: NOT FOR INJECTION. Three drops of the vaccine constitute one dose which may be given with syrup or on a lump of sugar to mask the bitter salty taste of the magnesium chloride.

For a complete schedule, three doses of the vaccine should be given at intervals of at least four weeks (see also *Further information*).

Other unvaccinated members of the same household (including adults) should be advised vaccination at the same time as the vaccinee.

Contra-indications, warnings, etc

Contra-indications: The vaccine should not be used in the presence of acute febrile illness or intercurrent infection, diarrhoea, vomiting or other gastro-intestinal disturbance, neither should it be given in the presence of

mpaired immune response including leukaemia, lymphoma, generalised malignancy or treatment with corticosteroids, cytotoxic drugs or irradiation. Do not give to those known to be hypersensitive to neomycin (see also *Cautions*).

Cautions: The vaccine may contain trace amounts of penicillin and streptomycin which should not contraindicate its use except in those with extreme hypersensitivity to either antibiotic.

It is not normally recommended that live vaccines are given within three weeks of each other.

Use in pregnancy: Pregnant women should not be given oral poliomyelitis vaccine unless they are at definite risk from poliomyelitis.

Adverse reactions: Paralysis temporally associated with vaccination has been reported very rarely in recipients or contacts.

Overdosage: Not applicable.

Pharmaceutical precautions Protect from light and store between 2°C and 6°C. Under these conditions there is no significant loss of virus titre for 12 months.

Once opened, the vaccine should be used within three hours or discarded. Any unopened vaccine should be returned to storage between 2°C and 6°C as soon as possible. Potency is maintained for two weeks at room temperature (20°C to 25°C).

Legal category POM.

Package quantities Ten-dose vial with dropper.

Further information Current policy recommends that the first dose of oral poliomyelitis vaccine should be given at three months of age. The first and second doses should be separated by six to eight weeks and the second and third doses by four to six months. For convenience the vaccine may be given at the same time as the three-dose basic course of diphtheria/tetanus/pertussis vaccine.

It is currently recommended that a reinforcing dose of poliomyelitis vaccine should be given at school entry and at 15 to 19 years of age. Adults need not be offered a reinforcing dose unless they are at special risk.

Product licence number 0002/0076.

PRAGMATAR* OINTMENT

Presentation A pale, buff-coloured, oil-in-water cream containing 4% w/w cetyl alcohol-coal tar distillate, 3% w/w precipitated sulphur, and 3% w/w salicylic acid.

Uses Pragmatar has mild antipruritic, antiseptic, and keratolytic properties. It is indicated in the treatment of dandruff, other seborrhoeic conditions, and common scaly skin disorders.

Dosage and administration *Adults and children:* For mild dandruff, apply the ointment once a week when the hair is washed. For more severe cases, treat the entire scalp daily at bedtime, applying lightly but thoroughly with the fingertips. The ointment can be washed out the next morning or left as a pleasant hair dressing. For other indicated subacute or chronic skin disorders, apply daily in small quantities to affected areas only.

For use in infants, the ointment may be diluted by mixing with a few drops of water in the palm of the hand.

Contra-indications, warnings, etc

Contra-indications: Do not use in patients who are sensitive to sulphur.

Caution: Use with care near the eyes, the groin, or on acutely inflamed areas. If any ointment should accidentally enter the eye, flush with normal saline solution.

Adverse reactions: No side-effects are to be expected if the ointment is used according to directions. Excessive use, however, may cause erythema and irritation.

Overdosage: If ingestion occurs, gastro-intestinal disturbances may follow. Treatment consists of rinsing out the mouth together with symptomatic measures if necessary. Even with massive ingestion, salicylate poisoning seems unlikely.

Pharmaceutical precautions Store in a cool place and protect from light.

Legal category P.

Package quantities Tubes containing 25 g.

Further information Nil.

Product licence number 0002/5044.

REDEPTIN* INJECTION

Presentation Each ampoule or vial of Redeptin contains an opalescent white aqueous suspension containing 2 mg fluspirilene in each 1 ml.

Uses Fluspirilene is a major tranquilliser of the diphenylbutylpiperidine group with a mildly alerting action. It is slowly absorbed after intramuscular injection. Detectable blood levels are reached within four hours of injection, and the antipsychotic action usually lasts for about a week, with a range of 5 to 15 days.

Redeptin is recommended for the treatment of schizophrenia, and has proved especially useful for maintenance therapy. It is of particular value in patients who are unreliable in taking oral medication.

Dosage and administration *Adults only:* The recommended starting dose is 2 mg a week by deep intramuscular injection; this may be increased by 2 mg a week according to response. The maintenance dosage for most patients is from 2 to 8 mg a week, but some may require up to 12 mg a week. Dosage should not exceed 20 mg a week.

Administration: Before administration the container should be shaken well. The 6 ml vial should be used on one occasion only.

Contra-indications, warnings, etc

Contra-indications: Do not use in patients who have suffered uncontrollable adverse effects during previous treatment with diphenylbutylpiperidine derivatives.

Cautions: Patients who drive or operate machinery should be warned of the possibility of drowsiness.

Patients with epilepsy should be treated with caution as attacks may be precipitated.

Use in pregnancy: Although there is no evidence from animal studies to suggest that Redeptin has embryotoxic effects, drug treatment should always be avoided during pregnancy unless essential, especially during the first trimester.

Adverse reactions: When side-effects occur, they are usually limited to the first two days after injection. Extrapyramidal reactions, especially dyskinesia and ak-

athisia but also tremor and salivation, may occur within 6 to 12 hours after injection and usually disappear within 48 hours; they can normally be controlled by reduction of dosage or by the use of anticholinergic antiparkinsonism drugs. The possibility of tardive dyskinesia should be borne in mind. Subcutaneous nodules at the site of injection have been reported, usually in patients on high doses for long periods. These nodules tend to disappear when treatment is stopped. They may be minimised by using as many different injection sites as possible. Other reactions reported include fatigue, upper gastro-intestinal symptoms such as nausea and vomiting, drowsiness, insomnia, restlessness, excitement, anxiety, headache and sweating. There have also been occasional reports of blurred vision, mild hypotension, dizziness, rash, and EEG and ECG changes. In a small number of patients side-effects may become progressively more marked over a period of weeks or months; these signs of accumulation can be eliminated by omitting one injection every four or five weeks.

Overdosage: In the unlikely event of accidental overdosage, signs and symptoms are likely to be predominantly extrapyramidal, possibly with some excitation. Treatment would consist of supportive and symptomatic measures. Extrapyramidal symptoms should be treated with an anticholinergic antiparkinsonism drug. The long-acting properties of the presentation should be borne in mind.

Pharmaceutical precautions Redeptin ampoules and vials should be stored upright at room temperature and protected from light.

Legal category POM.

Package quantities Redeptin ampoules, each containing either 2 mg fluspirilene in 1 ml or 6 mg fluspirilene in 3 ml, are available in boxes of 10. Redeptin vials, each containing 12 mg fluspirilene in 6 ml, are available in packs of 5.

Further information Nil.

Product licence number 0002/0056.

RIMEVAX*

Measles vaccine, live BP (Schwarz strain)

Presentation Rimevax Measles Vaccine, prepared in chicken embryo fibroblasts, is presented as a pink freeze-dried pellet in a glass vial with a separate ampoule of clear, colourless, sterile diluent. Each 0.5 ml dose of reconstituted vaccine contains not less than 1,000 TCID₅₀ of the highly attenuated live Schwarz strain measles virus and not more than 25 µg (17 i.u.) of neomycin sulphate.

Uses Rimevax is indicated for active immunisation against measles (rubeola).

If given to contacts within three days of exposure to measles, the full clinical disease may be suppressed.

Dosage and administration *Adults and children:* 0.5 ml of the reconstituted vaccine subcutaneously or intramuscularly. The vaccine should be reconstituted using the sterile diluent provided.

The vaccine is quickly inactivated by ether, alcohol and detergents and care should be taken to avoid contact with these substances when cleaning skin prior to vaccination. Syringes need to be dry sterilised.

Contra-indications, warnings, etc

Contra-indications: Do not use Rimevax in the presence of acute illness, whether active or expected following exposure to infection other than measles. This applies particularly to active tuberculosis and respiratory tract infection. It is also contra-indicated in states of altered immunity including those which may accompany conditions such as leukaemia, lymphoma, generalised malignancy or treatment with corticosteroids, cytotoxic drug or irradiation.

Rimevax may contain traces of chick embryo protein but this does not normally contra-indicate its use except in cases of severe hypersensitivity to eggs. Rimevax should not be given to those known to be hypersensitive to neomycin. A solution of 1:1000 adrenaline should be available for injection in rare cases of anaphylactic reaction.

Do not use during pregnancy.

Cautions: Measles vaccine should only be given to children with a history of convulsions with the simultaneous administration of human normal immunoglobulin [recommended dosage 1.3 mg protein/kg (0.6 mg protein/lb) body weight]. In such children or those with a family history of convulsions, consideration should be given to delaying immunisation until after the second birthday.

Because of the possibility of interference from passive antibodies, measles vaccine should not normally be given to infants below the age of one year, or to subjects who have received blood or human plasma transfusions or human immunoglobulin within the previous three months. If the vaccine is given in these circumstances serum antibodies should be checked at a later date.

Tuberculin testing should be delayed for about eight weeks after measles vaccination since false-negative results may be obtained during this period.

It is not usually recommended that live vaccines be given within three weeks of each other.

Adverse reactions: These are usually mild and are more likely around the eighth day after vaccination. They may include rash, malaise, cough, pharyngitis, coryza, pyrexia and headache. In a very few subjects convulsions may accompany the fever. Very rarely encephalitis has been reported in association with measles vaccination.

Pharmaceutical precautions Protect from light. Rimevax Measles Vaccine should be stored between 2°C and 8°C and should not be frozen (lower temperatures will not harm the vaccine but may damage the diluent ampoule). At room temperature (20°–25°C) Rimevax is stable for up to four weeks.

The vaccine should be reconstituted using the sterile diluent provided. Once reconstituted Rimevax should be used immediately and certainly within one hour.

Legal category POM.

Package quantities Single-dose vials, each with a separate ampoule containing sterile diluent, singly and in packs of 50.

Further information Current policy recommends routine vaccination against measles for children between 1 and 2 years of age. Rimevax may also be used for older children and adults known to be susceptible to measles.

The following groups of children at special risk may in particular benefit from vaccination: children from the age of one year upwards in residential care; those entering nursery school or other establishments accepting chil-

ren for day care; those with chronic conditions affecting physical development such as cystic fibrosis or congenital heart disease; and those with a history of convulsions provided the appropriate cautions (see *Cautions* above) are observed.

Maximum periods of stability of freeze-dried Rimevax:

2°-8°C	2 years
0°-25°C	4 weeks
7°C	14 days
1°C	7 days

It is recommended that the vaccine is stored at 2°-8°C (see *Pharmaceutical precautions*).

Product licence number 0002/0088.

KEFRON* AEROSOL FOR LOCAL APPLICATION

Presentation A volatile, non-inflammable liquid consisting of 15% w/w dichlorodifluoromethane and 5% w/w trichlorofluoromethane, in a pressurised canister.

Uses When applied to the skin as a jet. Skefron exerts local chilling effect. It is used for external treatment of painful conditions associated with muscle spasm, as in lumbago, fibrositis, torticollis and sprains.

Dosage and administration *Adults and children:* Hold container upright between 1 and 2 feet from the affected area, and press button firmly so that a jet and not a spray is produced. If the face is treated, screen the eyes, nostrils and mouth. Direct the jet horizontally at the area for three to five seconds, and repeat after half a minute. A third application may be given after a further half minute if necessary. This constitutes one treatment. Not more than three such treatments should be given in any one day. There may be a brief increase in pain before relief occurs.

Contra-indications, warnings, etc

Contra-indications: Do not use on inflamed or broken skin.

Adverse reactions: No side-effects are to be expected when Skefron is used according to directions.

Overdosage: Excessive use may damage the skin. Inhalation may cause choking and coughing but prevention of further inhalation and symptomatic treatment should be adequate.

Pharmaceutical precautions Store in a cool place. Do not puncture, break or incinerate containers even when apparently empty.

Legal category GSL.

Package quantities Canisters each containing 200 g.

Further information Nil.

Product licence number 0002/5071.

STELABID* TABLETS

STELABID* FORTE TABLETS

Presentation *Stelabid tablets:* Dull yellow, sugar-coated tablets, marked SKF in grey, each containing 5 mg isopropamide present as the iodide and 1 mg trifluoperazine present as the hydrochloride.

Stelabid Forte tablets: Dull yellow, sugar-coated tablets,

marked SKF and P92 in light grey, each containing 7.5 mg isopropamide present as the iodide and 2 mg trifluoperazine present as the hydrochloride.

Uses Stelabid is a combination of two long-acting compounds, an anticholinergic agent and a phenothiazine tranquilliser. It is indicated in the symptomatic treatment of peptic ulcer, and other gastro-intestinal disorders in which hypersecretion and/or painful spasms are a problem as, for example, in irritable or spastic colon and functional diarrhoea. Stelabid is especially indicated when such conditions are complicated by emotional factors such as tension and anxiety.

Dosage and administration *Adults only:* *Stelabid tablets:* 2 or 3 tablets a day, according to the severity of the condition. The dosage should be divided and taken in the morning and at bedtime. At the higher dosage, and particularly in patients troubled by night pain, 2 tablets may be taken at bedtime.

Stelabid Forte tablets: 1 tablet every 12 hours.

Contra-indications, warnings, etc

Contra-indications: Do not use in patients with glaucoma, intestinal obstruction of organic origin or intestinal atony, reflux oesophagitis, prostatic hypertrophy or incipient urinary retention from any cause, or ulcerative colitis; in those sensitive to iodine; or in patients with existing blood dyscrasias or known liver damage.

Cautions: Care should be exercised when treating elderly patients or those with cardiovascular disease.

Patients who drive or operate machinery should be warned of the possibility of drowsiness.

The iodine present may interfere with some tests of thyroid function.

Nausea and vomiting as a sign of organic disease may be masked by the anti-emetic action of trifluoperazine.

Use in pregnancy: Combinations of isopropamide and trifluoperazine have been available since 1960, and there is no experimental or clinical evidence to suggest any associated hazard to the foetus. Nevertheless, drugs should be avoided in pregnancy unless essential, especially during the first trimester.

Adverse reactions: Blurred vision, mydriasis, dry mouth, restlessness, insomnia, urinary hesitancy or retention, constipation, tachycardia, palpitations, and drowsiness may occur.

Extrapyramidal symptoms due to the trifluoperazine component are very unlikely at the recommended dosage. Extremely rarely, long-term therapy with trifluoperazine in low dosage has been associated with tardive dyskinesia, which can be long-lasting or even irreversible.

Overdosage: Signs and symptoms may be those of either isopropamide or trifluoperazine, or both, and may include extrapyramidal symptoms, CNS depression and hypotension. Treatment consists of gastric lavage, together with symptomatic and supportive measures. Do not induce vomiting. Central excitation may require a sedative such as diazepam. Physostigmine salicylate, 1-4 mg parenterally in an adult, repeated as necessary, has been reported to reverse the central and peripheral effects of anticholinergic poisoning. Extrapyramidal symptoms may be treated with an anticholinergic antiparkinsonism drug. Treat hypotension with fluid replacement; if severe or persistent, noradrenaline may be considered. Adrenaline is contra-indicated.

Pharmaceutical precautions Store in a cool, dry place, protect from light, and dispense in moisture-proof, light-resistant containers.

Legal category POM.

Package quantities *Stelabid tablets*: Containers of 100 and 500 tablets.

Stelabid Forte tablets: Containers of 100 tablets.

Further information Nil.

STELAZINE* TABLETS

STELAZINE* SPANSULE* CAPSULES

STELAZINE* SYRUP

STELAZINE* CONCENTRATE

STELAZINE* INJECTION

Presentation Blue, sugar-coated tablets, marked SKF, containing either 1 mg or 5 mg trifluoperazine present as the hydrochloride.

Clear, colourless capsules, opaque yellow-capped and filled with a mixture of dark and light blue and white pellets. Each Spansule capsule, size No. 4, contains 2 mg, size No. 2, 10 mg, and size No. 1, 15 mg trifluoperazine present as the hydrochloride. Two-thirds of the dose of trifluoperazine is formulated for release over a period of six to eight hours.

A clear, pale yellow, peach-flavoured syrup, each 5 ml dose containing 1 mg trifluoperazine present as the hydrochloride.

A clear, pale yellow, peach-flavoured concentrate with a bitter numbing after-taste. Before dilution, each 1 ml of concentrate contains 10 mg trifluoperazine present as the hydrochloride.

Ampoules containing 1 mg trifluoperazine present as the hydrochloride in 1 ml.

Uses Stelazine is a piperazine phenothiazine tranquiliser with potent antipsychotic, anxiolytic, and anti-emetic activity.

Low dosage: Stelazine is indicated in anxiety states, depressive symptoms secondary to anxiety, and in senile agitation and confusion. It is also indicated in the symptomatic treatment of nausea and vomiting.

High dosage: Stelazine is indicated in acute and chronic schizophrenia of all types, psychosis due to organic brain damage, toxic psychosis, and behaviour disorders in mental subnormality.

Dosage and administration *Adults: Low dosage:* 2–4 mg a day as tablets or syrup, given in divided doses, or one or two 2 mg Spansule capsules a day, according to the severity of the patient's condition. If necessary, dosage may be increased to 6 mg a day, but above this level extrapyramidal symptoms are more likely to occur in some patients.

High dosage: The recommended starting dose for physically fit adults is 5 mg twice a day (or one 10 mg Spansule capsule a day); after a week this may be increased to 15 mg a day (which may be given as one 15 mg Spansule capsule). If necessary, further increases of 5 mg may be made at three-day intervals, but not more often. When satisfactory control has been achieved, dosage may be reduced gradually until an effective maintenance level has been established. Stelazine Span-

sule capsules are particularly useful for such maintenance therapy.

Intramuscular use: For a more rapid and intense effect or when oral administration presents difficulties, Stelazine may be given by deep intramuscular injection; the recommended dosage is 1–3 mg a day, given in divided doses. Higher dosages may sometimes be necessary up to a suggested maximum of 6 mg a day. Oral therapy should be substituted as soon as possible.

Children: Low dosage: For children aged 3–5 years, up to 1 mg a day as the syrup, given in divided doses. For children aged 6–12 years, the dosage may be increased to a maximum of 4 mg a day.

High dosage: For children aged under 12 years, the initial oral dosage should not exceed 5 mg a day, given in divided doses. Any subsequent increase should be made with caution, at intervals of not less than three days, and taking into account age, body weight and severity of symptoms.

Intramuscular use: There has been little experience in the use of intramuscular Stelazine in children. If required, a starting dose of 1 mg per 20 kg (44 lb) body weight a day, given in divided doses, is suggested.

Use of liquid presentations: Dilute Stelazine concentrate before use; one volume of the concentrate diluted preferably with Syrup BP or else purified water to produce 10 volumes gives a concentration of 5 mg trifluoperazine in each 5 ml dose. Both syrup and concentrate may be administered with a drink of water, milk, orange, tomato or other fruit juices, syrups or in carbonated beverages, or semi-solid foods such as soup, puddings or ice-cream.

Contra-indications, warnings, etc

Contra-indications: Do not use Stelazine in comatose patients, or in those with existing blood dyscrasias or known liver damage.

Cautions: Care should be exercised when treating elderly patients or those with cardiovascular disease, because of the occasional mild hypotensive effect of the drug; and when treating patients with angina pectoris, as Stelazine may increase activity.

Nausea and vomiting as a sign of organic disease may be masked by the anti-emetic action of Stelazine.

Metrizamide should be avoided in patients on phenothiazines since they may lower the seizure threshold.

Patients who drive or operate machinery should be warned of the possibility of drowsiness.

Use in pregnancy and lactation: Stelazine has been available since 1958, and there is no experimental or clinical evidence (including follow-up surveys in over 800 women who had taken low-dosage Stelazine during pregnancy) to suggest any associated hazard to the foetus. Nevertheless, drug treatment should be avoided in pregnancy unless essential, especially during the first trimester. Trifluoperazine passes into the milk of lactating dogs.

Adverse reactions: Lassitude, drowsiness, dizziness, transient restlessness, insomnia, dry mouth, blurred vision, muscular weakness, anorexia, mild hypotension and skin reactions may occasionally occur. Lactation and amenorrhoea are rare, tend to be dose-dependent, and may be related to increased secretion of prolactin.

Extrapyramidal symptoms are rare at daily dosages of 6 mg or less; they are considerably more common at higher dosage levels. These symptoms include parkinsonism; akathisia, with motor restlessness and difficulty

sitting still; and acute dystonia or dyskinesia, which may present with torticollis, facial grimacing, trismus, tongue protrusion and abnormal eye movements including oculogyric crises. Such reactions may often be controlled by reducing the dosage or by stopping medication. In more severe dystonic reactions, an anticholinergic antiparkinsonism drug should be given.

Tardive dyskinesia of the facial muscles, sometimes with involuntary movements of the extremities, has occurred in some patients on long-term high dosage and, more rarely, low-dosage phenothiazine therapy, including Stelazine. Symptoms may appear for the first time either during or after a course of treatment; they may become worse when treatment is stopped. The symptoms may persist for many months or even years, and while they gradually disappear in some patients, they appear to be permanent in others. Patients have most commonly been elderly, with organic brain damage. Particular caution should be observed in treating such patients. Gradual reduction of dosage to reveal persisting dyskinesia has been suggested, so that treatment may be topped if necessary. Anticholinergic antiparkinsonism agents have proved of little value in this syndrome.

Mild cholestatic jaundice, and blood dyscrasias such as agranulocytosis, pancytopenia, leucopenia and thrombocytopenia have been reported very rarely.

Very rare cases of skin pigmentation and lenticular opacities have been reported with Stelazine.

Overdosage: Signs and symptoms will be predominantly extrapyramidal; hypotension may occur. Absorption of trifluoperazine from the Spansule capsule is likely to be prolonged, and this should be borne in mind. Treatment consists of gastric lavage together with supportive and symptomatic measures. Do not induce vomiting. Extrapyramidal symptoms may be treated with an anticholinergic antiparkinsonism drug. Treat hypotension with fluid replacement; if severe or persistent, noradrenaline may be considered. Adrenaline is contra-indicated.

Pharmaceutical precautions Store tablets and spansule capsules in a cool, dry place, protect from light, and dispense in moisture-proof, light-resistant containers. Store Stelazine ampoules, syrup and concentrate in a cool place, and protect from light. When it is necessary to dilute the syrup, Syrup BP only should be used. The concentrate must be diluted before use, if possible with Syrup BP; this solution is stable for up to 2 weeks if kept in amber bottles in a cool place. Alternatively, dilute with water; this solution, however, is only stable for more than one week if a suitable preservative, such as 0.05% w/v sodium benzoate, is added. Diluents containing sodium salts of hydroxybenzoates should not be used as cloudiness may result.

Legal category POM.

Package quantities Tablets, 1 mg, in containers of 100 and 1,000. Tablets, 5 mg, in containers of 100, 500 and 5,000.

Spansule capsules, 2 mg, in containers of 30, 250 and 5,000. Spansule capsules, 10 mg and 15 mg, in containers of 100 and 5,000.

Syrup, in bottles containing 200 ml.

Concentrate, in bottles containing 100 ml and one litre.

Ampoules, each containing 1 ml, in boxes of 12.

TAGAMET* TABLETS

TAGAMET* SYRUP

TAGAMET* INJECTION

Presentation Pale green, circular, film-coated tablets, engraved TAGAMET on one side and SK&F 200 on reverse, containing 200 mg cimetidine.

Pale green, oblong, film-coated tablets, engraved TAGAMET on one side and SK&F 400 on reverse, containing 400 mg cimetidine.

A clear, orange-coloured, peach-flavoured syrup, each 5 ml dose containing 200 mg cimetidine.

Ampoules containing 200 mg cimetidine in 2 ml solution.

Uses Tagamet is a histamine H₂-receptor antagonist which inhibits both basal and stimulated gastric secretion of acid and reduces pepsin output.

Tagamet is indicated in the treatment of duodenal and benign gastric ulceration, recurrent and stomal ulceration, reflux oesophagitis and other conditions where reduction of gastric acid by Tagamet has been shown to be beneficial, i.e.: the prophylaxis of gastro-intestinal haemorrhage from stress ulceration in seriously ill patients; before general anaesthesia in patients thought to be at risk of acid aspiration (Mendelson's) syndrome, particularly obstetric patients during labour; and to reduce malabsorption and fluid loss in the short bowel syndrome. Tagamet is also recommended in the management of the Zollinger-Ellison syndrome.

Dosage and administration *Adults: Oral:* The usual dosage is 200 mg three times a day with meals and 400 mg at bedtime (1.0 g/day). In duodenal ulcer, 400 mg b.d., with breakfast and at bedtime, has also been shown to be effective.

If there is inadequate response, 400 mg four times a day (1.6 g/day) may be given, also with meals and at bedtime.

Treatment should be given initially for at least four weeks (six weeks in benign gastric ulcer) even if symptomatic relief has been achieved sooner.

Treatment may be continued for longer periods in those patients who may benefit from reduction of gastric secretion and the dosage may be reduced in those who have responded to treatment, for example to 400 mg at bedtime or 400 mg in the morning and at bedtime.

In patients with duodenal ulcer disease who have responded to the initial course, relapse may be prevented by continued treatment with 400 mg at bedtime or 400 mg in the morning and at bedtime for at least six months.

In reflux oesophagitis, 400 mg four times a day with meals and at bedtime for four to eight weeks is recommended.

In patients with very high gastric acid secretion (e.g. Zollinger-Ellison syndrome) it may be necessary to increase the dose to 400 mg four times a day, or in occasional cases to 2 g/day.

Antacids can be made available to all patients until symptoms disappear.

In the prophylaxis of haemorrhage from stress ulceration in seriously ill patients up to 2 g per day can be given in divided doses to maintain intragastric pH above 4.

In patients thought to be at risk of acid aspiration syndrome an oral dose of 400 mg can be given 90–120 minutes before induction of general anaesthesia. Up to this dose may be repeated (parenterally if appropriate) as required if operation is prolonged. Tagamet syrup should not be used. In obstetric patients during labour, an initial oral dose of 400 mg at the start of labour followed by 200 mg every two hours to a maximum of 1.6 g has been used. The usual precautions to avoid acid aspiration should be taken.

In the short bowel syndrome, e.g. following substantial resection for Crohn's disease, 1 g a day in divided doses, as above, can be used.

Parenteral: Tagamet may be given intramuscularly or intravenously.

The dose by intramuscular injection is normally 200 mg which may be repeated at four- to six-hourly intervals.

The dose by direct intravenous injection is normally 200 mg which should be given **slowly**, and may be repeated four- to six-hourly. If there is cardiovascular impairment, or if a larger dose is needed, the dose should be diluted and given over at least 10 minutes. In such cases infusion is preferable.

The dose by intermittent intravenous infusion is 100 mg/hour for two hours, repeated at four- to six-hourly intervals. The maximum infusion rate should not usually exceed 150 mg/hour (or 2 mg/kg body weight/hour). By continuous intravenous infusion an average rate of up to 75 mg/hour during 24 hours should suffice.

The total daily dose by any route should not normally exceed 2 g.

N.B. Dosage should be reduced in patients with impaired renal function (see *Cautions*).

Children: Experience with Tagamet in children is limited and it has not been evaluated in clinical studies (see **Further information**).

Contra-indications, warnings, etc No known contra-indications.

Cautions: Dosage should be reduced in patients with impaired renal function according to creatinine clearance. The following dosages are suggested: creatinine clearance of 0 to 15 ml per minute, 200 mg twice a day; 15 to 30 ml per minute, 200 mg three times a day; 30 to 50 ml per minute, 200 mg four times a day; over 50 ml per minute, normal dosage. Cimetidine is removed by haemodialysis.

Tagamet can prolong the elimination of drugs metabolised by oxidation in the liver. Pharmacological interactions with a number of drugs, e.g. diazepam, propranolol, have been demonstrated. Only those with oral anticoagulants and phenytoin appear, to date, to be of clinical significance. Close monitoring of patients on Tagamet receiving oral anticoagulants or phenytoin is recommended and a reduction in the dosage of these drugs may be necessary.

Clinical trials of over two year's continuous treatment and more than five years' widespread use have not revealed unexpected adverse reactions related to long-term therapy. The safety of prolonged use is not, however, established and care should be taken to observe periodically patients given prolonged treatment.

Before Tagamet treatment is commenced in gastric ulcer, malignancy should be excluded as treatment may alleviate symptoms and delay diagnosis.

In patients on drug treatment or with illnesses that could cause falls in blood cell count, the possibility that H_2 -receptor antagonism could potentiate this effect should be borne in mind.

Use in pregnancy and lactation: Although tests in animals have not revealed any hazards from the administration of Tagamet during pregnancy or lactation, both these and studies in women have shown that it does cross the placental barrier and is excreted in milk. As with most drugs, the use of Tagamet should be avoided during pregnancy and lactation unless essential.

Adverse reactions: Diarrhoea, dizziness or rash, usually mild and transient, and tiredness have been reported. Mild gynaecomastia appears to be a rare response. Biochemical or biopsy evidence of reversible liver damage has been reported occasionally. Reversible confusional states have also occurred, usually in elderly or already very ill patients (e.g. those with renal failure). Interstitial nephritis or acute pancreatitis, reversed or withdrawal of Tagamet, has been encountered very rarely. Isolated increases in plasma creatinine have been of no clinical significance.

Overdosage: Acute overdosage of up to 20 grams has been reported several times with no significant ill effects. Induction of vomiting and/or gastric lavage may be employed together with symptomatic and supportive therapy.

Pharmaceutical precautions Store syrup and ampoules in a cool place, and protect from light.

Legal category POM.

Package quantities Tablets, 200 mg, in containers of 500 and 5,000. Tablets, 400 mg, in calendar packs of 56 and in containers of 2,500. Syrup in bottles containing 200 ml. Ampoules in boxes of 10.

Further information Tagamet has been shown to be compatible with electrolyte and dextrose solutions commonly used for intravenous infusion.

Tagamet has not been evaluated in clinical trials in children. However, where inhibition of gastric acid secretion was considered essential, Tagamet in doses of 20 to 40 mg/kg/day was administered in divided doses by mouth or intravenously.

VERTIGON* SPANSULE* CAPSULES

Presentation Clear, colourless capsules, opaque purple-capped and filled with a mixture of yellow-green and white pellets, in two strengths. Each Spansule sustained-release capsule, size No. 4, contains 10 mg, and each capsule, size No. 3, 15 mg prochlorperazine present as the maleate. Two-thirds of the dose is specially formulated for sustained release over a period of six to eight hours.

Uses Vertigon is a potent phenothiazine tranquilliser, anti-emetic, and vestibular sedative.

Vertigon Spansule capsules are indicated in the symptomatic treatment of vertigo due to Menière's

sease, labyrinthitis or other causes; nausea and vomiting associated with vertigo or other causes; and minor mental and emotional disturbances.

Dosage and administration *Adults and children aged 12 years and over:* Usually one 15 mg Vertigon spansule capsule once or twice a day. In less severe cases one 10 mg capsule once or twice a day may be adequate. When satisfactory control has been achieved, daily maintenance dosage of one 10 mg or 15 mg spansule may be given.

Contra-indications, warnings, etc

Contra-indications: Vertigon is contra-indicated in patients with existing blood dyscrasias or known liver damage.

Warnings: Caution should be exercised when treating elderly patients or those with cardiovascular disease because of the possibility of hypotension.

Nausea and vomiting as a sign of organic disease may be masked by the anti-emetic action of Vertigon.

Patients who drive or operate machinery should be warned of the possibility of drowsiness.

Use in pregnancy: Prochlorperazine has been available for many years, and there is no experimental or clinical evidence to suggest any associated hazard to the foetus. Nevertheless, drugs should be avoided in pregnancy unless essential, especially during the first trimester.

Adverse reactions: Drowsiness, dizziness, skin reactions, dry mouth and, rarely, hypotension may occur; effects such as amenorrhoea are extremely unusual at this dosage level.

Extrapyramidal reactions are very unlikely at the recommended dosage, but at the higher dosage levels used in psychiatry they are considerably more common. Prolonged, such dosage with phenothiazines may be

associated with skin pigmentation, and lenticular opacities. Tardive dyskinesia has occurred in some patients on long-term high-dosage and, more rarely, low-dosage phenothiazine therapy; this may be long-lasting or irreversible.

Rare cases of toxic hepatitis of a cholestatic type, and leucopenia and agranulocytosis have been reported with prochlorperazine.

Overdosage: Signs and symptoms will be predominantly extrapyramidal; hypotension may occur. Absorption of prochlorperazine from the sustained-release Spansule capsule is likely to be prolonged, and this should be borne in mind. Treatment consists of gastric lavage together with appropriate supportive and symptomatic measures. Do not induce vomiting. Extrapyramidal symptoms may be treated with an anticholinergic antiparkinsonism drug. Treat hypotension with fluid replacement; if severe or persistent, noradrenaline may be considered. Adrenaline is contra-indicated.

Pharmaceutical precautions Store in a cool, dry place, protect from light, and dispense in moisture-proof, light-resistant containers.

Legal category POM.

Package quantities Both strengths in containers of 100 Spansule capsules.

ADCORTYL* CREAM, OINTMENT, SPRAY AND ADCORTYL* IN ORABASE*

Presentation *Cream:* White cream containing triamcinolone acetonide 0.1% in an aqueous vanishing cream base.

Ointment: White, nearly translucent, containing triamcinolone acetonide 0.1% in Plastibase.*

Spray: Colourless, clear liquid containing triamcinolone acetonide 3.3 mg in 50 g vehicle.

Adcortyl in Orabase: White to light tan crystalline paste containing triamcinolone acetonide 0.1% in Orabase (gelatin, pectin and sodium carboxymethylcellulose in Plastibase*).

Uses *Actions:* Triamcinolone acetonide is a potent fluorinated corticosteroid with rapid anti-inflammatory, antipruritic and anti-allergic actions.

Indications: Adcortyl Cream, Ointment and Spray are recommended in steroid-responsive conditions which may include: atopic eczema, contact eczema, follicular eczema, infantile eczema, otitis externa, anogenital eczema (pruritus ani et vulvae), nummular eczema, seborrhoeic or flexural eczema, neurodermatitis, psoriasis, sunburn, insect bites.

Adcortyl in Orabase is indicated for aphthous ulcers, ulcerative stomatitis, denture stomatitis, desquamative gingivitis, erosive lichen planus and lesions of traumatic origin.

Dosage and administration *Adults and children:*

Cream: To be applied to moist weeping lesions two to four times daily.

Ointment: To be applied to dry scaly lesions two to four times daily.

Spray: To be applied two to four times daily. The canister should be shaken thoroughly and held 3 to 6 inches from the affected area.

Adcortyl in Orabase: To be applied to the lesion two to four times daily. Apply to the affected area; do not rub in.

Contra-indications, warnings, etc

Contra-indications: In tuberculous and most viral lesions of the skin, particularly herpes simplex, vaccinia, varicella. The products should not be used in fungal or bacterial skin infections without suitable concomitant anti-infective therapy.

Precautions: In infants, long-term continuous topical steroid therapy should be avoided. Adrenal suppression can occur, even without occlusion. Topical administration of corticosteroids to pregnant animals can cause abnormalities of foetal development. The relevance of this finding to humans has not been established. However, topical steroids should not be used extensively in pregnancy, i.e. in large amounts or for long periods.

Side-effects: Triamcinolone acetonide is well tolerated. Signs of systemic toxicity such as oedema and electrolyte

imbalance have not been observed even when high topical dosage has been used.

Pharmaceutical precautions *Storage:*

Cream: At room temperature; avoid freezing.

Ointment: At room temperature.

Spray: In a cool place; normal aerosol precautions should be observed.

Adcortyl in Orabase: At room temperature.

Dilution: *Cream:* Cetomacrogol Cream (formula B) BPC Aqueous Cream BP is also suitable if the chlorocresol content is increased to 0.2%. Diluted creams should be stored below 25°C and should be discarded two weeks after dilution.

Ointment: White soft paraffin.

Adcortyl in Orabase: Should not be diluted. The manufacturer's advice should be sought before dilution with any other preparation.

Legal category POM.

Package quantities

Cream: Tubes of 30 g.

Ointment: Tubes of 30 g.

Aerosol Spray: Cans of 50 g.

Adcortyl in Orabase: Tubes of 10 g.

**ADCORTYL*
INTRA-ARTICULAR/INTRADERMAL**

Presentation Sterile aqueous suspension containing triamcinolone acetonide 10 mg per ml.

Uses *Actions:* Triamcinolone acetonide is a synthetic glucocorticoid with marked anti-inflammatory and anti-allergic actions. Following local injection of Adcortyl relief of pain and swelling and greater freedom of movement are usually obtained within a few hours; such administration avoids the more severe systemic side-effects which may accompany parenteral or oral corticosteroid administration.

Indications: Intra-articular use: for alleviating the joint pain, swelling and stiffness associated with rheumatoid arthritis and osteoarthritis; also for acute and subacute bursitis, epicondylitis, tendinitis and acute, non-specific tenosynovitis.

Intradermal use: for localised hypertrophic inflammatory lesions which may include lichen simplex chronicus (neuro-dermatitis), psoriatic plaques, granuloma annulare, lichen planus, certain keloids and alopecia areata and alopecia totalis.

Dosage and administration Adcortyl injection is not for intra-venous use.

Adults: The dose of Adcortyl injection for intra-articular administration, and injection into tendon sheaths and bursae, is dependent on the size of the joint to be treated and on the severity of the condition. Doses of 2.5-5 mg (0.25-0.5 ml) for smaller joints and 5-15 mg (0.5-1.5 ml) for larger joints usually alleviate the symptoms. Intradermal dosage is usually 2-3 mg (0.2-0.3 ml), depending on the size of the lesion. No more than 5 mg (0.5 ml) should be injected at any one site. If several sites are injected the total dosage administered should not exceed 30 mg (3 ml). The injection may be repeated if necessary, at one or two week intervals.

B. Strict aseptic precautions should be observed.

Children: Adcortyl intra-articular/intradermal may be used in children in suitable adjusted dosages.

Contra-indications, warnings, etc

Contra-indications: In the presence of active infection or near joints or dermatological lesions to be treated. The preparation should not be used to alleviate joint pain arising from infectious states such as gonococcal or bacterial arthritis.

Precautions: Following intra-articular steroid therapy, patients should be specifically warned to avoid over use of joints in which symptomatic benefit has been obtained. Severe joint destruction with necrosis of bone may occur following repeated intra-articular injections are given over a long period of time. Care should be taken where injections are given into tendon sheaths to avoid injection into the tendon itself.

Due to the absence of a true tendon sheath, the chilles tendon should not be injected with depot corticosteroids.

In pregnant animals, systemic administration of corticosteroids can cause abnormalities of foetal development. The relevance to humans of this finding has not been established.

Side-effects: Reactions following intra-articular administration have been rare. In a few instances transient flushing and dizziness have occurred. Pain and other local symptoms may continue for a short time before effective relief is obtained, but an increase in joint discomfort has seldom occurred. Local atrophy sometimes occurs, but is temporary and disappears within a few weeks to months.

The possibility of the systemic effects which are associated with all steroid therapy should be considered.

Pharmaceutical precautions *Storage:* In an upright position at room temperature: avoid freezing.

Legal category POM.

Package quantities Multidose vials of 5 ml, 5 x 1 ml ampoules.

Further information Nil.

Product licence number 0034/5002.

ADCORTYL* TABLETS

Presentation White tablets containing 4 mg triamcinolone, scored one side and engraved Squibb and 512 in reverse.

Uses *Actions:* Triamcinolone is a potent corticosteroid with marked anti-inflammatory and anti-allergic actions.

Triamcinolone induces few of the gastro-intestinal disturbances of other glucocorticoids, causes little undesirable psychic stimulation, and does not normally give rise to sodium and water retention even with prolonged administration. Triamcinolone persists in the blood for a longer time than other related steroids.

Indications: Adcortyl tablets are indicated in steroid responsive conditions, and where anti-inflammatory and anti-allergic treatment is required.

Dosage and administration *Adult dosage:* The usual daily dose of Adcortyl tablets is 8-24 mg orally in divided doses. Once a satisfactory response is obtained, the dose is gradually reduced to 2-4 mg every two or three days until an optimum maintenance level is reached. In certain cases symptomatic relief may be maintained with the total dosage of the steroid given once daily or on alternate days. This regimen reduces the risk of adrenal suppression and has much to recommend it, where applicable. The dosages suggested here are merely intended as a guide to specific treatment and have been derived from clinical experience.

The table at the top of the next page gives detailed dosage recommendations.

Contra-indications, warnings, etc

Contra-indications: In latent or healed tuberculosis; in the presence of local or systemic viral infection; in acute psychoses and in patients with an active peptic ulcer; in acute glomerulonephritis and in active infections not controlled by antibiotics.

Corticosteroids are not indicated for patients with myasthenia gravis, diverticulitis, recent intestinal anastomoses, thrombophlebitis, psychotic tendencies, exanthematous disease, chronic nephritis, metastatic carcinoma, osteoporosis, and a history of peptic ulcer. In the presence of any of these conditions, the need for corticosteroid therapy must be carefully weighed against possible deleterious effects.

Precautions: The usual early unwanted corticosteroid effects, such as increase in weight, oedema and hypertension, generally do not occur with triamcinolone, but, as with other potent corticosteroids, clinical supervision is necessary.

During prolonged therapy a liberal protein intake is essential to counteract the tendency to gradual weight loss sometimes associated with negative nitrogen balance and wasting of skeletal muscle.

Corticosteroids are not recommended for pregnant patients, particularly in the first trimester, except when the disease for which they are indicated warrants their use. Hypo-adrenalism may occur in the newborn of mothers receiving corticosteroid therapy.

Diabetes may be aggravated, necessitating a higher insulin dosage. Latent diabetes mellitus may be precipitated.

Menstrual irregularities may occur, and this possibility should be mentioned to female patients.

Patients on long-term systemic therapy with triamcinolone may require supportive corticosteroid therapy in times of stress (such as trauma, surgery or severe illness) both during the treatment period and for a year afterwards.

Side-effects: Unwanted effects which may be associated with systemic corticosteroid therapy include: Cushingoid changes or other signs of fat deposition; weakness, bruising or purpura; striae; osteoporosis; spontaneous fractures; sweating or flushing of the face; thrombo-

<i>Condition</i>	<i>Initial daily dose</i>	<i>Maintenance daily dosage</i>
Rheumatoid arthritis	Adults [1] and children: 4-12 mg	Adults: lowest adequate dose Children: individualised
Rheumatic fever (acute)	In divided doses Adults: 16-20 mg Children: 8-10 mg	Adults and children: gradually reduce discontinue
Allergic disorders	Adults [2]: 8-16 mg Children: 4-8 mg	Adults: 4-16 mg Children: 2 mg or less
Bronchial asthma	Adults [2]: 8-16 mg Children: 8-12 mg	Adults: 2-8 mg Children: 1-4 mg
Dermatoses [3]	Adults [2]: 8-20 mg Children: 4-12 mg	Adults and children: 2 mg or less
Psoriasis [4] acute exacerbations	Adults: 4-32 mg (advocated for short-term control only)	Adults: 1-16 mg
Angioneurotic oedema	Adults: 8-16 mg	Adults gradually reduce
Nephrotic syndrome	Adults and children: 20-48 mg until diuresis (usually within 7- 10 days)	Adults and children: intermittent therapy 8-16 mg for three consecutive days per week
Pulmonary emphysema: pulmonary fibrosis [5]	Adults: 8-32 mg	Adults: 1-4 mg
Lymphomatous diseases; chronic leukaemia	Adults and children: 32-60 mg	Adults and children: 2-24 mg
Acute lymphatic leukaemia	Children: 1 mg/kg body weight	Same as initial dose
Systemic lupus erythematosus; other collagen diseases	Adults and children: 20-32 mg	Adults and children: 4-20 mg
Acute connective tissue diseases (acute bursitis, myositis, fibrositis, etc)	Adults [2]: 8-16 mg	Adults: 1-8 mg
Uveitis	Adults: 24-32 mg	Adults: gradually reduce
Sprue	Adults: 12-24 mg Children: 3 mg or more	Adults and children: gradually reduce
Urticaria	Adults [2] and children: 12-20 mg for five days	

Adcortyl tablets are suitable for administration to children; dosage should be adjusted according to total body area, body weight and severity of the condition.

1. A single daily dosage regimen may be tried. If response is unsatisfactory, daily dosage should be given in divided amounts.
2. Single daily doses have been effectively employed.
3. For some chronic dermatoses, an alternate-day dosage regimen, using doses equivalent to daily dosage, may be effective. Severe pemphigus requires high initial doses, even up to 100 mg daily in divided doses.
4. Potent systemic steroids are not recommended for mild, uncomplicated psoriasis. Psoriasis recurs when medication is discontinued and may be more severe due to a rebound phenomenon.
5. Appropriate antibiotic therapy must be given simultaneously.

embolism; necrotising angitis; acute pancreatitis; ulcerative oesophagitis; activation or aggravation of peptic ulcer or other gastro-intestinal upsets; oedema; hypertension; hirsutism; acneiform eruptions; vertigo; headache; or severe mental disturbances. Increased intracranial pressure, papilloedema and posterior subcapsular cataracts have also been associated with prolonged corticosteroid administration.

Where adverse reactions occur they are usually reversible following cessation of therapy.

Overdosage: Careful monitoring of serum electrolytes should be undertaken. Patients should be slowly weaned off the high dose by giving reducing quantities of Adcortyl tablets over a period of one to three weeks.

Pharmaceutical precautions *Storage:* At room temperature.

Legal category POM.

Package quantities Bottles of 100.

Further information Nil.

Product licence number 0034/5009

ADCORTYL[®] WITH GRANEODIN[®] CREAM, AND OINTMENT

Presentation *Cream:* White vanishing cream.

Ointment: Smooth, soft, translucent ointment.

Each gram of the cream and ointment contains:

Triamcinolone acetonide	0.1%
Neomycin (as sulphate)	0.25%
Gramicidin	0.025%

Uses *Actions:* Triamcinolone acetonide is a potent fluorinated corticosteroid with rapid anti-inflammatory antipruritic and anti-allergic actions.

The combined action of the antibiotics neomycin and gramicidin provides comprehensive antibacterial therapy against a wide range of Gram-positive and Gram

gative bacteria, including those micro-organisms responsible for most bacterial skin infections.

Indications: For the treatment of inflammatory dermatoses, which are complicated or threatened by secondary infection such as: atopic eczema, contact eczema, follicular eczema, infantile eczema, otitis externa, anogenital pruritus (pruritus ani et vulvae), psoriasis, nummular eczema, post-traumatic infective eczema, seborrheic or flexural eczema, neurodermatitis.

Dosage and administration *Adults and children:* Apply to the affected areas two to four times daily.

Intra-indications, warnings, etc

Intra-indications: In tuberculosis and most fungal and all lesions of the skin, particularly herpes simplex, eczema and varicella. Also in the treatment of deep-seated bacterial infections.

Precautions: The use of occlusive dressings should be avoided because of the increased risk of sensitivity reactions. In infants, long-term continuous topical steroid therapy should be avoided. Adrenal suppression can occur, even without occlusion. Topical administration of corticosteroids to pregnant animals can cause abnormalities of foetal development. The relevance of this finding to humans has not been established. However, topical steroids should not be used extensively in pregnancy, i.e. in large amounts or for long periods.

Side-effects: Sensitivity reactions to neomycin may occur especially with prolonged use. Gramicidin sensitivity has occasionally been reported.

Pharmaceutical precautions *Storage: Cream:* At room temperature; avoid freezing.

Ointment: At room temperature.

Contraindication: Not recommended, as this would reduce the concentration of the antibiotics to below therapeutic levels.

Legal category POM.

Packaging quantities *Cream/Ointment:* 15 g tubes

Capoten with Graneodin Cream	0034/5015
Capoten with Graneodin Ointment	0034/5017

APOTEN* TABLETS ▼

Presentation *Capoten tablets 25 mg:* Slightly mottled, white, square biconvex tablets each containing captopril 25 mg. Engraved with 'Squibb' and '452' on one side and with quadrisection bars (for identification only) on the other.

Capoten tablets 50 mg: Slightly mottled, white, oval, convex tablets each containing captopril 50 mg. Engraved with 'Squibb' and '482' on one side with a section bar on the other.

Capoten tablets 100 mg: Slightly mottled, white, oval, convex tablets each containing captopril 100 mg. Engraved with 'Squibb' and '485' on one side with a section bar on the other.

Uses **Actions:** Captopril 1-[(2S)-3-mercapto-2-ethyl-propionyl]-L-proline is a highly specific competitive inhibitor of angiotensin I-converting enzyme, the enzyme responsible for the conversion of angiotensinogen to angiotensin II.

Its mechanism of action in hypertension has not yet been fully elucidated; however, it appears to lower blood pressure primarily through suppression of the renin-angiotensin-aldosterone system.

Until further experience has been obtained in the treatment of acute hypertensive crises, the use of Capoten should be avoided in these patients.

It has also been shown to be of benefit in the management of severe, treatment-refractory congestive heart failure.

Indications: *Hypertension:* The treatment of severe hypertension where standard therapy has failed.

Congestive heart failure: Captopril is indicated for the treatment of severe, treatment-refractory congestive heart failure. The drug should be used together with diuretics and digitalis, but only after these agents have failed to produce a satisfactory response.

Dosage and administration *Recommended dose and dosage schedule:* Capoten (captopril) should be taken one hour before meals.

Adults: Hypertension: The usual dose of Capoten is 25-50 mg t.i.d.

The initial daily dose of Capoten is 25 mg t.i.d. which should be increased to 50 mg t.i.d. if a satisfactory reduction of blood pressure has not been achieved in two weeks. If a patient is not receiving a diuretic and a satisfactory response has not been achieved after a further two weeks a modest dose of a thiazide diuretic (hydrochlorothiazide) or in patients with impaired renal function a loop diuretic (frusemide) should be added. The diuretic should be increased at one to two week intervals until a satisfactory response is obtained or its maximal antihypertensive dose is reached.

Should Capoten 50 mg t.i.d. together with the diuretic fail to give a satisfactory reduction in blood pressure, then Capoten should be increased to 100 mg t.i.d., and then, if necessary, 150 mg t.i.d. A maximum daily dose of 450 mg Capoten should not be exceeded.

For patients with accelerated or malignant hypertension who are unresponsive to conventional therapy, it may be necessary to increase the daily dose of Capoten (captopril) every 24 hours, until a satisfactory blood pressure response is obtained or the maximum dose of Capoten is reached.

When Capoten (captopril) is used alone, concomitant sodium restriction may be advantageous. Capoten may be used in conjunction with other antihypertensive agents, particularly thiazide diuretics and beta-blockers.

For some patients on multiple antihypertensive agents, there may be clinical reasons for which it would be impractical to discontinue all antihypertensive therapy prior to starting Capoten. Recognising that Capoten would usually be used in combination with a thiazide diuretic, the patient may have Capoten 25 mg t.i.d. initiated under close medical supervision while continuing diuretic therapy. Other currently administered antihypertensive agents should be discontinued according to the instructions of the manufacturer.

Heart failure: Capoten therapy must be started under close medical supervision. The usual starting dose is 25 mg t.i.d. A starting dose of 6.25 or 12.5 mg t.i.d. may minimise a transient hypotensive effect. After a dose of 50 mg t.i.d. is reached, further increases in dosage should be delayed where possible, for at least two weeks to determine if a satisfactory response occurs.

Capoten should be used in conjunction with a diuretic and where appropriate digitalis. A maximum daily dose of 450 mg should not be exceeded.

Patients with renal impairment: An average of about 75% of a given daily dose of captopril is usually excreted in the urine; captopril retention occurs in the presence of impaired renal function. After the desired therapeutic effect has been achieved, the total daily dose should be reduced or the dose intervals increased. The following maximum daily doses are suggested as a guide to minimise drug accumulation.

<i>Creatinine Clearance (ml/min/1.73m²)</i>	<i>Maximum Total Daily Dose (mg)</i>
> 80	450
80-41	300
40-21	150
20-11	75
< 10	37.5

When concomitant diuretic therapy is required, a loop diuretic (e.g. frusemide) is preferable to a thiazide diuretic.

Children: Safety and effectiveness in children have not been established. Capoten (captopril) should be used only if the potential benefit justifies the risk.

Starting dose should be 0.3 mg per Kg bodyweight up to a maximum of 6 mg per Kg bodyweight divided into three doses per day.

Contra-indications, warnings, etc

Contra-indications: A history of previous hypersensitivity to captopril.

Warnings: NEUTROPENIA/AGRANULOCYTOSIS and PROTEINURIA have been reported in patients receiving captopril.

Neutropenia/Agranulocytosis: Although neutropenia has occurred in patients receiving Capoten, it usually was found in those with impaired renal function, connective tissue disease, while under treatment with immuno-suppressant drugs, or combinations of these. Systemic lupus erythematosus (SLE) and other autoimmune/collagen disorders were present in one-third of these patients and almost all had renal impairment. In patients with normal renal function neutropenia rarely occurred. In patients with impaired renal function the incidence of neutropenia was approximately 1.1% and the daily dose of Capoten in these patients was relatively high. The median time of onset of neutropenia was approximately seven weeks after starting Capoten therapy (range 2½ to 13 weeks). The neutropenia sometimes was associated with significant alterations in red blood cell or platelet counts. Serious infections resulting from the neutropenia occurred only in patients with impaired renal function.

Bone marrow examinations of patients with neutropenia consistently showed myeloid hypoplasia, frequently accompanied by erythroid hypoplasia and decreased numbers of megakaryocytes.

Capoten should be used with caution in patients with impaired renal function or with connective tissue disease, particularly SLE, and in patients concurrently receiving drugs known to affect the white cells or immune response. White blood cell and differential counts should be performed on these patients before starting treatment and every two weeks during the first three months of therapy and periodically thereafter.

All patients treated with Capoten should be told to report any signs of infection (e.g. sore throat, fever). A complete white blood count should be done immediately when such a report is made and if this occurs during the

first three months of therapy, Capoten should be withdrawn until the results of the blood count are known.

Upon any sign of neutropenia (a neutrophil count 1,000/mm³) the physician should withdraw Capoten and other drugs, and follow the patient's course. Capoten is responsible for the neutropenia, the white count generally returns to normal within several weeks after discontinuing the drug.

Proteinuria: Proteinuria of greater than 1 g per day was seen in 1.2% of patients receiving captopril, and two-thirds of affected patients had evidence of prior renal disease. Nephrotic syndrome occurred in about one-quarter of these cases. Membranous glomerulopathy was found in some patients who had renal biopsy. It is not known whether this might have pre-existed and it is recognised that membranous glomerulopathy can occur in patients with hypertension. In most cases proteinuria occurred by the eighth month of therapy and subsided or cleared within six months whether or not captopril was continued, while some patients had persistent proteinuria. Parameters of renal function, such as BUN and creatinine, were seldom altered in the patients who developed proteinuria.

It is recommended that patients have urinary protein estimations (dip stick) prior to treatment, subsequent at monthly intervals during the first eight months, and periodically thereafter. For patients who develop persistent or increasing significant proteinuria, a 24-hour quantitative determination should be obtained, and this exceeds 1 g/day, the benefits and risks of continuing Capoten should be evaluated.

Hypotension: Although most patients tolerate Capoten well, those already on diuretic therapy may occasionally experience dizziness or lightheadedness, usually mild and indicative of hypotension, that may occur within one hour of the first dose. In most instances, symptoms are relieved simply by instructing the patient to lie down.

In patients who are receiving aggressive diuretic therapy, particularly those with either severe and renal dependent hypertension (e.g. renovascular hypertension) or severe congestive heart failure, exaggerated hypotensive responses have occurred, again usually within one hour of the initial dose of captopril. In these patients, by discontinuing diuretic therapy or significantly reducing the diuretic dose for four to seven days prior to initiating captopril the possibility of this occurrence is lessened. By commencing captopril therapy with small doses (6.25 or 12.5 mg) the duration of any hypotensive effect is reduced.

The exaggerated hypotensive response can be anticipated by medical supervision during the first hour after initial dosing; and if appropriate it can be reversed by intravenous infusion of normal saline.

The occurrence of first dose hypotension does not preclude subsequent dose titration with captopril.

Patients treated for severe congestive heart failure should be warned to increase their physical activity slowly.

Serum potassium: Since Capoten decreases aldosterone production, elevation of serum potassium may occur especially in patients with renal failure. Potassium sparing diuretics or potassium supplements, if needed, should be used with caution, since they may lead to a significant increase in serum potassium.

Changes in renal function: Some patients with renal disease, particularly those with renal artery stenosis, have developed increased concentrations of blood urea

CORGARD* TABLETS ▼

Presentation Mottled white, round, biconvex tablets. The 80 mg nadolol tablet is scored on one side and engraved Squibb with 241 while the 40 mg nadolol tablet is unscored with Squibb and 207 engraved on one side.

Uses *Actions:* Nadolol is a beta-adrenergic receptor blocking agent with a prolonged activity, permitting once-daily dosage in both angina and hypertension.

Nadolol is not metabolised. It has no membrane stabilising or intrinsic sympathomimetic activity, and its only effect on the autonomic nervous system is one of beta-adrenergic blockade.

Receptor blockade by nadolol results in protection from excessive or inappropriate sympathetic activity. Nadolol reduces the number and severity of attacks of angina pectoris by blocking response to catecholamine stimulation and thus lowers the oxygen requirement of the heart at any given level of effort.

Nadolol reduces both supine and erect blood pressure. The mechanisms by which beta-blockade lowers blood pressure have not been fully elucidated. Like other beta-blockers, nadolol exerts an antiarrhythmic action.

Indications: Corgard is indicated in the management of:

Angina pectoris: For the long-term management of patients with angina pectoris by continuous medication.

Hypertension: for the long-term management of essential hypertension, either alone or in combination with other antihypertensive agents.

Dosage and administration In both angina pectoris and hypertension the dosage should be titrated gradually with at least a week between increments to assess response. In elderly patients, particularly those with angina pectoris, a low initial dose should be used so that sensitivity to side-effects may be assessed; individuals show considerable variation in their response to beta-adrenergic blockade.

Angina pectoris: Initially 40 mg once daily. This may be increased at weekly intervals until an adequate response is obtained or excessive bradycardia occurs. Most patients respond to 160 mg or less daily. The value and safety of daily doses exceeding 240 mg have not been established.

If nadolol is to be discontinued, reduce dosage over a period of at least two weeks (*see Warnings*).

Hypertension: Initially 80 mg once daily. This may be increased by a weekly increment of 80 mg or less until an optimum response is obtained. Most patients respond to 240 mg or less, daily, but doses up to 640 mg have been required for a few patients. In some patients it is

necessary to administer a diuretic, peripheral vasodilator and/or other antihypertensive agents in conjunction with nadolol in order to achieve satisfactory response.

Treatment of hypertension associated with phaeochromocytoma may require the addition of an alpha-blocking agent.

Nadolol may be given in a once daily dosage without regard to meals.

The dosage interval should be increased when creatinine clearance is below 50 ml/min/1.73m².

Contra-indications, warnings, etc

Contra-indications: Like other drugs in this class, nadolol is contra-indicated in bronchial asthma; sinus bradycardia and 2nd and 3rd degree heart block; cardiogenic shock; right ventricular failure secondary to pulmonary hypertension; congestive heart failure.

Warnings: Exacerbation of angina and myocardial infarction have occurred after abrupt discontinuation of therapy with beta-adrenergic blocking agents in patients with angina pectoris or other evidence of coronary artery insufficiency. When discontinuing long-term treatment with nadolol, the dosage should be reduced gradually over a period of at least two weeks and the patient carefully monitored.

Beta-adrenergic blockade carries the potential hazard of precipitating cardiac failure. Should this occur and it is not controlled by digitalisation, nadolol should be withdrawn, consideration being given to the foregoing warning.

Beta-blockade impairs the ability of the heart to respond to stress. It has been the usual practice to recommend withdrawal of beta-blockers several days prior to surgery (except for phaeochromocytoma). However, this may render the patient's blood pressure unstable and difficult to control during anaesthesia and the anaesthetist may wish to advise on discontinuation of therapy. In the event of emergency surgery, the effects of nadolol may be reversed by isoprenaline or noradrenaline. However, such patients may be subject to protracted severe hypotension. General anaesthetics which can cause myocardial depression, such as cyclopropane, trichloroethylene, chloroform and ether, should be avoided if nadolol is continued during surgery.

Nadolol should be administered with caution to patients with chronic obstructive airways disease.

Care should be exercised in the administration of nadolol to diabetic patients since early signs of acute hypoglycaemia may be masked. It may also be necessary to adjust the dosage of hypoglycaemic drugs.

There have been reports of skin rashes and/or dry eyes associated with the use of beta-adrenergic blocking drugs. The reported incidence is small and in most cases the symptoms have cleared when the treatment was withdrawn. Discontinuance of the drug should be considered if any such reaction is not otherwise explicable. Cessation of therapy with a beta-adrenergic blocker should be gradual.

The safety of nadolol in pregnancy has not yet been established. Nadolol is excreted in human milk, therefore nursing mothers should only receive nadolol if deemed essential.

Precautions: Close observation of patients receiving catecholamine depleting drugs, such as reserpine, in combination with nadolol is advised, since an excessive reduction in sympathetic drive to the heart might occur.

Occasionally, beta-blockade with drugs such as nadolol may produce hypotension and/or marked brady-

cardia, resulting in vertigo, syncope or orthostatic hypotension.

As with any new drugs given for long period laboratory examinations should be carried out intervals.

Care should be taken in administering nadolol during and within two weeks of administration of adrenergic augmenting psychotropic drugs such as monoamine oxidase inhibitors.

Nadolol should be used with caution in patients with impaired renal or hepatic function.

Administration in renal failure: In patients with decreased renal function, dosage adjustment is necessary. The recommended dosage intervals are:

Creatinine Clearance (ml/min/1.73 m ²)	Dosage Interval (Hours)
< 10	40-60
10-30	24-48
31-50	24-36
> 50	24

Side-effects: Most patients tolerate nadolol well. Side effects resemble those reported with other beta-blocking drugs and rarely require withdrawal of treatment. Those reported infrequently include gastro-intestinal effects: bradycardia, fatigue, light-headedness, cold extremities, insomnia, paraesthesia and dryness of the mouth. Cardiac insufficiency, hypotension and AV block have occurred on rare occasions.

Overdosage or exaggerated response: Excessive bradycardia should be treated initially with atropine. If there is no response, isoprenaline may be administered with caution.

Cardiac failure should be managed by digitalisation and diuretics. Glucagon has also been reported to be useful.

Hypotension may be managed with vasopressors such as adrenaline.

Bronchospasm may be counteracted by isoprenaline and aminophylline.

Pharmaceutical precautions Store at room temperature, protected from excessive heat and moisture in tightly closed container.

Legal category POM.

Package quantities Bottles of 100 tablets.

Further information Nadolol has been reported to increase renal blood flow, especially through the cortical nephrons.

Nadolol has negligible lipid solubility.

CORGARETIC* TABLETS ▼

Presentation White, blue-speckled, round, biconvex tablets, in two strengths.

Corgaretic 40: nadolol 40 mg with bendrofluazide 5 n is engraved 'Squibb' and '283' on one side with a bisect bar on the other.

Corgaretic 80: nadolol 80 mg with bendrofluazide 5 n is engraved 'Squibb' and '284' on one side with a bisect bar on the other.

es Actions: Nadolol is a beta-adrenergic receptor blocking agent with a prolonged activity, permitting once-daily dosage.

Nadolol is not metabolised. It has no membrane blocking or intrinsic sympathomimetic activity, and its effect on the autonomic nervous system is one of alpha-adrenergic blockade.

Receptor blockade by nadolol results in protection from excessive or inappropriate sympathetic activity.

Nadolol reduces both supine and erect blood pressure. The mechanisms by which beta-blockade lowers blood pressure have not been fully elucidated.

Bendroflumazide is a thiazide diuretic which interferes with renal tubular electrolyte reabsorption, thereby increasing sodium and water excretion.

ications: For the treatment of hypertension. The combination of a diuretic and a beta-blocker may be of particular value in patients whose blood pressure has not been adequately controlled with either component given alone.

Usage and administration *Dose of Corgaretic:* One to two tablets once daily to a maximum of 160 mg nadolol and 10 mg bendroflumazide. For doses of nadolol in excess of 160 mg, the combination product may not be appropriate because an excessive dose of the thiazide component may be administered.

The dosage should be titrated gradually with at least one week between increments to assess response.

Bendroflumazide is usually given at a dose of 5 to 10 mg per day. The initial dose of nadolol is 40 to 80 mg daily; this may be increased by weekly increments of 40 to 80 mg until an optimum response is obtained.

Treatment of hypertension associated with pheochromocytoma may require the addition of an alpha-blocking agent.

Nadolol may be given in a once-daily dosage without regard to meals.

The dosage interval should be increased when creatinine clearance is below 50 ml/min/1.73 m²:

<i>Creatinine Clearance (ml/min/1.73 m²)</i>	<i>Dosage Interval (Hours)</i>
> 50	24
31-50	24-36
10-30	24-48
< 10	40-60

Contra-indications, warnings, etc *Corgaretic is*

contra-indicated: In bronchial asthma, sinus bradycardia, 2nd or 3rd degree heart block, cardiogenic shock, left ventricular failure secondary to pulmonary hypertension, congestive heart failure, anuria, past sensitivity to thiazide diuretics.

warnings: Abrupt withdrawal of beta-blockers from patients with ischaemic heart disease can exacerbate angina and myocardial infarctions. When discontinuing therapy, the dosage should be reduced gradually over at least two weeks and the patient carefully monitored.

Cardiac failure: Beta-blockers carry the risk of potentiating cardiac failure. Should this occur and is not controlled by digitalisation, nadolol should be withdrawn slowly (see above warning).

Anaesthesia: Beta-blockade impairs the ability of the heart to respond to stress. It has been the usual practice to recommend withdrawal of beta-blockers several days or to surgery (except for pheochromocytoma). However, this may render the patient's blood pressure stable and difficult to control during anaesthesia and

the anaesthetist may wish to advise on discontinuation of therapy. In the event of emergency surgery, the effects of nadolol may be reversed by isoprenaline or noradrenaline. However, such patients may be subject to protracted severe hypotension. General anaesthetics which can cause myocardial depression, such as cyclopropane, trichloroethylene, chloroform and ether, should be avoided if nadolol is continued during surgery.

Thiazides may decrease the arterial responsiveness to noradrenaline. In emergency surgery, pre-anaesthetic and anaesthetic agents should be administered in reduced dosage.

Chronic obstructive airways disease: Nadolol should be administered with caution.

Diabetes and hypoglycaemia: Diabetic patients should be monitored closely as nadolol may mask the early signs of acute hypoglycaemia, and thiazide diuretics can lower insulin tolerance. Therefore, dosages of hypoglycaemic drugs or insulin doses may need adjustment.

Skin rashes and dry eyes: There have been reports of skin rashes and/or dry eyes associated with the use of beta-adrenergic blocking drugs. The reported incidence is small and in most cases the symptoms have cleared when the treatment was withdrawn. Discontinuation of the drug should be considered if any such reaction is not otherwise explicable. Cessation of therapy with a beta-adrenergic blocker should be gradual.

Use in pregnancy: Both nadolol and bendroflumazide cross the placental barrier and are excreted in breast milk. Therefore, as safety in pregnancy or lactation has not been established, and animal studies have shown some foetotoxicity, Corgaretic is not considered suitable for pregnant patients or nursing mothers.

Precautions: Close observation of patients receiving catecholamine-depleting drugs, such as reserpine, in combination with nadolol is advised, since an excessive reduction in sympathetic drive to the heart might occur.

Occasionally, beta-blockade with drugs such as nadolol may produce hypotension and/or marked bradycardia, resulting in vertigo, syncope or orthostatic hypotension.

As with any new drugs given for long periods, laboratory examinations should be carried out at intervals.

Nadolol and bendroflumazide should be used with caution in patients with impaired renal or hepatic function.

Care should be taken in administering nadolol during and within two weeks of administration of adrenergic augmenting psychotropic drugs such as monoamine oxidase inhibitors.

Periodic determination of serum electrolytes to detect possible imbalance, e.g. hyponatraemia, hypochloric alkalosis and hypokalaemia, should be performed at regular intervals.

The possibility that thiazides may exacerbate or activate systemic lupus erythematosus has been reported.

Potassium depletion is a danger to digitalised patients or those with hepatic cirrhosis with ascites.

Thiazide diuretics may raise serum uric acid levels, thus exacerbating gout in susceptible patients.

Side-effects: Most patients tolerate nadolol well. Side-effects resemble those reported with other beta-blocking drugs and rarely require withdrawal of treatment. Those reported infrequently include gastro-intestinal effects,

bradycardia, fatigue, light-headedness, cold extremities, insomnia, paraesthesia and dryness of the mouth. Cardiac insufficiency, hypotension and AV block have occurred on rare occasions.

Adverse effects to bendrofluazide are uncommon at low dosage. Hypokalaemia may occur, particularly in patients with renal or hepatic impairment, and usually manifests as muscle weakness. Potassium depletion is particularly dangerous in digitalised patients. Coma may be precipitated in hepatic cirrhosis. Other reported adverse reactions include hyperuricaemia, hyperglycaemia, gastro-intestinal upset, jaundice, pancreatitis, blood dyscrasias and skin rashes associated with photosensitivity.

Overdosage or Exaggerated Response: Excessive bradycardia should be treated initially with atropine. If there is no response, isoprenaline may be administered with caution. Cardiac failure should be managed by digitalisation and diuretics. Hypotension may be managed with vasopressors such as adrenaline. Bronchospasm may be counteracted by isoprenaline and aminophylline.

Pharmaceutical precautions Store at room temperature, protected from excessive heat and moisture in a tightly closed container.

Legal category POM.

Package quantities Bottles of 100 tablets.

Further information Corgaretic tablets simplify the treatment of hypertension by increasing patient acceptability and dosage flexibility. The two available strengths allow increasing the dose of the beta-blocker nadolol, without necessarily increasing the bendrofluazide dosage.

Nadolol has been reported to increase renal blood flow especially through the cortical nephrons.

Nadolol has negligible lipid solubility.

Corgaretic 80 0034/0213

FLORINEF* TABLETS

Presentation *Tablets 0.1 mg:* Round, pale pink tablets, scored on one side and engraved Squibb and 429 on reverse, containing 0.1 mg fludrocortisone acetate.

Tablets 1 mg: Round, pink tablets, scored on one side and engraved Squibb on the reverse, containing 1 mg fludrocortisone acetate.

Uses *Actions:* Qualitatively, the physiological action of fludrocortisone acetate is similar to hydrocortisone. In very small doses, fludrocortisone maintains life in adrenalectomised animals, enhances the deposition of liver glycogen and produces thymic involution, eosinopenia, retention of sodium and increased urinary excretion of potassium.

Indications: The treatment of Addison's disease and adrenal hyperplasia.

Dosage and administration *Adult dosage—Addison's disease:* A daily dosage range of 0.1–0.3 mg Florinef tablets orally produces satisfactory salt retention in patients with Addison's disease. Supplementary parenteral administration of sodium-retaining hormones is not

necessary. When an enhanced glucocorticoid effect is desirable, cortisone or hydrocortisone by mouth should be given concomitantly with Florinef tablets; the suggested daily oral dosage range for cortisone is 6.2–25 mg, and for hydrocortisone, 5–20 mg.

Adrenal hyperplasia: Satisfactory long-term inhibition of endogenous adrenal cortical secretion has been achieved with daily doses of 1 mg or 2 mg of Florinef tablets orally. This dosage range has been found to maintain the 17-ketosteroid excretion at or near normal levels. Since Florinef tablets may have an intense mineralocorticoid activity, it may be necessary to administer concomitantly potassium chloride. Restriction of dietary sodium intake may be required to prevent excessive salt and water retention.

Children: May be used adjusted to the age and weight of the child according to the severity of the condition.

Contra-indications, warnings, etc

Contra-indications: In latent or healed tuberculosis; the presence of local or systemic viral infection; in acute psychoses and in patients with an active peptic ulcer; acute glomerulonephritis and in active infections not controlled by antibiotics.

Corticosteroids are not indicated for patients with myasthenia gravis, diverticulitis, recent intestinal anastomoses, thrombophlebitis, psychotic tendencies, essential anthermatous disease, chronic nephritis, metastatic carcinoma, osteoporosis, and a history of peptic ulcer.

In the presence of any of these conditions, the need for corticosteroid therapy must be carefully weighed against possible deleterious effects.

Precautions and warnings: Due to its strong mineralocorticoid effect, the clinical use of Florinef is limited to such conditions as Addison's disease and adrenal hyperplasia.

Corticosteroids are not recommended for pregnant patients, particularly in the first trimester, except where the disease for which they are indicated warrants their use.

Side-effects: Arise from the glucocorticoid and mineralocorticoid actions of Florinef tablets. Cushingoid changes, or other signs of fat deposition; weakness; bruising or purpura; striae; osteoporosis; spontaneous fractures; sweating or flushing of the face; thromboembolism; necrotising angitis; acute pancreatitis; ulcerative oesophagitis; activation or aggravation of peptic ulcer or other gastro-intestinal upsets; oedema; hypertension; hirsutism; acneiform eruptions; vertigo; headache; severe mental disturbances. Increased intracranial pressure, papilloedema and posterior subcapsular cataracts have also been associated with prolonged corticosteroid administration.

Where adverse reactions do occur they are usually reversible following cessation of therapy.

Overdosage: A single large dose should be treated with plenty of water by mouth. Careful monitoring of serum electrolytes is essential, with particular consideration being given to the need for administration of potassium chloride and restriction of dietary sodium intake.

Pharmaceutical precautions *Storage:* At room temperature.

Legal category POM.

Package quantities *Florinef Tablets 0.1 mg:* Bottles of 100.

Florinef Tablets 1 mg: Bottles of 30.

**JINGILIN® CREAM AND OINTMENT
JINGILIN® IN ORABASE®**

Presentation *Cream*: Yellow containing amphotericin 100,000 units (30 mg) per gram.

Ointment: Yellow containing amphotericin 30,000 units (0 mg) per gram in Plastibase®.

Jingilin in Orabase: Yellow, crystalline paste containing amphotericin 20,000 units (20 mg) per gram Orabase® (gelatin, pectin and sodium carboxymethylcellulose in Plastibase®).

Uses *Actions*: Amphotericin is a polyene antifungal antibiotic active against a wide range of yeasts and yeast-like fungi including *Candida albicans*.

Indications: Cream and Ointment are indicated for cutaneous or mucocutaneous infections caused by susceptible fungi, particularly *C. albicans*.

Fungilin in Orabase is indicated for mycotic infections of the oral and perioral areas, including angular cheilitis, oral candidosis, dental trauma, ulcerative gingivitis and acute inflammatory gingivitis, glossitis and pericoronitis.

Dosage and administration *Cream and Ointment* could be applied two to four times daily.

Fungilin in Orabase should be applied two to four times daily, depending on the severity of the condition. Apply to the affected area; do not rub in.

Contra-indications, warnings, etc

Contra-indications: There are no known contra-indications.

Precautions: No special precautions apply.

Side-effects: No systemic or allergic reactions have been reported.

Pharmaceutical precautions *Storage: Cream*: At room temperature; avoid freezing.

Ointment: At room temperature.

Jingilin in Orabase: At room temperature.

Dilution: Fungilin topicals should not be diluted as this may reduce therapeutic efficacy.

Legal category POM.

Package quantities *Cream/Ointment*: 15 g tubes.

Jingilin in Orabase: Tubes of 10 g.

Further information Nil.

Product licence numbers

JINGILIN® LOZENGES, SUSPENSION AND TABLETS

Presentation *Lozenges*: Round, pale yellow, engraved 29 and Squibb, containing 10,000 units (10 mg) amphotericin.

Suspension: Orange-flavoured, viscous suspension containing 100,000 units (100 mg) amphotericin per ml.

Tablets: Yellow to tan, scored one side and engraved Squibb and 430 on reverse, containing 100,000 units (100 mg) amphotericin.

Uses *Actions*: Amphotericin is an antifungal antibiotic active against a wide range of yeasts and yeast-like fungi including *Candida albicans*. Absorption from the gastrointestinal tract is negligible even with very large doses. Extensive clinical experience has not shown problems of toxicity or sensitisation.

Indications: *Lozenges/Suspension*: For the treatment of candidal lesions (thrush) of the oral and perioral areas. The suspension may be used in the treatment of denture stomatitis.

Suspension/Tablets: For the suppression of the intestinal reservoir of *C. albicans* which may precipitate cutaneous or vaginal candidosis.

Dosage and administration *Adult dosage: Lozenges*: Dissolve 1 slowly in the mouth four times a day. Depending on the severity of infection, the dose may be increased to 8 lozenges daily.

To clear the condition fully may require 10-15 days' treatment.

Suspension: For denture stomatitis and oral infections caused by *C. albicans*, 1 ml should be placed in the mouth four times daily; it should be kept in contact with lesions for as long as possible.

For the treatment or suppression of intestinal candidosis, 2 ml four times daily.

Tablets: 1 or 2 tablets four times daily.

Administration of Fungilin for oral and intestinal candidosis should be continued for 48 hours after clinical cure to prevent relapse.

Infants and children: Suspension: For intestinal and oral candidosis, 1 ml should be dropped into the mouth four times daily. The suspension should be held in contact with oral lesions for as long as possible before swallowing.

For prophylaxis in the newborn, the suggested dose is 1 ml daily.

Contra-indications, warnings, etc

Contra-indications: There are no known contra-indications to the use of amphotericin.

Precautions: No special precautions apply.

Side-effects: Gastro-intestinal side-effects have occasionally been reported following continuous administration of amphotericin for several months in daily doses in excess of 3 g. These have been mild in nature and have readily cleared on cessation of treatment. No systemic toxic effects or allergic reactions have been associated with its oral use.

Overdosage: Since absorption of amphotericin from the gastro-intestinal tract is negligible, overdosage causes no systemic toxicity.

Pharmaceutical precautions *Storage: Lozenges/Tablets*: At room temperature.

Suspension: Cool place; protect from direct sunlight.

Dilution: Fungilin Suspension should not be diluted prior to use; it is formulated to coat and adhere to the oral lesions being treated.

Legal category POM.

Package quantities *Lozenges*: 20 in a tube.

Tablets: Bottles of 20.

Suspension: 12 ml bottles with graduated dropper.

Further information Nil.

FUNGILIN* PESSARIES

Presentation Pale yellow, diamond-shaped, with Squibb logo engraved on one side, containing amphotericin 50,000 units (50 mg).

Uses *Actions:* Amphotericin is an antifungal antibiotic active against a wide range of yeasts and yeast-like fungi including *Candida albicans*.

Indications: Local treatment of vulvovaginal candidosis.

Dosage and administration *Adults:* 1 or 2 pessaries should be inserted high into the vagina for 14 consecutive nights or longer regardless of any intervening menstrual period.

Re-infection from the candidal content of the intestinal tract may be prevented by concomitant therapy with oral amphotericin.

Fungilin Cream or Ointment should be applied to the perineal region if necessary.

Children: Vulvovaginal candidosis is rarely a problem in children. Dosage should be as for adults together with concomitant oral amphotericin medication where necessary. Oral dosage should be 100 mg four times a day.

Contra-indications, warnings, etc

Contra-indications: There are no known contra-indications to the use of this product.

Precautions: No special precautions apply.

Side-effects: Fungilin is well tolerated and no systemic effects or allergic reactions have been reported.

Pharmaceutical precautions *Storage:* At room temperature.

Legal category POM.

Package quantities 15 in foil strips.

Further information Nil.

Product licence number 0034/5037.

FUNGIZONE* INTRAVENOUS

Presentation Each vial contains as a yellow, fluffy powder: amphotericin 50,000 units (50 mg), sodium desoxycholate approximately 41 mg, with sodium phosphate buffer.

Uses *Actions:* Amphotericin is a polyene antifungal antibiotic active against a wide range of yeasts and yeast-like fungi including *Candida albicans*. Crystalline amphotericin is insoluble in water; therefore, the antibiotic is solubilised by the addition of sodium desoxycholate to form a mixture which provides a colloidal dispersion for parenteral administration. Amphotericin is fungistatic rather than fungicidal in concentrations obtainable in body fluids. It probably acts by binding to sterols in the fungal cell membrane with a resultant change in membrane permeability which allows leakage of intracellular components. Amphotericin is slowly excreted by the kidneys. The cumulative urinary output

over a seven-day period amounts to approximately 40% of the amount of drug infused. No strains of *Candida* resistant to amphotericin have been reported in clinic use, and although *in vitro* testing does produce a small number of resistant isolates this occurs only following repeated subcultures.

Indications: Fungizone Intravenous should be administered primarily to patients with progressive, potential fatal infections. This potent drug should not be used to treat the common forms of fungal disease which show only positive skin or serological tests.

Fungizone Intravenous is specifically intended to treat cryptococcosis (torulosis); North American blastomycosis; the disseminated forms of candidosis, coccidioidomycosis and histoplasmosis; mucormycosis (phycomycosis) caused by species of the genera *Mucor*, *Rhizopus*, *Aspidium*, *Entomophthora*, and *Basidiobolus*; sporotrichosis (*Sporotrichum schenckii*), aspergillosis (*Aspergillus fumigatus*).

Amphotericin may be helpful in the treatment of American mucocutaneous leishmaniasis but is not the drug of choice in primary therapy.

Dosage and administration *Adults and children:* Fungizone should be administered by slow intravenous infusion over a period of six hours. Initial daily dose should be 0.25 mg/kg of body weight gradually increasing to a level of 1.0 mg/kg of body weight depending on individual response and tolerance. Within the range of 0.25-1.0 mg/kg the daily dose should be maintained at the highest level which is not accompanied by unacceptable toxicity.

In seriously ill patients the daily dose may be gradually increased up to a total of 1.5 mg/kg. Since amphotericin is excreted slowly, therapy may be given on alternate days in patients on the higher dosage schedule. Several months of therapy are usually necessary; a shorter period of therapy may produce an inadequate response and lead to relapse.

Caution: Under no circumstances should a total daily dose of 1.5 mg/kg be exceeded. The recommended concentration for intravenous infusion is 0.1 mg per ml (100 units per ml).

Contra-indications, warnings, etc

Contra-indications: Those patients who are hypersensitive to amphotericin, unless, in the opinion of the physician, the condition requiring treatment is life threatening and amenable only to such therapy.

Precautions: Prolonged therapy with amphotericin is usually necessary. Unpleasant reactions are quite common when the drug is given parenterally at therapeutic dosage levels. Some of these reactions are potentially dangerous. Hence amphotericin should be used parenterally only in hospitalised patients, or those under close clinical observation. If the BUN exceeds 40 mg per 100 ml, or the serum creatinine exceeds 3.0 mg per 100 ml the drug should be discontinued or the dosage markedly reduced until renal function is improved. Weekly blood counts and serum potassium determinations are also advisable. Low serum magnesium levels have also been noted during treatment with amphotericin. Therapy should be discontinued if liver function test results (elevated bromsulphalein, alkaline phosphatase and bilirubin) are abnormal.

Corticosteroids should not be administered concomitantly unless they are necessary to control drug reaction. Other nephrotoxic antibiotics and antineoplastic agents should not be given concomitantly except with great

sution. Whenever medication is interrupted for a period longer than seven days, therapy should be resumed by starting with the lowest dosage level, i.e. 0.25 mg/kg of body weight and increased gradually as outlined under 'dosage'.

Safety for use in pregnancy has not been established; therefore it should be used during pregnancy only if the possible benefits to be derived outweigh the potential risks involved.

Side-effects: While some patients may tolerate full intravenous doses of amphotericin without difficulty, most will exhibit some intolerance, often at less than the full therapeutic dosage. They may be made less severe by giving aspirin, antihistamines or antiemetics. Administration of the drug on alternate days may decrease nausea and phlebitis. Intravenous administration of small doses of adrenal corticosteroids just prior to or during the amphotericin infusion may decrease febrile reactions. The dosage and duration of such corticosteroid therapy should be kept to a minimum. Adding a small amount of heparin to the infusion may lessen the incidence of thrombophlebitis and coagulation problems. Extravasation may cause chemical irritation. The adverse reactions that are most commonly observed are: fever (sometimes with shaking chills), headache, anorexia, weight loss, nausea and vomiting, malaise, muscle and joint pains, dyspepsia, cramping epigastric pain, diarrhoea, local venous pain at the injection site with phlebitis and thrombophlebitis, normochromic normocytic anaemia and hypokalaemia. Abnormal renal function, which usually improves upon interruption of therapy, is also commonly observed; however, some permanent impairment often occurs, especially in those patients receiving large amounts (over 5 g) of amphotericin. The following adverse reactions occur less frequently or rarely: anuria (oliguria); cardiovascular toxicity including arrhythmias, ventricular fibrillation, cardiac arrest, hypotension; maculopapular rash; tinnitus; transient vertigo; blurred vision, or diplopia; convulsions and pruritus. Hepatotoxicity has been suggested.

Pharmaceutical precautions *Storage:* Vials of powder for reconstitution should be stored in a refrigerator. See package insert for storage after reconstitution and constitution directions.

Legal category POM.

Package quantities Vials of 50 mg.

Further information Nil.

Product licence number 0034/5041.

RANEODIN* OINTMENT AND OPHTHALMIC OINTMENT

Presentation Pale greenish yellow, containing neomycin sulphate 2.5 mg and gramicidin 0.25 mg per gram. Graneodin Ophthalmic Ointment is sterile.

Uses *Actions:* Neomycin is active against a wide range of Gram-positive and Gram-negative bacteria, including many of the organisms responsible for bacterial skin infections.

Gramicidin is active against Gram-positive bacteria and supplements the action of neomycin against the many common skin pathogens found in this group.

Indications—Topical: Superficial bacterial infections such

as impetigo; impetiginised eczema; infected eczema; furuncles; syphilis barbae; folliculitis; ecthyma; chronic ulcers of the skin; scratches or abrasions; bacterial infections of the ear.

For prophylaxis against infections following minor surgery.

Ophthalmic: Infections of the eyelids such as hordeolum, Meibomium cysts, blepharitis. Corneal or conjunctival infections.

Dosage and administration *Adults and children—*

Topical: To be applied two to four times a day. Any crusts should be removed and the ointment rubbed well in.

Ophthalmic: Half an inch of the ointment should be applied to the inside of the eyelid.

Contra-indications, warnings, etc

Contra-indications: Fungal or viral infections of the skin or for the treatment of deep-seated infections. These preparations are contra-indicated in persons with known sensitivity to neomycin.

Precautions: The possibility of sensitivity to neomycin should be taken into consideration especially in the treatment of patients suffering from leg ulcers. Since the use of occlusive dressings may increase the risk of sensitivity reactions such dressings should be avoided.

Side-effects: Sensitivity reactions to neomycin may occur especially with prolonged use. Gramicidin sensitivity has occasionally been reported.

Pharmaceutical precautions *Storage:* At room temperature.

Dilution: Not recommended.

Legal category POM.

Package quantities *Ointment:* Tubes of 15 g.

Ophthalmic Ointment: Tubes of 3.6 g.

Further information Nil.

Product licence numbers

Graneodin Ointment 0034/5042

Graneodin Ophthalmic Ointment 0034/5043

HALCIDERM* TOPICAL

Presentation A white topical preparation containing halcinonide 0.1% in a water-miscible base.

Uses *Actions:* Halcinonide is a potent corticosteroid with rapid anti-inflammatory, antipruritic and anti-allergic actions.

Halciderm is suitable for both wet and dry lesions.

Indications: Halciderm is indicated in acute and chronic corticosteroid-responsive conditions which may include: psoriasis, atopic eczema, contact eczema, follicular eczema, infantile eczema, neurodermatitis, anogenital eczema (pruritus ani et vulvae), nummular eczema, seborrhoeic or flexural eczema, otitis externa.

Dosage and administration *Adults and children:*

Halciderm should be applied to the affected area two, or occasionally three, times daily. In long-term therapy, or where lower strength preparations are required, do not dilute but use intermittently.

Contra-indications, warnings, etc

Contra-indications: Halciderm is contra-indicated in

tuberculous and most viral lesions of the skin, particularly herpes simplex, vaccinia and varicella. It should not be used in fungal or bacterial skin infections without suitable concomitant antimicrobial therapy. It is not intended for ophthalmic use, nor should it be applied in the external auditory canal of patients with perforated eardrums.

Precautions: In infants, long-term continuous topical steroid therapy should be avoided. Adrenal suppression may occur, even without occlusion. Topical administration of corticosteroids to pregnant animals can cause abnormalities of foetal development. The relevance of this finding to humans has not been established. However, topical corticosteroids should not be used extensively in pregnancy, i.e. in large amounts or for long periods.

Side-effects: Halciderm is well tolerated. Local irritation is not common.

Pharmaceutical precautions *Storage:* Halciderm should be stored in a cool place.

Dilution: Due to special formulation of topical Halciderm, normal dermatological diluents should not be used. For further information consult the manufacturer.

Legal category POM.

Package quantities Tubes containing 15 g and 30 g.

Further information Halciderm contains halcinonide 0.1%, of which approximately half is present as microcrystals, while the remainder is dissolved in the non-aqueous phase. This formulation is designed to permit immediate utilisation of the steroid and to ensure that its activity is maintained for relatively prolonged periods.

Product licence number 0034/0160.

HYDREA* CAPSULES

Presentation Pink, opaque capsule body with green, opaque cap, both parts printed Squibb and 830 in black, containing hydroxyurea 500 mg.

Uses *Actions:* Hydroxyurea is an orally active antineoplastic agent. Although the mechanism of action has not yet been clearly defined, hydroxyurea appears to act by interfering with synthesis of DNA.

Indications: Active against a wide range of malignant lesions. Hydrea is particularly effective in the management of chronic myeloid leukaemia.

Hydrea is indicated for the treatment of malignant neoplastic disease, e.g. chronic leukaemias, acute leukaemias, Hodgkin's disease, multiple myeloma, lymphosarcoma, reticulum cell sarcoma, malignant melanoma, squamous cell carcinoma of the cervix, lung, pharynx, tongue, scalp and other sites, adenocarcinoma of the stomach and colon, breast sarcoma, hypernephroma, testicular tumours, ovarian neoplasms and astrocytoma.

In the treatment of tumours of the head and neck, lung, Hodgkin's disease, astrocytoma and sarcoma, best results have been obtained with concomitant radiotherapy.

Dosage and administration Treatment regimens can be continuous or intermittent. The continuous regimen is particularly suitable for chronic myeloid leukaemia, while the intermittent regimen, with its diminished effect on the bone marrow, is more satisfactory for the management of solid tumours.

Hydrea should be started 7 days before concurrent irradiation therapy.

Continuous therapy: Hydrea 20-30 mg/kg should be given daily in single doses. Dosage should be based on the patient's actual or ideal weight, whichever is the less. Therapy should be monitored by repeat blood count and discontinued if the WBC falls below 3,000 per mm³ or the platelet count below 100,000 per mm³. Hydrea should be resumed when the blood cells have returned to normal levels.

Intermittent therapy: Hydrea 80 mg/kg in single dose should be given every third day. Using the intermittent regimens the likelihood of WBC depression is diminished but if low counts are produced, 1 or more doses of Hydrea should be omitted.

Contra-indications, warnings, etc

Contra-indications: Marked leucopenia, thrombocytopenia, severe anaemia and those who have previously shown hypersensitivity to Hydrea.

Precautions: The myelosuppressive activity may be potentiated by previous or concomitant radiotherapy or cytotoxic therapy. Since Hydrea is a cytotoxic agent it has produced a teratogenic effect in some animal species. This product should not normally be administered to patients who are pregnant, or to mothers who are breastfeeding. Patients undergoing therapy with Hydrea should be monitored by repeat blood counts.

Side-effects: Bone-marrow suppression is the major toxic effect of Hydrea, while leucopenia, thrombocytopenia and anaemia may occur in that order. Other side effects are generally rare, but the following have been reported: anorexia, nausea, vomiting, headache, drowsiness, dizziness, stomatitis, alopecia, skin rash, melana abdominal pain, disorientations, pulmonary oedema, hallucinations, convulsions and potentiation of the erythema caused by irradiation.

Overdosage: Immediate treatment consists of gastric lavage, followed by supportive therapy for the cardio-respiratory systems if required. In the long term, careful monitoring of the haemopoietic system is essential and if necessary, blood should be transfused.

Pharmaceutical precautions *Storage:* At room temperature. Bottles should be kept tightly closed since hydroxyurea is hygroscopic.

Legal category POM.

Package quantities Bottles of 100.

Further information Nil.

Product licence number 0034/5044.

IPRAL* TABLETS

IPRAL* PAEDIATRIC SUSPENSION

Presentation *Tablets:* Round, white tablets engraved Squibb and 513, containing 100 mg trimethoprim.

Round, white tablets engraved Squibb and 514 containing 200 mg trimethoprim.

Paediatric Suspension: White, sugar-free suspensor containing 50 mg trimethoprim per 5 ml.

Uses *Actions:* Trimethoprim is active in-vitro against most pathogenic Gram-positive and Gram-negative bacteria. Exceptions are *Nocardia* species, *Treponem pallidum*, *Pseudomonas aeruginosa*, anaerobic bacteria.

and possibly *Mycobacterium* and *Neisseria* species and *M. rubeola abortus*.

Indications: *Urinary tract:* In the treatment of acute and chronic urinary tract infections and for prophylactic treatment of patients with a tendency to recurrent urinary infections.

Respiratory tract: In the treatment of acute and chronic bronchitis, bronchopneumonia and basal pneumonia.

Ipral is particularly useful for patients sensitive to ulphonamides.

Dosage and administration

Oral Tablets: *Adults and Children over 12 years:* For acute urinary tract and respiratory tract infections, 100 mg twice daily. For long-term and prophylactic therapy of urinary tract infections, 100 mg at night.

Oral Paediatric Suspension: *Children:* Acute treatment: based on a dose of approximately 8 mg/kg/day of trimethoprim:

Up to 12 years: 100 mg (10 ml suspension) twice daily

6 months to 6 years: 50 mg (5 ml suspension) twice daily

3 weeks to 6 months: 25 mg (2.5 ml suspension) twice daily

Ipral Paediatric Suspension may be diluted to half-strength with water, sorbitol or Syrup BP.

Contra-indications, warnings, etc

Contra-indications: Ipral should not be given to patients with severe renal insufficiency where blood levels cannot be monitored regularly. It should not be administered to pregnant women, premature infants nor during the first two months of life. Megaloblastic anaemia.

Precautions: Care is necessary in administration to patients with impaired renal function. Regular haematological examinations should be performed during long-term therapy. Special precautions should be exercised in patients with a predisposition to folate deficiency. Ipral is excreted in breast milk.

Side-effects: Ipral is well tolerated at therapeutic doses with few side-effects. Nausea, vomiting, gastro-intestinal upset and dermatological reactions such as pruritus and rash have been reported. Given over a prolonged period, Ipral may depress haemopoiesis due to an effect on folic acid metabolism. This effect may be reversed by intramuscular administration of 3-5 mg calcium folinate daily for five to seven days.

Treatment of overdose: Symptoms of overdose include diarrhoea and vomiting. Treatment is symptomatic and gastric lavage and forced diuresis may be used. Calcium folinate may be used to counteract any effect of Ipral on bone-marrow.

Pharmaceutical precautions *Storage:* Ipral tablets and suspension should be stored in closed containers at room temperature.

Legal category POM.

Package quantities

100 mg Tablets: Packs of 100 tablets.

200 mg tablets: Packs of 100 and 500 tablets.

Suspension: Bottles of 100 ml.

Further information Absorption from the oral route is rapid, and peak plasma levels are obtained between one and four hours. Ipral is well distributed throughout the tissues and is excreted, predominantly unchanged, in the urine.

Product licence numbers

KENALOG* INTRA-ARTICULAR/INTRAMUSCULAR

Presentation Sterile, aqueous suspension of triamcinolone acetonide 40 mg per ml.

Uses Triamcinolone acetonide is a synthetic glucocorticoid with marked anti-inflammatory and anti-allergic actions.

Intra-articular injection: Following the local injection of Kenalog, relief of pain and swelling, with greater freedom of movement, is usually obtained within a few hours.

Intramuscular injection: Provides an extended duration of therapeutic effect and fewer side-effects of the kind associated with oral corticosteroid therapy, particularly gastro-intestinal reactions such as peptic ulceration. Studies indicate that, following a single intramuscular dose of 80 mg triamcinolone acetonide, adrenal suppression occurs within 24-48 hours and then gradually returns to normal, usually in approximately three weeks. This finding correlates closely with the extended duration of therapeutic action of triamcinolone acetonide.

Indications *Intra-articular injections of Kenalog* are indicated for alleviating the joint pain, swelling and stiffness associated with rheumatoid arthritis, osteoarthritis; also for acute and subacute bursitis, epicondylitis, tendinitis and acute, non-specific tenosynovitis.

Intramuscular injections of Kenalog are indicated where depot corticosteroid treatment is required, including certain allergic and dermatological conditions and connective tissue disorders. In seasonal allergies, remission of symptoms over the entire period may be achieved with a single intramuscular injection. It is not indicated in children under six years.

Dosage and administration

Kenalog intra-articular/intramuscular injection is not for intravenous use.

Intra-articular injection: For intra-articular administration or injection into tendon sheaths and bursae, the dose of Kenalog injection may vary from 5 mg to 10 mg (0.125-0.25 ml) for smaller joints and up to 40 mg (1 ml) for larger joints, depending on the specific disease entity being treated. Single injections into several sites for multiple joint involvement, up to a total of 80 mg, have been given without undue reactions.

It is recommended that, when injections are given into the sheaths of short tendons, Adcortyl injection (triamcinolone acetonide 10 mg/ml) should be used.

N.B. Strict aseptic precautions should be observed.

Intramuscular injection: *Adults and children over 12 years:* The suggested initial dose is 40 mg (1 ml) injected deeply into the upper, outer quadrant of the gluteal muscle. Subsequent dosage depends on the patient's response and period of relief. Patients with hay fever or pollen asthma who do not respond to conventional therapy may obtain a remission of symptoms lasting throughout the pollen season after a dose of 40-100 mg.

For children from 6-12 years of age: The suggested initial dose of 40 mg (1 ml) injected deeply into the gluteal muscle should be scaled according to the severity of symptoms and the age and weight of the child.

Since the duration of effect is variable, subsequent doses should be given when symptoms recur and not at set intervals.

Contra-indications, warnings, etc

Contra-indications: *Intra-articular injection* is contra-indicated in the presence of active infection in or near joints. The preparation should not be used to alleviate joint pain arising from infectious states such as gonococcal or tubercular arthritis.

Systemic corticosteroids are not indicated for patients with myasthenia gravis, diverticulitis, recent intestinal anastomoses, thrombophlebitis, psychotic tendencies, exanthematous disease, chronic nephritis, metastatic carcinoma, osteoporosis and a history of peptic ulcer.

In latent or healed tuberculosis; in the presence of local or systemic viral infection; in acute psychoses and in patients with an active peptic ulcer; in acute glomerulonephritis and in active infections not controlled by antibiotics.

Precautions *Intra-articular injection:* Patients should be specifically warned to avoid over-use of joints in which symptomatic benefit has been obtained. Severe joint destruction with necrosis of bone may occur if repeated intra-articular injections are given over a long period of time. Care should be taken if injections are given into tendon sheaths to avoid injection into the tendon itself.

Due to the absence of a true tendon sheath, the Achilles tendon should not be injected with depot corticosteroids.

Intramuscular injection: During prolonged therapy a liberal protein intake is essential to counteract the tendency to gradual weight loss sometimes associated with negative nitrogen balance and wasting of skeletal muscle.

Corticosteroids are not recommended for pregnant patients, particularly in the first trimester, except when the disease for which they are indicated warrants their use. Hypo-adrenalism may occur in the newborn of mothers receiving corticosteroid therapy.

Diabetes may be aggravated, necessitating a higher insulin dosage. Latent diabetes mellitus may be precipitated. Menstrual irregularities may occur, and this possibility should be mentioned to female patients.

Patients on long-term systemic therapy with Kenalog may require supportive corticosteroid therapy in times of stress (such as trauma, surgery or severe illness), both during the treatment period and for a year afterwards.

N.B. To avoid the danger of subcutaneous fat atrophy, it is important to ensure that *deep intramuscular injection is given into the gluteal site*. The deltoid should not be used. Alternate sides should be used for subsequent injections.

Side-effects *Intra-articular injection:* rarely gives rise to adverse reactions. Pain and other local symptoms may continue for a short time before effective relief is obtained. Local fat atrophy may occur if the injection is not given into the joint space.

Intramuscular injection: Local fat atrophy may occur (see under Precautions). Unwanted effects which may be associated with systemic corticosteroid therapy include: Cushingoid changes or other signs of fat deposition; weakness, bruising or purpura; striae; osteoporosis; spontaneous fractures; sweating or flushing of the face; thromboembolism; necrotising angitis; acute pancreatitis; ulcerative oesophagitis; activation or ag-

gravation of peptic ulcer or other gastro-intestinal upsets; hirsutism; acneiform eruptions; vertigo; headache; or severe mental disturbances. Increased intra-cranial pressure, papilloedema and posterior subcapsular cataracts have also been associated with prolonged corticosteroid administration.

Where adverse reactions occur they are usually reversible on cessation of therapy.

The usual early unwanted corticosteroid effects such as increase in weight, oedema and hypertension, generally do not occur with Kenalog, but, as with other potent corticosteroids, clinical supervision is necessary.

Pharmaceutical precautions *Storage:* At room temperature; avoid freezing.

Legal category POM.

Package quantities Ready filled syringes 1 ml and 2 ml (Intramuscular use only). 1 ml vials: pack of 1 (Intra-articular and intramuscular use).

Further information Nil.

Product licence number 0034/5045.

MODECATE* INJECTION

MODECATE* CONCENTRATE INJECTION

Presentation *Modecate injection:* Straw-coloured, viscous liquid containing fluphenazine decanoate 25 mg per ml in sesame oil.

Modecate Concentrate injection: Straw-coloured, viscous liquid containing fluphenazine decanoate 100 mg per ml in sesame oil. Ampoules are marked with a distinctive blue band.

Uses *Actions:* Fluphenazine decanoate is an ester of the potent neuroleptic fluphenazine, a phenothiazine derivative of the piperazine type. The ester is slowly absorbed from the intramuscular site of injection and is then hydrolysed in the plasma to the active therapeutic agent, fluphenazine.

Indications: For the treatment of psychotic disorders. Whilst Modecate injection has been shown to be effective in acute states, it is particularly useful in the maintenance treatment of chronic patients who are unreliable at taking their oral medication, and also of those who do not absorb their oral phenothiazines in adequate amounts.

Modecate Concentrate injection provides a high concentration of fluphenazine decanoate in a small volume which may be injected without discomfort to the patient and it is therefore particularly suitable for those patients who require higher doses for effective antipsychotic control.

Dosage and administration It is preferable that patients be stabilised on the injection in hospital.

Recommended dosage regimes

1. *Modecate injection 25 mg/ml*

- a) *Patients without previous exposure to a depot fluphenazine formulation:* Initially 0.5 ml (0.25 mg) for patients over 60 by deep intramuscular injection into the gluteal region.

Clinical response or side-effects may be observed within hours and further injections should be administered according to the initial response and severity of the condition.

It is desirable to maintain as much flexibility in the

dose as possible to achieve the best therapeutic response with the least side-effects; most patients are successfully maintained within the dose range 0.5 ml every five weeks to 4 ml every two weeks. In very disturbed patients, much higher doses of Modecate injection have been used in the first week with good results, but are seldom required for more than two months.

-) *Patients previously maintained on depot fluphenazines:* Patients who have suffered a relapse following cessation of depot fluphenazine therapy may be restarted on the same dose as they were receiving formerly, although the frequency of injections may need to be increased in the early weeks of treatment until satisfactory control is obtained.

Modecate Concentrate injection 100 mg/ml: Patients found to require the larger volumes of Modecate 5 mg/ml, for example in excess of 2 ml per injection, may be transferred directly to the equivalent dose of Modecate Concentrate on the basis that 1 ml Modecate Concentrate Injection is equivalent to 4 ml Modecate injection.

Contra-indications, warnings, etc

Contra-indications: Patients with marked cerebral atherosclerosis, phaeochromocytoma, renal or liver failure, or severe cardiac insufficiency. Modecate is not recommended for the treatment of anxiety and tension states, or geriatric confusion and agitation.

Precautions: Fluphenazine decanoate is not intended for use in children under 12 years of age. Caution over the dosage should be exercised in those patients, particularly the elderly, who have experienced marked extra-pyramidal reactions on oral phenothiazines or similar drugs.

Pregnancy: Although there is no clinical evidence to suggest that Modecate is teratogenic, the precise risk associated with its use in the first trimester of pregnancy remains unknown.

Lursing mothers: Breast feeding is not recommended in women receiving Modecate.

Side-effects: 1. *Extra-pyramidal. Acute dystonic reactions* occur infrequently but nearly always within the first 24-48 hours, and may include such dramatic manifestations as oculogyric crises and opisthotonos. They are rapidly relieved by intravenous administration of an antiparkinsonian agent such as procyclidine.

Parkinsonian-like states may occur particularly between the second and fifth days after each injection, but often decrease with subsequent injections. These reactions may be reduced by using smaller doses more frequently, or by the concomitant use of antiparkinsonian drugs such as benzhexol, bntropine or procyclidine.

With careful monitoring of the dose as few as 10% of patients may require antiparkinsonian drugs.

Adverse dyskinesia, similar to that associated with long-term oral neuroleptic therapy, has been reported in patients receiving Modecate injections. Bearing in mind that the movements may go unnoticed by the patient or be suppressed at the time of interview, periodic enquiry and observation are advised.

2. *Other:* As with other phenothiazines, drowsiness, atargy, blurred vision, dryness of mouth, constipation, mild hypotension, impairment of judgement and mental kills, epileptiform attacks, jaundice, abnormal lactation or menstruation and granulocytopenia are occasionally seen. Persistent oral dyskinesias, abnormal skin pigmentation and lens opacities, while sometimes seen following

long-term administration of phenothiazines, have not been reported following the use of Modecate alone. However, their possible occurrence should be considered.

While the injections produce some discomfort at the site of the injection, they seldom cause marked pain, and infections and abscesses are rare.

Overdosage: It should be treated symptomatically and supportively. Extrapyramidal reactions will respond to oral or parenteral antiparkinsonian drugs such as procyclidine or bntropine. In cases of severe hypotension, all procedures for the management of circulatory shock should be instituted, e.g. vasoconstrictors and/or intravenous fluids. However, only the vasoconstrictors metaraminol or noradrenaline should be used, as adrenaline may further lower the blood pressure through interaction with the phenothiazine.

Pharmaceutical precautions *Storage:* At room temperature. Do not store in a refrigerator, since this will cause precipitation of triglycerides from the sesame oil. If precipitation does occur, warming the product to 37°C will dissolve the precipitate without harming the active ingredient. Protect from direct sunlight.

Legal category POM.

Package quantities *Modecate Injection 25 mg/ml:* Ampoules 0.5 ml, 1 ml and 2 ml; Ready-filled syringes of 1 ml, 2 ml; Multidose vials of 10 ml.

Modecate Concentrate Injection 100 mg/ml: Ampoules 0.5 ml and 1 ml.

Further information Nil.

MODITEN® ENANTHATE INJECTION

Presentation Straw-coloured, viscous liquid containing fluphenazine enanthate 25 mg per ml in sesame oil.

Uses *Actions:* Fluphenazine enanthate is an ester of the potent neuroleptic, fluphenazine, a phenothiazine derivative of the piperazine type. The ester is slowly absorbed from the intramuscular site of injection and is then hydrolysed in the plasma to the active therapeutic agent, fluphenazine.

Indications: For the treatment of psychotic disorders. Moditen Enanthate is particularly useful in the maintenance treatment of chronic patients who are unreliable at taking their oral medication, and those who absorb their oral phenothiazines in inadequate amounts.

Dosage and administration It is preferable that patients be stabilised on the injection in hospital.

Recommended dosage regimes: 1. *Patients without previous exposure to either of the depot fluphenazines:* Initially 0.5 ml (0.25 ml for patients over 60) by deep intramuscular injection in the gluteal region. Clinical or side-effects may be observed within hours and further injections may be administered according to the initial response and severity of the condition. It is desirable to maintain as much flexibility in the dose as possible to achieve the best therapeutic response with the least side-effects; most patients are successfully maintained

within the dose range 0.5 ml every three weeks to 4 ml every ten days. In very disturbed patients, much higher doses of Moditen enanthate have been used in the first week with good results, but are seldom required for more than two months.

2. Patients previously maintained on depot fluphenazines: Patients who have suffered a relapse following cessation of depot fluphenazine therapy may be restarted on the same dose as they were formerly receiving, although the frequency of injections may need to be increased in the early weeks of treatment until satisfactory control is obtained.

Contra-indications, warnings, etc

Contra-indications: Patients with marked cerebral atherosclerosis, phaeochromocytoma, renal or liver failure, or severe cardiac insufficiency. Moditen Enanthate is not recommended for the treatment of anxiety and tension states or geriatric confusion and agitation.

Precautions: Moditen Enanthate is not intended for use in children under 12 years of age. Caution should be exercised in those who have had marked extrapyramidal reactions on oral phenothiazines or similar drugs, particularly the elderly. Such patients should start on half the normal dose.

Pregnancy: Although there is no clinical evidence to suggest that Moditen Enanthate is teratogenic, the precise risk associated with its use in the first trimester of pregnancy remains unknown.

Nursing mothers: Breast feeding is not recommended in women receiving Moditen Enanthate.

Side-effects: Extrapyramidal: 1. *Acute dystonic reactions:* These occur infrequently but nearly always within the first 24-48 hours, and include such dramatic manifestations as oculogyric crises and opisthotonos. They are rapidly relieved by intravenous administration of an anti-Parkinsonian agent such as procyclidine.

2. *Parkinsonism:* Parkinsonian-like states may occur particularly between the second and fifth days after each injection but often decrease with subsequent injections. These reactions may be reduced by using smaller doses more frequently, or by the concomitant use of anti-Parkinsonian drugs such as benzhexol, benzotropine or procyclidine.

With careful monitoring of the dose as few as 10% of patients may require anti-Parkinsonian drugs.

3. *Tardive Dyskinesia:* Similar to that associated with long-term oral neuroleptic therapy, has been reported in patients receiving Moditen Enanthate injections. Bearing in mind that the movements may go unnoticed by the patient or be suppressed at the time of interview, periodic enquiry and observation are advised.

4. *Other:* As with other phenothiazines, drowsiness, lethargy, blurred vision, dryness of mouth, constipation, mild hypotension, impairment of judgement and mental skills, epileptiform attacks, jaundice, abnormal lactation or menstruation and granulocytopenia are occasionally seen. Persistent oral dyskinesias, abnormal skin pigmentation and lens opacities, while sometimes seen following long-term administration of phenothiazines, have not been reported following the use of Moditen Enanthate alone. However, their possible occurrence should be considered.

While the injections produce some discomfort at the site of injection, they seldom cause marked pain, and infections and abscesses are rare.

Overdosage: It should be treated symptomatically and

supportively. Extrapyramidal reactions will respond to oral or parenteral anti-Parkinsonian drugs such as procyclidine or benzotropine. In cases of severe hypotension all procedures for the management of circulatory shock should be instituted, e.g. vasoconstrictors and/or intravenous fluids. However, only the vasoconstrictor metaraminol or noradrenaline should be used as adrenaline will further lower the blood pressure through interaction with the phenothiazine.

Pharmaceutical precautions *Storage:* At room temperature. Do not store in a refrigerator, since this will cause precipitation of triglycerides from the sesame oil. If precipitation does occur, warming the product to 37°C will dissolve the precipitate, without harming the active ingredient. Protect from direct sunlight.

MODITEN* TABLETS

Presentation *Tablets 1 mg:* Round, pink, sugar coated tablets containing 1 mg fluphenazine hydrochloride.

Tablets 2.5 mg: Round, yellow, sugar-coated tablet containing 2.5 mg fluphenazine hydrochloride.

Tablets 5 mg: Round, white, sugar-coated tablets printed in green with Squibb and 877, containing 5 mg fluphenazine hydrochloride.

Uses *Actions:* Fluphenazine is a phenothiazine derivative of the piperazine type, its principal actions being those of tranquillisation and anti-emesis.

Indications: Moditen is indicated for the treatment of anxiety and tension, behaviour disorders in children, geriatric confusion and agitation, acute chronic psychoses, the management of psychomotor over-activity and hostility associated with schizophrenia, mania psychoses due to organic brain disease and senile psychoses.

Dosage and administration Because of its inherent length of activity only a single daily dose at breakfast is necessary. However, daily doses may be divided if so desired.

Anxiety and tension states (adults only): Initially 1-2 mg daily rising to 2-4 mg if necessary according to response. It is advised that 1 mg tablets be prescribed for this indication.

Geriatric confusion and agitation: Initially 1 mg daily adjusted according to response.

Behaviour disorders in children: Initially 0.25-0.5 mg daily, rising if necessary to 0.5 or 1 mg according to age and response.

Psychoses and severe behaviour disorders in children Initially 2.5-10 mg daily depending on the severity and duration of symptoms, rising to 20 mg daily as necessary. Doses exceeding 20 mg daily should be used with caution.

Contra-indications, warnings, etc

Contra-indications: Marked cerebral atherosclerosis

leochromocytoma, renal or liver failure and severe diastolic insufficiency.

cautions and side-effects: Extrapyramidal reactions may occur at daily doses of 3 mg or more and have been reported at lower doses on rare occasions, mostly in elderly patients with cerebral atherosclerosis. These reactions may be reduced by using a smaller dose or by concomitant use of anti-Parkinsonian drugs such as levodopa, benztropine or procyclidine. As with other phenothiazines drowsiness, lethargy, blurred vision, dryness of the mouth, constipation, mild hypotension, impairment of judgement and mental skills, epileptiform attacks, jaundice, lactation, abnormal menstruation and neutropenia are occasionally seen but extremely rarely in doses used for the treatment of anxiety and depression. Persistent oral dyskinesias, abnormal skin pigmentation and lens opacities, while sometimes seen following the long-term administration of high doses of phenothiazines, have not been reported following the use of Moditen alone. However, their possible occurrence should be considered.

overdosage: Overdosage should be treated symptomatically. Gastric lavage or stimulation of vomiting should be attempted in the conscious patient. Extrapyramidal reactions will respond to oral or parenteral anti-Parkinsonian drugs such as procyclidine or benztropine. In cases of severe hypotension all procedures for the management of circulatory shock should be instituted, i.e. vasoconstrictors and/or intravenous fluids. However, only the vasoconstrictors metaraminol or noradrenaline should be used as adrenaline will further lower the blood pressure through interaction with the phenothiazine.

OTIPRESS* TABLETS OTIVAL* TABLETS

description *Motipress Tablets:* Each yellow, triangular-shaped, sugar-coated tablet contains nortriptyline hydrochloride, equivalent to 30 mg nortriptyline base and fluphenazine hydrochloride 1.5 mg.

Motival Tablets: Each pink, triangular-shaped, sugar-coated tablet contains nortriptyline hydrochloride, equivalent to 10 mg nortriptyline base and fluphenazine hydrochloride 0.5 mg.

uses *Actions:* Nortriptyline hydrochloride is a tricyclic antidepressant with more rapid activity and less sedation than the majority of drugs of its class. It possesses some opiate-like properties. It is not a mono-amine oxidase inhibitor.

Fluphenazine hydrochloride is a phenothiazine derivative of the piperazine type, its principal actions being those of tranquillisation and anti-emesis. In accordance with pharmacokinetic studies, nortriptyline and fluphen-

azine have been shown to be equally effective therapeutically whether taken together as a single daily dose, or in divided doses.

Indications: Motipress and Motival tablets are indicated for the treatment of patients suffering from mild to moderate anxiety, depression and mixed anxiety depressive states.

Motipress and Motival tablets are also useful in the treatment of phobic states and in conditions where a loss of concentration, interest and pleasure are a problem.

Dosage and administration *Motipress Tablets:* **Adults:** 1 tablet daily, preferably before retiring. This formulation is not indicated for the treatment of children.

Motival Tablets: **Adults:** The dose range is 1 tablet two to four times daily. Most patients respond to 1 tablet three times daily and very few patients require a dose in excess of this. This formulation is not indicated for the treatment of children.

Contra-indications, warnings, etc

Contra-indications: Motipress or Motival tablets should not be given to patients with a history of grand mal or organic brain damage. It is inadvisable to give mono-amine oxidase inhibitors (MAOIs) with Motipress or Motival tablets, nor should they be given within two weeks of cessation of treatment with a MAOI.

Precautions: Should be given with caution to patients with glaucoma and to those who have a propensity for urinary retention. Interactions with barbiturates, alcohol and narcotic drugs may occur, so central nervous depressants should be administered with caution. Motipress and Motival tablets may diminish the antihypertensive effect of adrenergic blocking agents and could potentiate the pressor response to locally injected sympathomimetic agents.

Although there has been no evidence of teratogenicity with fluphenazine or nortriptyline separately, or in combination, caution should be exercised with the use of Motival or Motipress in pregnancy.

Side-effects: Mild side-effects which include dryness of the mouth, drowsiness, faintness and constipation occur infrequently. Occasionally tachycardia, nasal congestion, blurred vision and excitement are seen.

Drowsiness is more likely to occur with Motipress tablets if taken on waking, e.g. in the morning.

Extrapyramidal reactions are unlikely to occur with this dose of fluphenazine alone, and it is probable that the anticholinergic activity of nortriptyline affords protection against such effects. This latter protection would be valuable in the event of overdosage.

Overdosage: Overdosage should be treated symptomatically and supportively. If the patient is conscious, prompt gastric lavage, dilution of the stomach contents to delay absorption, or stimulation of vomiting should be attempted. An open airway should be maintained. Extrapyramidal symptoms are amenable to anti-Parkinsonian drugs. In severe hypotension, all the standard procedures for the management of circulatory shock should be instituted, e.g. vasoconstrictors and/or intravenous fluids. If vasoconstrictors are required, metaraminol, or noradrenaline should be administered but not adrenaline, as this will further lower the blood pressure through interaction with the phenothiazine.

Pharmaceutical precautions *Storage:* At room temperature.

Legal category POM

Package quantities *Motipress Tablets*: 28 day calendar pack, bottles of 250.

Motival Tablets: Bottles of 100 and 500.

Further information Nil.

MYSTECLIN* CAPSULES AND TABLETS

Presentation *Capsules*: Opaque, pink body with opaque, brown cap, both printed Squibb and 885 in white. Each capsule contains 250 mg tetracycline hydrochloride and 250,000 units nystatin.

Tablets: Orange, sugar-coated tablet with Squibb and 677 printed in black, containing tetracycline hydrochloride 250 mg and nystatin 250,000 units.

Uses *Actions*: Tetracycline hydrochloride has a broad antimicrobial activity against pathogenic organisms including many Gram-positive and Gram-negative bacteria, spirochaetes, certain rickettsiae, large viruses, *Mycoplasma pneumoniae* and *Entamoeba histolytica*. After oral administration therapeutically effective blood and urinary levels are obtained in a short period of time. It diffuses readily into most body tissues.

Nystatin is an antifungal antibiotic active against a wide range of yeasts and yeast-like fungi, including *Candida albicans*. Following wide use over many years, no clinical isolates resistant to this compound have emerged. Repeated subculture, *in vitro*, produces a small number of resistant isolates, but with reduced growth rate and pathogenicity. The possibility of these organisms causing disease in man is remote. Extensive clinical experience with nystatin has shown no problems of toxicity or sensitisation.

Indications: For infections caused by organisms sensitive to tetracycline, particularly in patients who may be susceptible to candidal overgrowth. These may include elderly or debilitated patients, diabetics, women taking hormonal contraceptive agents, patients with malignant disease especially if receiving cytotoxic drugs and those patients receiving high doses or prolonged courses of antibiotics or corticosteroids. Representative infections due to susceptible organisms including chronic bronchitis and other respiratory tract infections, urinary tract infections, brucellosis, acne and many mixed infections.

Dosage and administration *Adult dosage*: A minimum dose of 250 mg tetracycline four times daily. This dose may be doubled in severe infections.

Mysteclin should preferably be taken one hour before, or two hours after meals.

Contra-indications, warnings, etc

Contra-indications: The tetracycline group of antibiotics is normally contra-indicated during pregnancy except in certain severe infections where tetracycline may be the drug of choice, and the risk involved is justified.

Administration of tetracyclines in pregnant women may result in hepatic injury, particularly if used for the treatment of pyelonephritis. Tetracyclines are deposited in the skeleton of the human foetus and may result in the depression of bone growth and produce discolouration of the teeth in the child. As tetracycline passes into breast milk, breast feeding is not recommended during Mysteclin therapy. Mysteclin should not be used in patients

with a history of hypersensitivity to the tetracycline group of antibiotics. There are no known contra-indications to the use of nystatin.

Precautions: In treating patients with renal dysfunction since tetracycline may produce azotaemia, hyperphosphataemia, acidosis, weight loss or nausea and vomiting. Absorption of tetracycline from the gut is diminished by milk, salts of calcium, magnesium, aluminium and iron. Lowered absorption also results from alkalies, and concomitant administration of antacids should therefore be avoided.

The effects of anticoagulants are not usually altered by concurrent treatment with tetracycline, although few isolated cases of enhancement have been described. Therefore, occasionally, reduction in doses of concurrent anticoagulants may be required.

Tetracyclines may be deposited in areas of calcification in bones and teeth. The use of drugs of the tetracycline class during tooth development (last half of pregnancy, infancy and childhood to the age of eight years) may cause permanent discolouration of the teeth (yellow-grey-brown). This reaction is more common during long-term use of the drugs but has been observed following repeated short-term courses. Enamel hypoplasia has also been reported. Tetracycline drugs, therefore, should not be used in this age group unless other drugs are unlikely to be effective or are contra-indicated.

There are no special precautions for the oral use of nystatin.

Side-effects: Mysteclin is generally well tolerated but few patients may experience gastro-intestinal side-effects such as nausea, vomiting and diarrhoea.

A phototoxic reaction may be produced in some patients, although such reactions are less common with tetracycline than with other members of the group.

No systemic effects or allergic reactions have been associated with the oral use of nystatin.

Overdosage: The most common symptoms are nausea, vomiting and diarrhoea. The possibility of liver failure occurring should be borne in mind.

Pharmaceutical precautions *Storage*: *Capsule Tablets*: At room temperature.

Legal category POM.

Package quantities *Capsules*: Bottles of 100.
Tablets: Bottles of 100 and 500.

Further information By the inclusion of nystatin with tetracycline, the fungal overgrowth frequently associated with broad-spectrum antibiotic therapy is avoided.

Mysteclin Capsules 0034/5054

Mysteclin Tablets 0034/5056

MYSTECLIN* SYRUP

Presentation Deep orange, viscous liquid, with fruit flavour and containing per 5 ml tetracycline hydrochloride equivalent to tetracycline 125 mg and amphotericin 25 mg.

Uses *Actions*: Tetracycline has a broad antimicrobial activity against pathogenic organisms including many Gram-positive and Gram-negative bacteria, spirochaetes, certain rickettsiae, large viruses, *Mycoplasma pneumoniae* and *Entamoeba histolytica*. After oral a

istration therapeutically effective blood and urinary levels are obtained in a short period of time. It diffuses readily into most body tissues.

Amphotericin is an antifungal antibiotic active against a wide range of yeasts and yeast-like fungi, including *Candida albicans*. Following wide use over many years, clinical isolates resistant to this compound have emerged. Repeated subculture, *in vitro*, produces a small number of resistant isolates, but with reduced growth rate and pathogenicity. The possibility of these organisms causing disease in man is remote.

Indications: For infections caused by organisms sensitive to tetracycline, particularly in patients who may be susceptible to candidal overgrowth. These may include elderly or debilitated patients, diabetics, women taking hormonal contraceptive agents, patients with malignant disease especially if receiving cytotoxic drugs and those patients receiving high doses or prolonged courses of antibiotics or corticosteroids. Representative infections are due to susceptible organisms including chronic bronchitis and other respiratory tract infections, urinary tract infections, brucellosis, acne and many mixed infections.

Dosage and administration *Adult dosage:* A minimum dose of 250 mg tetracycline four times daily. This dose may be doubled in severe infections.

Pediatric dosage: A divided daily dose of 22-44 mg tetracycline per kg should be given according to the type and severity of the infection (see 'Precautions'). Mysteclin Syrup should preferably be taken one hour before, or two hours after meals.

Contra-indications, warnings, etc

Contra-indications: The tetracycline group of antibiotics is normally contra-indicated during pregnancy except in certain severe infections where tetracycline may be the drug of choice and the risk involved is justified. Administration of tetracyclines in pregnant women may result in hepatic injury, particularly if used for the treatment of pyelonephritis. Tetracyclines are deposited in the skeleton of the human foetus and may result in depression of bone growth and produce discolouration of the teeth in the child. As tetracycline passes into breast milk, breast feeding is not recommended during mysteclin therapy. Mysteclin should not be used in patients with a history of hypersensitivity to the tetracycline group of antibiotics. There are no known contra-indications to the use of amphotericin.

Precautions: In treating patients with renal dysfunction since tetracycline may produce azotaemia, hyperphosphataemia, acidosis, weight loss or nausea and vomiting. Absorption of tetracycline from the gut is diminished by milk, salts of calcium, magnesium, aluminium and iron. Impaired absorption also results from alkalis, and concomitant administration of antacids should therefore be avoided.

The effects of anticoagulants are not usually altered by concurrent treatment with tetracycline, although a few isolated cases of enhancement have been described. Therefore, occasionally, reduction in doses of concurrent anticoagulants may be required.

Tetracyclines may be deposited in areas of calcification of bones and teeth. The use of drugs of the tetracycline class during tooth development (last half of pregnancy, infancy and childhood to the age of eight years) may cause permanent discolouration of the teeth (yellow-brown). This reaction is more common during long-term use of the drugs but has been observed following repeated short-term courses. Enamel hypoplasia has also

been reported. Tetracycline drugs, therefore, should not be used in this age group unless other drugs are not likely to be effective or are contra-indicated.

There are no special precautions for the oral use of amphotericin.

Side-effects: Mysteclin is generally well tolerated, but a few patients may experience gastro-intestinal side-effects such as nausea, vomiting and diarrhoea.

A phototoxic reaction may be produced in some patients, although such reactions are less common with tetracycline than with other members of the group.

No systemic effects or allergic reactions have been associated with the oral use of amphotericin.

Overdosage: The most common symptoms are nausea, vomiting and diarrhoea. The possibility of liver failure should be borne in mind.

Pharmaceutical precautions *Storage:* At room temperature, protected from direct sunlight. Once the bottle is opened the contents should be used within two months.

Diluent: Syrup BP. The diluted syrup to be used within two months.

Legal category POM.

Package quantities *Syrup:* Bottles of 100 ml.

Further information By the inclusion of amphotericin with tetracycline, the fungal overgrowth frequently associated with broad-spectrum antibiotic therapy is avoided.

Product licence number 0034/5055.

NOCTEC* CAPSULES

Presentation Clear, orange-red gelatin capsules printed Squibb and 626 in white, each containing 500 mg chloral hydrate in solution.

Uses *Actions:* The hypnotic, chloral hydrate, in doses of 0.5-1 g, produces sedation in approximately 15 minutes followed by sleep in about half an hour. The action of the drug is confined to the cerebral hemispheres and the drug has virtually no effect on REM sleep.

Indications: For insomnia, particularly in geriatric patients who tolerate barbiturates poorly. It is a satisfactory pre-operative sedative and is useful as an hypnotic and sedative during the first stages of labour. In post-operative care and control of pain, Noctec is a valuable adjunct to opiates and analgesics.

Dosage and administration *Adults and children over 12 years of age:* 500 mg to 1 g taken 15 to 30 minutes before bedtime or one to two hours before surgery. Daily dose should not exceed 2 g. The capsules should be taken with water.

Contra-indications, warnings, etc

Contra-indications: In patients with marked hepatic or renal impairment. Large doses should not be used in patients with severe cardiac disease. In the presence of marked gastritis Noctec is best avoided.

Precautions: In patients taking coumarin anticoagulants, when Noctec is withdrawn from the drug regime, or its dosage changed, careful monitoring of the prothrombin time is required.

Noctec should be administered with caution to patients who have previously exhibited an idiosyncrasy or hypersensitivity to chloral hydrate. As with other hyp-

notics, alcohol potentiates the sedative effect. Similarly, there is a danger of misuse and the possibility that habituation may develop.

Side-effects: Few, except gastric irritation which may occur in some patients. Excitement, delirium and tolerance are rarely encountered.

Overdosage: Gastric lavage accompanied by supportive therapy for the cardiovascular and respiratory systems.

Pharmaceutical precautions *Storage:* In a cool place; avoid freezing.

Legal category POM.

Package quantities Bottles of 50 capsules.

Further information Nil.

Product licence number 0034/5057.

NYSTADERMAL* CREAM

Presentation A yellow to light buff cream containing in each gram nystatin 100,000 units and triamcinolone acetonide 0.1%.

Uses *Actions:* Nystatin is an antifungal antibiotic active against a wide range of yeasts and yeast-like fungi, including *Candida albicans*. Triamcinolone acetonide is a potent fluorinated corticosteroid with rapid anti-inflammatory, antipruritic and anti-allergic actions. The cream is formulated for use on moist weeping lesions.

Indications: Nystadermal cream is indicated for those cases of cutaneous candidosis where the addition of a corticosteroid to the antifungal antibiotic may be beneficial in controlling the commonly associated inflammation and pruritus.

Nystadermal cream will also be of benefit in those cases of eczema where *Candida* is either the precipitating cause or present as a secondary invader.

Dosage and administration *Adults and children:* To be applied to moist weeping lesions two to four times daily.

Contra-indications, warnings, etc

Contra-indications: Nystadermal Cream is contra-indicated in tuberculous and most viral lesions of the skin, particularly herpes simplex, vaccinia and varicella. It is also contra-indicated for fungal lesions not susceptible to nystatin and bacterial skin infections.

Precautions: In infants, long-term continuous topical steroid therapy should be avoided as adrenal suppression can occur, even without occlusion. Topical administration of corticosteroids to pregnant animals can cause abnormalities of foetal development. The relevance of this finding to human beings has not been established; however, topical steroids should not be used extensively in pregnancy, i.e. in large amounts or for prolonged periods. However, the unproven theoretical teratogenic hazard must be placed in perspective against the need for steroids to maintain the health of patients.

Side-effects: Side-effects have rarely been reported and have been only mild in nature.

Pharmaceutical precautions *Storage:* At room temperature; avoid freezing.

Dilution: Not recommended, as this may reduce therapeutic efficacy of nystatin.

If necessary, refer to the manufacturer.

Legal category POM.

Package quantities 15 g tubes.

Further information Nil.

Product licence number

Nystadermal Cream 0034/0131

NYSTAN* CREAM, OINTMENT, GEL AND DUSTING POWDER

Presentation *Gel:* Yellow to amber, opaque, containing 100,000 units nystatin per gram.

Cream: Pale buff, containing 100,000 units per gram nystatin in a vanishing-cream base.

Ointment: Yellow to amber containing 100,000 units nystatin per gram in Plastibase*.

Dusting Powder: White to pale yellow, containing 100,000 units nystatin per gram of powder.

Uses *Actions:* Nystatin is an antifungal antibiotic acting against a wide range of yeasts and yeast-like fungi including *Candida albicans*.

Indications: For the treatment of cutaneous and mucocutaneous mycoses, particularly those caused by *albicans*.

Dosage and administration *Adults and children:* be applied two to four times daily.

Contra-indications, warnings, etc

Contra-indications: There are no known contra-indications or special precautions for topical application nystatin.

Side-effects: There have been no substantiated reports of sensitivity associated with topical nystatin.

Pharmaceutical precautions *Storage:*

Gel: In a cool place; avoid freezing.

Cream: At room temperature; avoid freezing.

Ointment: At room temperature.

Dusting Powder: At room temperature, keep tightly closed.

Dilution: Nystan topicals should not be diluted as this may reduce therapeutic efficacy.

If necessary, refer to the manufacturer.

Legal category POM.

Package quantities *Cream/Ointment:* Tubes of 15 g and 30 g.

Gel: Tubes of 30 g.

Dusting Powder: Packs of 15 g.

Further information Nil.

NYSTAN* ORAL SUSPENSION AND TABLETS

Presentation *Oral Suspension:* Yellow, cherry-m flavoured suspension providing 100,000 units nystatin per ml.

N.B. Suspension contains sugar.

Tablets: Sugar-coated, chocolate-brown tablets printed in white with Squibb and 580, containing 500,000 units nystatin.

es Actions: Nystatin is an antifungal antibiotic active against a wide range of yeasts and yeast-like fungi, including *Candida albicans*.

ications: Suspension for the prevention and treatment of candidal infections of the oral cavity, oesophagus and intestinal tract. It provides effective prophylaxis against intestinal candidosis in those born of mothers with vaginal candidosis.

Tablets for intestinal candidosis. They may be used for prophylaxis of candidal overgrowth during courses of broad-spectrum antibiotics.

Usage and administration Adults: *Suspension:* For treatment of denture sores, and oral infections in adults caused by *C. albicans*, 1 ml of the suspension could be dropped into the mouth four times daily; it could be kept in contact with the affected areas as long as possible.

Tablets: For the treatment of intestinal candidosis 1 tablet four times daily, but this dose may be doubled. For prophylaxis a total daily dosage of 1 million units has been found to suppress the overgrowth of *C. albicans* in infants receiving broad-spectrum antibiotic therapy. Older people with intestinal candidosis who are unable to swallow tablets should be given 5 ml of the suspension four times a day.

Administration should be continued for 48 hours after clinical cure to prevent relapse.

Children: *Suspension:* In intestinal and oral candidosis (thrush) in infants and children, 1 ml should be dropped into the mouth four times a day. The longer the suspension is kept in contact with the affected area in the mouth, before swallowing, the greater will be its effect.

For prophylaxis in the newborn the suggested dose is 1 ml once daily.

Contra-indications, warnings, etc

Contra-indications: There are no known contraindications to the use of nystatin.

Precautions: Nystan Oral Suspension contains sugar. In children with disaccharide intolerance a sugar-free formulation is available.

Side-effects: Nausea, vomiting and diarrhoea have occasionally been reported with doses of nystatin exceeding 4 to 5 million units daily. No systemic effects or allergic reactions have been associated with its oral use.

Overdosage: Since the absorption of nystatin from the gastro-intestinal tract is negligible, overdosage causes no systemic toxicity.

Pharmaceutical precautions Storage: *Suspension:* At room temperature; avoid freezing.

Tablets: At room temperature.

Dilution: Not recommended as this may reduce therapeutic efficacy.

If necessary, refer to the manufacturer.

Legal category POM.

Package quantities *Suspension:* Bottles of 30 ml with graduated dropper.

Tablets: Bottles of 28 and 100.

Further information Nil.

Nystan Tablets 0034/5063

NYSTAN* PESSARIES, VAGINAL CREAM AND TRIPLE PACK

Presentation *Pessaries:* Pale yellow to tan, diamond-shaped, with Squibb logo and 457 engraved on one side, containing 100,000 units nystatin.

Vaginal Cream: Pale buff containing in each 4 g application 100,000 units nystatin.

Triple Pack: 28 Nystavescent* pessaries (containing 100,000 units nystatin in an effervescent matrix). 42 oral tablets each containing nystatin 500,000 units and 30 g Nystan Gel (containing 100,000 units nystatin per gram).

Uses **Actions:** Nystatin is an antifungal antibiotic active against a wide range of yeasts and yeast-like fungi, including *Candida albicans*.

Indications: For the treatment of candidal vaginitis. In addition to local therapy the Triple Pack contains tablets for the eradication of *Candida* from the gut and the gel for topical application in the anogenital area, thereby preventing reinfection.

Dosage and administration *Pessaries:* **Adults:** 1 or 2 pessaries should be inserted high into the vagina for 14 consecutive nights or longer, regardless of any intervening menstrual period.

Vaginal Cream: **Adults:** Insert 1 or 2 applications (of 4 g each) high into the vagina for 14 consecutive nights, or longer, regardless of any intervening menstrual period. Reinfection from the candidal content of the intestinal tract may be prevented by concomitant therapy with oral nystatin.

Nystatin Cream, Gel, Ointment or Dusting Powder should be applied to the perineal region 2-4 times daily, if necessary.

Note: To prevent reinfection with *Candida*, the male consort should be treated concurrently with Nystan Gel, applied to the external genital area 2-4 times daily during the treatment period.

Children: Vulvovaginal candidosis is rarely a problem in children. It is suggested that the vaginal cream is the most acceptable formulation for children, together with concomitant oral medication where necessary.

Contra-indications, warnings, etc

Contra-indications: There are no known contraindications to the use of nystatin.

Precautions: In pregnancy, care should be taken while using an applicator to prevent the possibility of mechanical trauma.

Side-effects: Nystan is well tolerated and no substantiated sensitivity reactions have been associated with its use. Some transient local discomfort may be experienced.

Overdosage of Oral Tablets: Since the absorption of nystatin from the gastro-intestinal tract is negligible, overdosage causes no systemic toxicity.

Pharmaceutical precautions Storage: *Pessaries:* At room temperature.

Triple Pack: In a cool, dry place.

Vaginal Cream: At room temperature; avoid freezing.

Dilution: Not recommended for Vaginal Cream as this may reduce therapeutic efficacy.

Legal category POM.

Package quantities *Pessaries:* Foiled, in packs of 15 and 100 with applicators.

Vaginal Cream: Tubes of 60 g with applicator.

Triple Pack: 28 Nystavescent Pessaries in foil strip with applicator. 42 Nystan Oral Tablets. 30 g Nystan Gel. Patient treatment instructions are enclosed.

Further information Nil.

NYSTAVESCENT* PESSARIES

Presentation Pale yellow, diamond-shaped pessaries engraved with Squibb, each containing nystatin 100,000 units in an effervescent matrix.

Uses Actions: Nystatin is an antifungal antibiotic active against a wide range of yeasts and yeast-like fungi, including *Candida albicans*.

Indications: Local treatment of vulvovaginal candidosis.

Dosage and administration One or two pessaries should be inserted high into the vagina for 14 consecutive nights or longer regardless of any intervening menstrual period.

Re-infection from the candidal content of the intestinal tract may be prevented by the concomitant therapy with oral nystatin (Nystan*).

Similarly, Nystan Cream, Ointment or Powder should be applied to the perineal region if necessary.

Contra-indications, warnings, etc

Contra-indications: There are no known contra-indications to the use of Nystavescent pessaries.

Side-effects: Occasionally some transient irritation and burning have been experienced.

Precautions: In pregnancy care should be taken in using an applicator to prevent the possibility of mechanical trauma.

Pharmaceutical precautions *Storage:* In a cool dry place.

Legal category POM.

Package quantities 15 Pessaries in foil strip with applicator. 100 Pessaries in foil strip with 6 applicators.

Further information Nil.

Product licence number 0034/0111.

OPHTHAINE* SOLUTION

Presentation Sterile, aqueous ophthalmic solution containing:

Proxymetacaine hydrochloride	0.5%
Chlorbutol	0.2%
Benzalkonium chloride	0.01%

Uses Actions: Proxymetacaine hydrochloride is a rapidly acting local anaesthetic. With a single drop the onset of anaesthesia occurs in an average of 13 seconds and will persist for an average of 15 minutes.

Indications: Topical anaesthesia in ophthalmic practice.

Dosage and administration *Adults and children:* Administered by topical instillation into the eye. The recommended doses are as follows:

Deep anaesthesia: Instil 1 drop every five to ten minutes for 5–7 doses.

Removal of sutures: Instil 1 or 2 drops two or three minutes before removal of stitches.

Removal of foreign bodies: Instil 1 or 2 drops prior to operating.

Tonometry: Instil 1 or 2 drops immediately before measurement.

Contra-indications, warnings, etc

Contra-indications: There are no known contra-indications with Ophthaine Solution.

Precautions: Ophthaine Solution is not miscible with fluorescein. However, the eye can be anaesthetised with Ophthaine Solution before fluorescein is administered. Regular and prolonged use of a topical ocular anaesthetic, e.g. in conjunction with contact lens insertion, may cause softening and erosion of the corneal epithelium which could produce corneal opacification with accompanying loss of vision.

Side-effects: Pupillary dilatation or cycloplegic effects have rarely been observed with Ophthaine Solution. Irritation of the conjunctiva or other toxic reactions attributable to the preparation have occurred only rarely.

Pharmaceutical precautions *Storage:* In a refrigerator. Discard any solution which is discoloured. The product should not be used one month after first opening the container.

Legal category POM.

Package quantities Bottles of 15 ml.

Further information Nil.

Product licence number 0034/5064.

PRONESTYL* TABLETS AND SOLUTION FOR INJECTION

Presentation *Tablets:* White, engraved Squibb at 754 on one side and scored on reverse, containing 250 mg procainamide hydrochloride.

Solution for Injection: A sterile, aqueous solution containing 100 mg/ml procainamide hydrochloride.

Uses Actions: Procainamide depresses the excitability of cardiac muscle to electrical stimulation and slows conduction in the atrium, the bundle of His and the ventricle, thereby reversing rhythmical abnormalities. In atrial arrhythmias procainamide slows atrial rate and may re-establish normal sinus rhythm.

The action of procainamide begins almost immediately after intramuscular or intravenous administration. Following oral administration, plasma levels are comparable to those obtained parenterally and therapeutic levels are usually obtained in 30 minutes.

Procainamide is less readily hydrolysed than procaine and plasma levels decline slowly – about 10–20% per hour.

The effects of Pronestyl are more beneficial in ventricular than in supraventricular, auricular and nodal arrhythmias.

Indications: Ventricular tachycardia, ventricular ectopic contractions, ventricular fibrillation, supraventricular auricular and nodal tachycardia. In the arrhythmias resulting from anaesthesia and cardiac surgery.

Dosage and administration *Adults – injection:* In most cases 25–50 mg per minute may be given intravenously under ECG control up to a total of 1 g. Where G control is not available 250 mg may be given ramucularly supplemented by oral dosage. In less severe cases and in maintenance therapy a dose of 100–200 mg may be given by intramuscular injection every 4 to 6 hours.

Oral: If used in conjunction with electrical defibrillation Pronestyl 250 mg every six hours will prevent recurrence in the majority of cases.

Following intravenous therapy or for less urgent cases 100 mg by mouth every four to six hours is an alternative route to parenteral administration.

Oral administration of Pronestyl is preferable. When parenteral therapy is necessary the intramuscular route of administration is the method of choice, the intravenous route being limited to emergencies and cases under ECG control.

Plasma concentrations correlate well with therapeutic and toxic effects: consequently plasma level assays could be carried out if facilities are available. The usual effective anti-arrhythmic concentration is 0.4–0.8 mg/100 ml. Toxic manifestations are rare in concentrations less than 1.2 mg/100 ml.

Pronestyl is not recommended for use in children.

Contra-indications, warnings, etc

Contra-indications: Hypersensitivity to the drug is an absolute contra-indication. In this connection, cross sensitivity to procaine and related drugs must be borne in mind. Pronestyl is contra-indicated in patients with myasthenia gravis.

Procainamide should not be administered to patients with complete atrioventricular heart block. Procainamide is also contra-indicated in cases of high degree A-V block unless an electrical pacemaker is operative.

Precautions: Hypotension may occur when Pronestyl is administered intravenously and it should not be given to unconscious patients at a rate greater than 50 mg per minute up to a total of 1 g. Therefore, to initiate therapy, the intravenous dose should be diluted in 5% dextrose solution and BP prior to administration to facilitate control of dosage rate. Patients should be kept in a supine position and blood pressure readings made frequently. If hypotension occurs the rate of injection should be reduced and if necessary a vasopressor agent administered cautiously. ECG tracings should be made during an injection of Pronestyl so that administration may be stopped when the arrhythmia is interrupted or if evidence of extensive depression of conduction appears.

In patients with significant impairment of renal or hepatic function, accumulation of Pronestyl may occur, leading to drug toxicity.

Side-effects: Nausea, vomiting, diarrhoea, dizziness, headache, pruritis, chills, fever and allergic reactions are usually not sufficiently severe to discontinue treatment.

Agranulocytosis and a LE-like syndrome have been reported after prolonged courses of Pronestyl. The LE-like syndrome seldom appears in less than two months, but is very common after six months. It is virtually completely reversible and tests for antinuclear factors remain usually positive before clinical signs appear. If long-term treatment is considered desirable, it is advisable to undertake serological tests at no less than monthly intervals and to continue treatment for no longer than absolutely necessary.

Hypotension may occur particularly in conscious patients (see 'Precautions').

Overdosage: Severe hypotension may be treated by placing the patient in the supine position with the feet raised. If necessary an intravenous infusion of noradrenaline acid tartrate 8 mcg per ml in Sodium Chloride Injection BP may be started.

Pharmaceutical precautions *Storage:* Tablets/
Solution: At room temperature.

Legal category POM.

Package quantities *Tablets:* Bottles of 100.
Solution 100 mg/ml: 10 ml multidose vials.

Further information Nil.

RAUDIXIN* TABLETS

Presentation *Tablets:* Orange, sugar-coated, printed Squibb and 713 in white, containing 50 mg *Rauwolfia serpentina* whole root.

Uses *Actions:* *Rauwolfia serpentina* is antihypertensive, tranquillising and bradycardic. The antihypertensive activity develops slowly over one to three weeks and may persist for a week after drug withdrawal.

Rauwolfia serpentina probably produces its antihypertensive effects through depletion of catecholamines from peripheral sites. In contrast, the sedative and tranquillising effects are thought to relate to brain 5-hydroxytryptamine depletion. It does not significantly affect normal blood pressure.

A complementary action is produced when combined with diuretics or other antihypertensive agents. Combined with other antihypertensive agents such as methyldopa or guanethidine, it permits a lower dosage of these to be given with a consequent reduction in their side-effects.

Indications: Raudixin is indicated in mild to moderate hypertension.

Dosage and administration *Adults:* Initially 4 tablets given daily in divided doses, morning and evening.

Maintenance therapy may vary from 1 to 6 tablets daily given as a single dose or as two divided doses.

Raudixin is not recommended for children.

Contra-indications, warnings, etc

Contra-indications: There are no known contra-indications.

Precautions: Patients with a past history of depression, suicidal tendencies, peptic ulcer or ulcerative colitis. Patients exhibiting signs of depression should be placed on a lower dosage or the drug should be discontinued. It should be administered with caution to patients with Parkinson's disease. *Rauwolfia* preparations cross the placental barrier and appear in cord-blood and breast milk. The safety of *Rauwolfia* in pregnancy has not been established.

Side-effects: Infrequent and mild in nature, which may be controlled by modifying dosage. These include nasal congestion, minor gastrointestinal disturbances, mild sedation and increased dreaming.

Overdosage: If conscious, emesis should be induced or the stomach emptied by aspiration or lavage. Atropine sulphate may be used to relieve para-symphathomimetic side-effects. Signs of motor dysfunction may be treated with benzhexol or other anti-Parkinsonian agents. Severe hypotension may respond to placing the patient in the supine position with the feet raised. Transfusion of plasma or suitable electrolyte solutions may be given slowly if necessary.

Pharmaceutical precautions *Storage:* At room temperature.

Legal category POM.

Package quantities Bottles of 100.

Further information Nil.

Product licence number 0034/5070.

RAUTRAX* TABLETS

Presentation Red, oblong, sugar-coated capsule-shaped, printed Squibb and 766 in black, containing *Rauwolfia serpentina* whole root 50 mg, hydroflumethiazide 50 mg and potassium chloride 625 mg.

Uses *Actions:* *Rauwolfia serpentina* is antihypertensive, tranquillising and bradycardic. The antihypertensive activity develops slowly over one to three weeks and may persist for a week after drug withdrawal. *Rauwolfia serpentina* probably produces its antihypertensive effects through depletion of the catecholamines from peripheral sites. In contrast, the sedative and tranquillising effects are thought to relate to brain 5-hydroxytryptamine depletion. It does not significantly affect normal blood pressure.

Hydroflumethiazide provides smooth reduction of elevated blood pressure but, where normal, has no appreciable effect.

Supplementary potassium provides protection against possible potassium depletion during long-term therapy.

When Rautrax is used in combination with other antihypertensives such as methyl dopa or guanethidine, it permits a lower dosage of these to be given, resulting in a reduction of the side-effects associated with these agents.

Indications: Mild to moderate hypertension.

Dosage and administration *Adults:* Initially 1-3 tablets preferably in divided doses morning and afternoon. After a period of two to three weeks a maintenance dose of as little as 1 tablet daily may suffice.

When used in combination with other antihypertensive agents it is recommended that the dosage of these should be reduced by at least one half.

Rautrax is not recommended for children.

Contra-indications, warnings, etc

Contra-indications: Severe renal failure.

Precautions: Any preparation containing *Rauwolfia* should be used with caution in patients with a history of depression, suicidal tendencies, peptic ulcer or ulcerative colitis, also in patients with Parkinson's disease. Care should be taken in treating patients with severely damaged kidneys and low urinary output. *Rauwolfia* preparations cross the placental barrier and appear in cord-blood and breast milk. The safety of *Rauwolfia* in pregnancy has not been established.

Side-effects: Infrequent and mild in nature, which may be controlled by modifying dosage. These include nasal congestion, minor gastro-intestinal disturbances, mild sedation and increased dreaming.

Warning: Symptoms and signs which might indicate ulceration or obstruction of the small bowel in patients taking tablets or capsules containing potassium salts; indications for stopping treatment immediately. The chance of this occurring with Rautrax is slight since the formulation is not enteric-coated.

Overdosage: If conscious, emesis should be induced the stomach emptied by aspiration or lavage. Atropine sulphate may be used to relieve parasympathomimetic side-effects. Signs of motor dysfunction may be treated with benzhexol or other anti-Parkinsonian agents. Severe hypotension may respond to placing the patient in the supine position with feet raised. Transfusions of plasma or suitable electrolyte solutions may be given slowly if necessary.

Pharmaceutical precautions *Storage:* At room temperature.

Legal category POM.

Package quantities Bottles of 100 and 500.

Further information Nil.

Product licence number 0034/5072.

REMIDERM* CREAM AND OINTMENT

Presentation *Cream:* white to pale buff vanishing cream containing triamcinolone acetonide 0.025% and halquinol 0.75%.

Ointment: white to pale buff, containing triamcinolone acetonide 0.025% and halquinol 0.75% in Plastibase*.

Uses *Actions:* Triamcinolone acetonide is a potent fluorinated corticosteroid with rapid anti-inflammatory antipruritic and anti-allergic actions.

Halquinol has a wide range of antimicrobial activity in contrast to the antibiotics, it is effective against most bacterial and fungal pathogens commonly found on the skin, also against antibiotic-resistant bacteria.

Indications: Inflammatory skin disorders, especially those complicated or threatened by secondary bacterial infection and/or fungal infection, including: atopic eczema, contact eczema, follicular eczema, infantile eczema, anogenital pruritus (pruritus ani et vulvae), nummular eczema, post-traumatic infective eczema, seborrhoeic or flexural eczema, neuro-dermatitis, psoriasis, otitis externa.

Dosage and administration *Adults and children:* To be applied two to four times daily.

Contra-indications, warnings, etc

Contra-indications: In tuberculous and most viral lesions of the skin, particularly herpes simplex, vaccinia or varicella.

Precautions: Care should be taken when applying Remiderm near the eyes. In infants long-term continuous topical corticosteroid therapy should be avoided. Adrenal suppression can occur, even without occlusion. Topical administration of corticosteroids to pregnant animals can cause abnormalities of foetal development. The relevance of this finding to humans has not been established. However, topical steroids should not be used extensively in pregnancy, i.e. in large amounts or for long periods.

Side-effects: In acute weeping skin conditions transient stinging may be experienced. Sensitivity reactions to halquinol may occur.

Pharmaceutical precautions *Storage:* Cream: At room temperature; avoid freezing.

Intment: At room temperature.

Ilution: Not recommended. If dilution is necessary, the manufacturer should be consulted for advice. Halquinol incompatible with iron and certain other metals.

Legal category POM.

Package quantities Tubes of 15 g and 30 g.

Further information *Note:* Remiderm may cause slight staining on some clothing materials. Stains should disappear in laundering. Care should be taken to avoid contact with vinyl/plastic surfaces as these stains may be particularly resistant.

Product licence numbers

REMIDERM* SPRAY

Presentation Aerosol preparation containing in each gram: 0.07 mg triamcinolone acetonide and 0.42 mg halquinol in a vehicle with propellant.

Uses *Actions:* Triamcinolone acetonide is a potent urinated corticosteroid with rapid anti-allergic actions. Halquinol has a wide range of antimicrobial activity; in contrast to the antibiotics, it is effective against most bacterial and fungal pathogens commonly found on the skin, also against antibiotic-resistant bacteria.

Indications: Inflammatory skin disorders, especially those complicated or threatened by secondary bacterial infection and/or fungal infection, including: atopic eczema, contact eczema, follicular eczema, infantile eczema, anogenital pruritis (pruritis ani et vulvae), nummular eczema, post-traumatic infective eczema, seborrhoeic or flexural eczema, neuro-dermatitis, psoriasis, otitis externa.

Dosage and administration *Adults and children:* To be applied two to four times daily.

Contra-indications, warnings, etc

Contra-indications: In tuberculous and most viral lesions of the skin, particularly herpes simplex, vaccinia and varicella.

Precautions: Care should be taken when applying Remiderm near the eyes. In infants, long-term continuous topical corticosteroid therapy should be avoided. Adrenal suppression can occur, even without occlusion. Topical administration of corticosteroids to pregnant animals can cause abnormalities of foetal development. The relevance of this finding to humans has not been established. However, topical steroids should not be used extensively in pregnancy, i.e. in large amounts or for long periods.

Side-effects: In acute weeping skin conditions transient stinging may be experienced. Sensitivity reactions to halquinol may occur.

Pharmaceutical precautions *Storage:* At room temperature. Normal aerosol precautions should be observed.

Legal category POM.

Package quantities 50 g aerosol cans.

Further information *Note:* Remiderm may cause slight staining on some clothing materials. Stains should disappear in laundering. Care should be taken to avoid contact with vinyl/plastic surfaces as these stains may be particularly resistant.

Product licence number 0034/5078.

REMOTIC* EAR DROP CAPSULES

Presentation Each 0.3 ml opaque, yellow, nozzle soft gelatin capsule contains:

Triamcinolone acetonide	0.025%
Halquinol	0.75%

Uses *Actions:* Triamcinolone acetonide is a potent, fluorinated corticosteroid with rapid anti-inflammatory, antipruritic and anti-allergic actions.

Halquinol has a wide range of antimicrobial activity; in contrast to the antibiotics, it is effective against most bacterial and fungal pathogens commonly found on the skin, also against antibiotic-resistant bacteria.

Indications: For the treatment of inflammatory and infective conditions of the auditory meatus, including: otitis externa, chronic and acute otomycosis, otorrhoea, chronic suppurative otitis media, infected fenestration cavities, infected mastoid cavities.

†As an adjunct to systemic chemotherapy or other measures as indicated.

Dosage and administration *Adults and children:* The contents of 1 capsule should be squeezed into the ear two or three times daily.

Contra-indications, warnings, etc

Contra-indications: Tuberculous or viral skin disorders.

Precautions: Topical administration of corticosteroids to pregnant animals can cause abnormalities of foetal development. The relevance of this finding to humans has not been established. However, topical steroids should not be used extensively in pregnancy i.e. in large amounts or for long periods. Not to be used near the eyes.

Side-effects: Transient stinging may occur in acute weeping lesions. Sensitivity reactions to halquinol may occur.

Pharmaceutical precautions *Storage:* In a cool place; avoid freezing.

Legal category POM.

Package quantities 15 capsules in foil strip.

Further information *Note:* Remotic may cause staining on some clothing materials. Stains should disappear in laundering. Care should be taken to avoid contact with vinyl/plastic surfaces as these stains may be particularly resistant.

Product licence number 0034/5079.

TRI-ADCORTYL* CREAM, OINTMENT AND OTIC OINTMENT

Presentation *Cream:* Pale buff.

Ointment: Yellow to amber.

Otic Ointment: Presentation for aural use.

Containing in each gram the following:

Triamcinolone acetoneide	0.1%
Neomycin (as sulphate)	0.25%
Gramicidin	0.025%
Nystatin	100,000 units

Uses Actions: Triamcinolone acetoneide is a potent fluorinated corticosteroid with rapid anti-inflammatory, antipruritic and anti-allergic actions.

The combined action of the antibiotics neomycin and gramicidin provides comprehensive antibacterial therapy against a wide range of Gram-positive and Gram-negative bacteria, including those micro-organisms responsible for most bacterial skin infections.

Nystatin is an antifungal antibiotic, active against a wide range of yeasts and yeast-like fungi, including *Candida albicans*.

Indications: The topical treatment of superficial bacterial infections, cutaneous candidosis and dermatological conditions known to respond to topical steroid therapy when threatened or complicated by bacterial or candidal superinfections. These include: atopic eczema, contact eczema, follicular eczema, infantile eczema, otitis externa, anogenital pruritus (pruritus ani et vulvae), nummular eczema, post-traumatic infective eczema, seborrhoeic or flexural eczema, neurodermatitis, psoriasis.

Dosage and administration Adults and children: *Cream, ointment:* Apply to the affected areas two to four times daily.

Otic Ointment: After cleaning, apply the nozzle to the aural canal and squeeze a small amount into the canal two to four times daily.

Contra-indications, warnings, etc

Contra-indications: In tuberculous and most viral lesions of the skin, particularly herpes simplex, vaccinia and varicella. Also in fungal lesions not susceptible to nystatin.

Precautions: Since the use of occlusive dressings may increase the risk of sensitivity, such dressings should be avoided. In infants, long-term continuous topical steroid therapy should be avoided. Adrenal suppression may occur, even without occlusion.

Topical administration of corticosteroids to pregnant animals can cause abnormalities of foetal development. The relevance of this finding to humans has not been established. However topical steroids should not be used extensively in pregnancy, i.e. in large amounts or for long periods.

Otic Ointment: Care is necessary in applying this preparation if perforation of the eardrum is suspected.

Not for ophthalmic use.

Side-effects: Sensitivity reactions to neomycin may occur; gramicidin sensitivity has occasionally been reported.

Pharmaceutical precautions Storage: *Cream:* At room temperature; avoid freezing.

Ointment: At room temperature.

Dilution: Not recommended, as this would reduce the concentration of the antibiotics to below therapeutic levels.

Legal category POM.

Package quantities Tubes of 15 g and 30 g.

Otic Ointment: Tubes of 10 g.

Further information Tri-Adcortyl Ointment is preservative-free, and avoids the risk of allergic reactions to preservatives.

Product licence numbers

Tri-Adcortyl Ointment	0034/5094
Tri-Adcortyl Otic Ointment	0034/5095

TRICADERM* SOLUTION

Presentation Colourless alcoholic solution containing:

Triamcinolone acetoneide	0.2%
Salicylic acid	2.0%
Benzalkonium chloride	0.05%

Uses Actions: Triamcinolone acetoneide is a potent fluorinated corticosteroid with rapid anti-inflammatory antipruritic and anti-allergic actions.

Salicylic acid has bacteriostatic and fungicidal properties, it is also keratolytic.

Benzalkonium chloride is bactericidal in low concentration against a wide range of Gram-positive and Gram-negative bacteria.

Indications: Tricaderm Solution is indicated for steroid-responsive dermatoses of the scalp such as seborrhoea psoriasis, circumscribed chronic dermatoses and alopecia areata. Also chronic discoid lupus erythematosus and mycoses fungoides of the face.

Dosage and administration Adults: To be applied each evening before the patient retires. The solution should be applied drop by drop to cover the affected area. If a standard or occlusive dressing is to be used, it should be removed in the morning. As improvement occurs treatment need be repeated only every second or third night. Therapy should continue for not more than four weeks.

Tricaderm Solution is not recommended for children.

Contra-indications, warnings, etc

Contra-indications: Tuberculous and most viral lesions of the skin, particularly herpes simplex, vaccinia and varicella.

Systemic absorption could occur if occlusive dressings are used for an extensive area of the scalp.

Precautions: On acute lesions, transient stinging may be experienced. Caution should be exercised in dermatoses of the scalp where deep seated infections are suspected. Topical administration of corticosteroids to pregnant animals can cause abnormalities of foetal development. The relevance of this finding to human beings has not been established; however, topical steroids should not be used extensively in pregnancy, i.e. in large amounts or for prolonged periods. Tricaderm Solution must be kept away from the eyes. It is inflammable and, on scalp application, hair should not be dried in front of an open fire.

Side-effects: Tricaderm Solution is well tolerated. Local intolerance due to triamcinolone acetoneide or benzalkonium chloride is rare; however, salicylic acid may be mildly irritating.

Pharmaceutical precautions Storage: In a cool place.

Dilution: Not to be diluted.

Legal category POM.

Package quantities Bottles of 25 ml.

Further information Nil.

Product licence number 0034/5096.

'ELOSEF' CAPSULES 'ELOSEF' SYRUP

Presentation *Capsules* 250 mg: Opaque, orange body with opaque blue cap printed Squibb and 113 in white on each half. Each capsule contains 250 mg cephadrine.

Capsules 500 mg: Opaque blue printed in white with Squibb and 114 on each half. Each capsule contains 500 mg cephadrine.

Syrup 125 mg: When reconstituted contains 125 mg cephadrine per 5 ml.

Syrup 250 mg: When reconstituted contains 250 mg cephadrine per 5 ml.

Uses *Actions:* Cephadrine is a broad-spectrum, bactericidal antibiotic active against both Gram-positive and Gram-negative bacteria. It is also highly active against most strains of penicillinase-producing *Staphylococci*.

Microbiology: The following organisms have shown *in vitro* sensitivity to cephadrine:

Gram-positive – *Staphylococci* (both penicillin sensitive and resistant strains), *Streptococci*, both *Streptococcus pyogenes* (beta haemolytic) and Group D *Streptococcus* (enterococci) and *Diplococcus pneumoniae*.

Gram-negative – *E. coli*, *Klebsiella* and *Enterobacter* spp., *Proteus mirabilis* and other indole-negative *Proteus* spp., *Haemophilus influenzae*, *Shigella*, *Salmonella* and *Veissaria* spp.

Because cephadrine is unaffected by penicillinase, many strains of *E. coli* and *Staphylococcus aureus* which produce this enzyme are susceptible to cephadrine but resistant to ampicillin.

Indications: In the treatment of infections of the urinary, respiratory and gastro-intestinal tracts and of the skin and soft tissues. These include:

Upper respiratory infections – pharyngitis, sinusitis, otitis media, tonsillitis.

Lower respiratory infections – acute and chronic bronchitis, pneumonia.

Urinary tract infections – cystitis, urethritis, pyelonephritis.

Skin and soft tissue infections – abscess, cellulitis, furunculosis.

Gastro-intestinal tract – bacillary dysentery, enteritis.

Cephadrine has been shown to be effective in reducing the incidence of postoperative infections in patients undergoing surgical procedures associated with a high risk of infection. It is also of value where postoperative infections would be disastrous and where patients have a reduced host resistance to bacterial infection. Protection is best ensured by achieving adequate local tissue concentrations at the time contamination is likely to occur. Thus, cephadrine should be administered immediately prior to surgery and continued during the postoperative period.

Bacteriology studies to determine the causative organisms and their sensitivity to cephadrine should be performed. Therapy may be instituted prior to receiving the results of the sensitivity test.

Dosage and administration *Adults:* For urinary tract infections the usual dose is 500 mg four times daily or 1 g twice daily; severe or chronic infections may require

larger doses. Prolonged intensive therapy is needed for complications such as prostatitis and epididymitis. For respiratory tract infections and skin and soft tissue infections the usual dose is 250 mg or 500 mg four times daily or 500 mg or 1 g twice daily depending on the severity and site of infections. For gastro-intestinal tract infections, 500 mg three or four times daily may be employed.

Children: The usual dose is from 25 to 50 mg/kg/day total, given in two or four equally divided doses. For severe or chronic infections the dosage may be doubled, but the maximum dose should not exceed 4 g per day.

All patients, irrespective of age and weight: Larger doses (up to 1 g four times daily) may be given for severe or chronic infections. Therapy should be continued for a minimum of 48-72 hours after the patient becomes asymptomatic or evidence of bacterial eradication has been obtained. In infections caused by haemolytic strains of streptococci, a minimum of 10 days treatment is recommended to guard against the risk of rheumatic fever or glomerulonephritis.

Contra-indications, warnings, etc

Contra-indications: Patients with known hypersensitivity to the cephalosporin antibiotics.

Precautions: There is evidence of partial cross-allergenicity between the penicillins and the cephalosporins. Therefore cephadrine should be used with caution in those patients with known hypersensitivity to penicillins.

Patients with known or suspected renal impairment should receive careful clinical observation and appropriate laboratory studies since cephadrine may accumulate in the serum and tissues unless dosage is suitably reduced.

Although animal studies have not demonstrated any teratogenicity, as with all drugs caution should be exercised in pregnancy.

Cephadrine is excreted in breast milk and should be used with caution in lactating mothers.

After treatment with cephadrine, a false positive reaction for glucose in the urine may occur with Benedict's or Fehling's solution or with reagent tablets such as Clinistix[®], but not with enzyme-based tests such as Clinistix[®] or Diastix[®].

As with all antibiotics, prolonged use may result in overgrowth of non-susceptible organisms.

Pseudomonads are uniformly resistant to the cephalosporin class of antibiotics.

Side-effects: Limited essentially to gastro-intestinal disturbances and on occasion to hypersensitivity pneumonia. The latter are more likely to occur in individuals who have previously demonstrated hypersensitivity and those with a history of allergy, asthma, hay fever or urticaria. The majority of reported side-effects have been mild. Skin reactions have occasionally been reported.

Adverse reaction reports are rare, but include glossitis, heartburn, nausea, vomiting and diarrhoea. Hypersensitivity reactions include urticaria, skin rashes and joint pains.

As with other oral cephalosporins, mild transient eosinophilia and rarely positive direct Coombs tests have been reported.

Pharmaceutical precautions *Storage: Capsules:* In a cool place.

Powder for syrup: A cool place. After reconstitution; discard unused syrup after 14 days if stored in refrigerator, or seven days at room temperature.

Dilution: Velosef Syrup may be diluted with Syrup BP. The diluted syrup should be used within seven days.

Legal category POM.

Package quantities *Capsules:* Boxes of 20 in foil and bottles of 100.

Syrup: Bottles of 100 ml.

Further information Cephadrine has a high degree of stability to many beta-lactamases. It has a low degree of protein-binding and a large volume of distribution. Therefore, tissue levels are generally found to be high. Oral cephradine can be given twice or four times daily, and is well absorbed.

VELOSEF* FOR INJECTION

Presentation Velosef for Injection is a sterile powder blend of cephradine and L-arginine. After reconstitution, Velosef for Injection 500 mg, 1.0 g and 2.0 g vials provide 500 mg, 1.0 g and 2.0 g of cephradine activity, respectively.

Uses *Actions:* Cephradine is a broad-spectrum bactericidal antibiotic active against both Gram-positive and Gram-negative bacteria. It is also highly active against most strains of penicillinase-producing staphylococci.

Microbiology: The following organisms have shown in vitro sensitivity to cephradine:

Gram-positive – *Staphylococci* (both penicillin sensitive and resistant strains), *Streptococci*, both *Streptococcus pyogenes* (beta haemolytic) and Group D *Streptococci* (enterococci) and *Diplococcus pneumoniae*.

Gram-negative – *E. coli*, *Klebsiella* and *Enterobacter* spp.; *P. mirabilis* and other indole-negative *Proteus* spp., *Haemophilus influenzae*, *Shigella* spp., *Salmonella* spp. (including *Salmonella typhi*) and *Neisseria* spp.

Because cephradine is unaffected by penicillinase, many strains of *E. coli* and *Staphylococcus aureus* which produce this enzyme are susceptible to cephradine but resistant to ampicillin.

Indications: The treatment of infections of the urinary, respiratory and gastro-intestinal tracts and of the skin and soft tissues, bones and joints; also septicaemia and endocarditis. These include:

Upper respiratory infections – pharyngitis, sinusitis, otitis media, tonsillitis, laryngo-tracheo-bronchitis.

Lower respiratory infections – acute and chronic bronchitis, lobar and bronchopneumonia.

Urinary tract infections – cystitis, pyelonephritis.

Skin and soft tissue infections – abscess, cellulitis, furunculosis, impetigo.

Gastro-intestinal tract – bacillary dysentery, enteritis, peritonitis.

Cephradine has been shown to be effective in reducing the incidence of postoperative infections in patients undergoing surgical procedures associated with a high risk of infection. It is also of value where post-operative infection would be disastrous and where patients have a reduced host resistance to bacterial infection. Protection is best ensured by achieving adequate local tissue concentrations at the time contamination is likely to

occur. Thus, cephradine should be administered immediately prior to surgery and continued during the postoperative period.

Bacteriological studies to determine the causative organisms and their sensitivity to cephradine should be performed. Therapy may be instituted prior to receiving the results of the sensitivity test.

Sterile cephradine for injection is indicated primarily for those patients unable to tolerate oral medication. It is also indicated for intravenous use either by direct injection or by intravenous infusion for the treatment of serious and life-threatening infections.

Dosage and administration Intramuscular or intravenous injection and intravenous infusion.

Adults: The usual dose range of cephradine for injection is 2-4 g daily in four equally divided doses. This may be increased up to 8 g a day for severe infections, e.g. septicaemia and endocarditis. For the majority of infections, the usual dose is 500 mg q.i.d. in equally spaced doses; severe or chronic infections may require large doses. Prolonged intensive therapy is needed for complications such as prostatitis and epididymitis. Patients who are severely ill and who require high serum levels of cephradine for treating their infections should be started on intravenous therapy.

Limited experience indicates that intraperitoneal administration of cephradine may be effective after surgery in cases of peritonitis where a surgical drainage system has been established.

Children: The usual dose is 50-100 mg/kg/day total given in four equally divided doses. More serious illnesses (e.g. typhoid fever) may require 200-300 mg/kg/day.

All patients, regardless of age and weight: Therapy should be continued for a minimum of 48-72 hours after the patient becomes asymptomatic or evidence of bacterial eradication has been obtained. In infections caused by haemolytic strains of streptococci, a minimum of 10 days of treatment is recommended to guard against the risk of rheumatic fever or glomerulonephritis. In the treatment of chronic urinary tract infections, frequent bacteriological and clinical appraisal is necessary during therapy and may be necessary for several months afterwards. Persistent infections may require treatment for several weeks. Smaller doses than those indicated above should not be used. Doses for children should not exceed doses recommended for adults. As cephradine is available in both injectable and oral form, patients may be changed from cephradine injectable to cephradine oral at the same dosage level.

Reconstitution: For intramuscular use: Aseptically add sterile water for injection or 0.9% sodium chloride injection according to the following table:

Single dose* vial size	Volume of diluent to be added
500 mg	2.0 ml
1 g	4.0 ml
2 g	8.0 ml

* Preparation contains no bactericide and is not intended for multiple dose use.

Shake to effect solution and withdraw the entire contents. Intramuscular solutions should be used within 2 hours at room temperature; when stored in a refrigerator at 5°C, solutions retain full potency for 12 hours. Reconstituted solutions may vary in colour from light to straw yellow; however, this does not affect the potency.

or intravenous use: Cephadrine for injection may be administered by direct intravenous injection or by infusion. A 3 mcg/ml serum concentration can be maintained for each milligram of cephadrine per kg body weight per hour of infusion.

or direct intravenous administration: Suitable intravenous injection solutions are Sterile Water for Injection, 5% Dextrose Injection or 0.9% Sodium Chloride Injection.

Aseptically add 5 ml of diluent to the 500 mg vial, 10 ml to the 1 g vial or 20 ml to the 2 g vial. Shake to effect solution and withdraw the entire contents. The solution may be slowly injected directly into a vein over 3 to 5 minute period. The solution should be used within 2 hours when kept at room temperature; if stored at 5°C, solutions retain full potency for 12 hours.

or continuous or intermittent intravenous infusion: Suitable intravenous infusion solutions are Sterile Water for Injection (50 mg/ml cephadrine solutions are approximately isotonic); 5% or 10% Dextrose Injection, 0.9% Sodium Chloride Injection, Sodium Lactate Injection (M/6 sodium lactate); Dextrose and Sodium Chloride Injection; Lactated Ringer's Injection; Ringer's Injection; 5% Dextrose in Lactated Ringer's Injection; 5% Dextrose in Ringer's Injection.

V.B. Only cephadrine solubilised with arginine may be reconstituted with solutions containing calcium salts, such as Ringer's Solutions.

For further information on compatibilities consult the manufacturer.

Contra-indications, warnings, etc

Contra-indications: Patients with known hypersensitivity to the cephalosporin antibiotics.

Precautions: There is evidence of partial cross-allergenicity between the penicillins and the cephalosporins. Therefore cephadrine should be used with caution in those patients with known hypersensitivity to penicillins.

Patients with known or suspected renal impairment should receive careful clinical observation and appropriate laboratory studies, since cephadrine may accumulate in the serum and tissues unless the dosage is suitably reduced.

Although animal studies have not demonstrated any teratogenicity, safety in pregnancy has not been established.

Cephadrine is excreted in breast milk and should be used with caution in lactating mothers.

After treatment with cephadrine a false positive reaction for glucose in the urine may occur with Benedict's solution or Fehling's solution or with reagent tablets such as Clinistix*, but not with enzyme-based tests such as Clinistix* or Diastix*.

As with all antibiotics, prolonged use may result in overgrowth of non-susceptible organisms.

Pseudomonas are uniformly resistant to the cephalosporin class of antibiotics.

Side-effects: As with other cephalosporins untoward reactions will be limited essentially to gastro-intestinal disturbances and on occasion to hypersensitivity phenomena. The latter are more likely to occur in individuals who have previously demonstrated hypersensitivity and those with a history of allergy, asthma, hay fever or urticaria.

The majority of reported side-effects have been mild. Skin reactions have occasionally been reported.

Adverse reaction reports are rare but include glossitis, heartburn, nausea, vomiting and diarrhoea. Skin and

hypersensitivity reactions include urticaria, skin rashes and joint pains.

Although slight and transient elevations of BUN have been encountered, the serum creatinine measured in half the patients proved to be within normal limits, suggesting an extrarenal cause for the elevated readings.

As with other oral cephalosporins, mild transient eosinophilia and rarely positive direct Coombs tests have been reported.

Scattered and transient elevations in LDH's, serum transaminases and other liver function tests show no pattern suggestive of hepatic involvement but are more likely to be due to minor tissue damage at the site of injection, as has been reported with other injectable drugs.

As with other parenterally administered antibiotics, transient pain may be experienced at the injection site, but is seldom the cause for discontinuing treatment. Thrombophlebitis has been reported following intravenous injection.

No tooth pigmentation, photosensitivity or major blood dyscrasias have been reported.

Pharmaceutical precautions *Storage (before reconstitution):* At room temperature.

Legal category POM.

VERDIVITON* ELIXIR

Presentation Clear, green liquid containing in each 15 ml:

Thiamine mononitrate (vitamin B ₁)	2 mg
Riboflavin (vitamin B ₂)	1 mg
Pyridoxine hydrochloride (vitamin B ₆)	0.5 mg
Nicotinamide	15 mg
d-Panthenol	1 mg
Cyanocobalamin (vitamin B ₁₂)	15 mcg
Calcium glycerophosphate	110 mg
Sodium glycerophosphate	80 mg
Potassium glycerophosphate	20 mg
Manganese glycerophosphate	10 mg
Alcohol	17% by volume

Uses *Indications:* The maintenance of adequate levels of B vitamins particularly in those conditions where such levels may be thought to be lowered.

Dosage and administration *Adults:* Three 5 ml spoonfuls three times daily.

Children up to 12 years of age: One or two 5 ml spoonfuls in water three times daily.

Verdiviton should preferably be taken before meals.

Contra-indications, warnings, etc

Contra-indications: Where the use of alcohol is undesirable, hepatitis and alcoholism.

Hatfield, Herts AL10 0NZ

ALPHOSYL*

Representation *Lotion and Cream*: Containing allantoin 5% refined alcoholic extract of coal tar 5% in a greaseless vanishing-cream base.

Application PC: Refined alcoholic extract of coal tar 5% allantoin 0.2% in a foaming shampoo base.

The lotion is a light free-flowing emulsion and the cream is smooth and homogeneous, light tan in colour. The application is a light green/tan soft shampoo.

Uses Dermatological stimulant for the treatment of psoriasis, psoriasis of the scalp and dandruff.

Dosage and administration *Lotion and Cream*: Apply liberally two to four times daily, massage gently into the affected areas. Occlusive dressings are unnecessary.

Application PC: Wet scalp and hair, apply shampoo and vigorously massage to lather, rinse and repeat if necessary.

Contra-indications, warnings, etc For external use only. Discontinue if irritation occurs or in cases of sensitivity to coal tar.

Pharmaceutical precautions Do not refrigerate.

Legal category P.

Package quantities *Alphosyl Lotion*: Bottles of 50 ml.

Alphosyl Cream: Tube of 75 g.

Alphosyl Application PC: Tube of 60 g.

Further information Alphosyl Lotion is the basic treatment for psoriasis of the body and scalp.

Alphosyl Cream is designed especially for lubrication of the intertriginous areas.

Alphosyl Application PC is an adjunctive therapy for patients with psoriasis of the scalp, dandruff and other scalp disorders. It prevents irritation of the scalp and is used also in preparation for treatment with the Lotion.

Product licence numbers

Alphosyl Lotion 0036/5008

Alphosyl Cream 0036/5006

Alphosyl Application PC 0036/5005

ALPHOSYL* HC CREAM

Representation A cream containing refined alcoholic extract of coal tar 5% allantoin 2% and hydrocortisone PhEur 0.5% in a greaseless vanishing cream base. The cream is smooth, homogeneous, and is light tan in colour.

Uses Dermatological stimulant and local corticosteroid anti-inflammatory therapy for psoriasis.

Dosage and administration Apply two to four times daily, massaging gently into the affected areas.

Contra-indications, warnings, etc In infants, long-

term continuous therapy should be avoided. Adrenal suppression can occur even without occlusion.

Topical administration of corticosteroids to pregnant animals can cause abnormality of foetal development. The relevance of this finding to human beings has not been established. However, topical steroids should not be used extensively in pregnancy, i.e. in large amounts or for long periods.

Pharmaceutical precautions Store at room temperature.

Legal category POM.

Package quantities Tubes of 30 g and 45 g.

Further information Alphosyl HC Cream is intended for the treatment of the acute stages of psoriasis when the basic Alphosyl action is enhanced by the addition of hydrocortisone.

Product licence number 0036/0026.

COLIFOAM*

Representation White, odourless aerosol foam containing hydrocortisone acetate PhEur 10%. Other ingredients: propylene glycol, ethoxylated stearyl alcohol, polyoxyethylene-10-stearyl ether, cetyl alcohol, methyl and propyl parabens, triethanolamine and water. Inert propellants added.

Uses Anti-inflammatory corticosteroid therapy for the topical treatment of ulcerative colitis, proctosigmoiditis and granular proctitis.

Dosage and administration One applicatorful inserted into the rectum once or twice daily for two or three weeks and every second day thereafter. Shake can vigorously before use (illustrated instructions are enclosed in each pack).

Satisfactory response usually occurs within five to seven days.

Contra-indications, warnings, etc Local contra-indications to the use of intrarectal steroids include obstruction, abscess, perforation, peritonitis, fresh intestinal anastomoses and extensive fistulas.

General precautions common to all corticosteroid therapy should be observed during treatment with Colifoam. Treatment should be administered with caution in patients with severe ulcerative disease because of their predisposition to perforation of the bowel wall.

Safety during pregnancy has not been fully established.

Pharmaceutical precautions Do not refrigerate, incinerate or puncture the aerosol can. Shake vigorously before use. Keep out of reach of children.

Legal category POM.

Package quantities Aerosol canister containing 20 g

(14 applications) plus a plastic applicator and illustrated leaflet.

Further information One applicatorful of Colifoam provides a dose of approximately 90–100 mg of hydrocortisone acetate, similar to that used in a retention enema, for the treatment of ulcerative colitis, sigmoiditis and proctitis.

Product licence number 0036/0021.

EPIFOAM*

Presentation Muco-adherent, white, odourless aerosol foam containing:

Hydrocortisone acetate PhEur 1%

Pramoxine hydrochloride USP XX 1%

Other ingredients: propylene glycol, ethoxylated stearyl alcohol, polyoxyethylene-10-stearyl ether, cetyl alcohol, methyl *p*-hydroxybenzoate, propyl *p*-hydroxybenzoate, triethanolamine, deionised water, in aerosol canisters containing 10 g.

Uses For the treatment of post-episiotomy pain and discomfort. Also for the relief of steroid responsive dermatoses.

Dosage and administration A suitable quantity of foam should be dispensed onto a pad, preferably sterile, and applied to the site or affected areas 3–4 times daily.

Contra-indications, warnings, etc Do not use on infected lesions unless accompanied by appropriate anti-infective agents. Should not be used extensively in pregnancy. Avoid long term therapy in infants.

Pharmaceutical precautions Do not refrigerate, incinerate or puncture the aerosol can.

Shake well before use. Use at room temperature. Keep out of the reach of children.

For external use only.

Legal category POM.

Package quantities Aerosol canister containing 10 g of foam, (will deliver 25 applications of 5 ml).

Further information An illustrated instruction leaflet is enclosed with each pack.

Product licence number 0036/5002.

PHAZYME*

Presentation Pink, sugar-coated, two-phase tablet, each tablet containing:

In the outer layer,

Specially activated simethicone 20 mg

In the core, protected for release in the small intestine,

Pancreatin enzymes USNF XIV

Protease 3,000 NF units

Lipase 240 NF units

Amylase 2,000 NF units

Specially activated simethicone 40 mg

Uses Deflatulent action for the relief of pain and distention due to gastro-intestinal gas. Enzymatic action for the improvement of the digestive processes.

Dosage and administration One or two tablets to be swallowed with meals and upon retiring or as required.

Contra-indications, warnings, etc Specially acti-

vated simethicone is physiologically inert and is not absorbed and therefore has no side-effects or contra-indications.

Likewise the pancreatic enzymes have no side-effects or contra-indications.

Pharmaceutical precautions No special precautions.

Legal category P.

Package quantities Bottles of 100 tablets.

Further information Phazyme Tablets are compatible with any other therapy which may be prescribed concurrently.

Product licence number 0036/0025.

PROCTOFOAM HC*

Presentation Muco-adherent, white, odourless aerosol foam containing:

Hydrocortisone acetate PhEur 1%

Pramoxine hydrochloride USP XX 1%

Other ingredients: propylene glycol, ethoxylated stearyl alcohol, polyoxyethylene-10-stearyl ether, cetyl alcohol, methyl *p*-hydroxybenzoate, propyl *p*-hydroxybenzoate, triethanolamine, deionised water, in aerosol canister containing 20 g, with a plastic applicator.

Uses Anti-inflammatory, antipruritic anaesthetic. For the temporary relief of inflammation, pruritus, pain and swelling associated with haemorrhoids, proctitis, cryptitis, fissures, post-operative pain and pruritus ani. For treatment of post-episiotomy pain and discomfort.

Dosage and administration One applicatorful per rectum two or three times daily and after each bowel evacuation. Perianally or for post-episiotomy use – apply as needed. Not indicated in infants and young children.

Contra-indications, warnings, etc A complete rectal examination to rule out serious pathology should be completed before instituting therapy. Do not use on infected lesions unless accompanied by appropriate anti-infective agents. Discontinue use if sensitivity develops. Steroids should not be used unnecessarily during pregnancy since safety during pregnancy has not been fully established.

Pharmaceutical precautions Do not refrigerate, incinerate or puncture the aerosol can.

Shake well before use. Use at room temperature.

Legal category POM.

Package quantities Aerosol canister containing 20 g of foam (approximately 40 doses), plus a plastic applicator.

Further information One applicatorful of Proctofoam HC provides a dose of approximately 3–5 mg of both hydrocortisone acetate and pramoxine hydrochloride.

An illustrated instruction leaflet is enclosed with each pack.

Product licence number 0036/5002.

QUELLADA*

Presentation *Quellada Lotion*: Gamma benzene hexachloride 1% in a pleasantly perfumed lotion base, pearly white in colour.

Quellada Application PC: Gamma benzene hexachloride 1% in a specially formulated foaming shampoo base. Quellada Application PC is a yellow, clear liquid.

Uses Antiparasitic – ovacidal.

For the treatment of mite and lice infestations, e.g. scabies, head lice, pubic lice and body lice.

Dosage and administration *Lotion (scabies):* After hot bath or shower apply a thin layer to the whole body surface except face and scalp. Leave for 24 hours, then wash thoroughly.

Application PC (pediculosis): For use on the hairy areas of the scalp and body. Apply to wet hair, rub vigorously for four minutes, rinse and comb with a fine tooth comb.

Contra-indications, warnings, etc *Lotion:* External use only. Avoid contact with eyes and other mucous membrane.

Application PC: Avoid contact with the eyes. Should they accidentally get into the eyes immediately flush with water. Do not use more than twice in any one infestation nor in any one week. Do not use on broken or infected skin.

Pharmaceutical precautions Do not refrigerate.

Legal category P.

Package quantities Both Quellada Lotion and Quellada Application PC are available in bottles of 100 ml and 500 ml.

Further information As Gamma benzene hexachloride 1% is effective against both adult and egg stage of the sarcoptes scabiei and pediculus, one application is usually sufficient to clear infestation, provided that instructions are carried out correctly. Printed instructions are issued with each pack.

Irritation and sensitivity are rare.

Product licence numbers

Quellada Lotion 0036/5000
Quellada Application PC 0036/5001

TARCORTIN*

Presentation Hydrocortisone PhEur 0.5% and refined alcoholic extract of coal tar 5% in a vanishing cream base. It is a light tan, homogeneous cream.

Uses Stimulating, antipruritic. For all simple or refractory subacute and chronic skin affections, including chronic eczema, infantile eczema, localised neurodermatitis, seborrhoea, dermatitis venenata, pruritus ani and psoriasis.

Dosage and administration Apply twice daily or more frequently to the affected area by gentle massage until the cream has vanished into the skin. No dressing is needed.

Contra-indications, warnings, etc Contra-indicated in the presence of viral or fungal infections, tubercular or syphilitic lesions, and in bacterial infections unless used in conjunction with appropriate chemotherapy. Do not apply in large amounts or for prolonged periods during pregnancy.

In infants long-term continuous topical steroid therapy should be avoided. Adrenal suppression can occur, even without occlusion.

Pharmaceutical precautions No special precautions.

Legal category POM.

Package quantities Tubes of 30 g and 45 g.

Further information Clinical studies carried out in the United States, to determine the efficacy of the combination of hydrocortisone and coal-tar extract in comparison with hydrocortisone alone in the topical treatment of psoriasis and atopic dermatitis, suggest that the combination of hydrocortisone and coal-tar extract is superior to hydrocortisone alone in the majority of the conditions treated.

Product licence number 0036/5007.

STD Pharmaceutical Products Ltd

6 and 7 Broad Street

Hereford HR4 9AE

STD* INJECTION

Sodium Tetradecyl Sulphate Injection 3%

Presentation STD Injection is a sterile aqueous 3% solution of Sodium Tetradecyl Sulphate containing 2% Benzyl Alcohol and buffered to pH 7.6.

Uses The solution is designed for intravenous use and is used primarily as a sclerosant in the treatment of varicose veins of the leg by compression sclerotherapy.

The action of sodium tetradecyl sulphate in this technique is considered to be that of irritation to the intima of the vein wall, so that on compression of the vein fibrosis takes place and the vein is thus permanently occluded by a short fibrous cord therein.

Dosage and administration 0.5–1 ml at each of four sites (maximum 4 ml).

A dose of 0.5–1 ml is introduced into the superficial vein over the site of an incompetent perforating vein. It is never necessary or desirable to inject more than 1 ml at any one site and often half this volume will produce the desired effect. Three or four such injections can be given at the same visit into one limb.

The treatment of varicose veins by compression sclerotherapy is directed towards the restoration of the efficiency of the synchronised pumping systems within the leg by permanently destroying the leaking points rather than by the eradication of the superficial tortuous veins which may, in many cases, be capable of reverting to normal appearance and function after the restoration of the normal pattern of pressure within the veins of the limb.

Localisation of the perforating veins containing the injured valves is the supremely important object of diagnosis.

Treatment comprises the permanent blocking of the offending leak by producing a short fibrotic segment of vein involving the area of the junction of the perforating and superficial veins. This can be achieved by carrying out the following procedure:

1. Introducing the sclerosant into this vein after it has been emptied.

2. Maintaining the sclerosant in the empty and isolated segment for 30 seconds.

3. Applying compression immediately to the site of injection, maintaining it for a period of about six weeks, until one is quite sure that, when the patient stands erect, the internal pressure of the blood in the adjacent unobliterated vein cannot reopen the segment.

4. Application of compression is most suitably obtained by firm bandaging with a number of strong cotton crêpe bandages and by incorporating therein shaped rubber pads over the sites of injection.

An elastic stocking applied over the bandage aids compression and the retention of the bandages in position.

Contra-indications, warnings, etc The use of STD Injection of Sodium Tetradecyl Sulphate is not recommended for the treatment of varicose veins by compression

sclerotherapy when any of the following factors are present:

1. *Oral contraceptives*: Until such time as the ex-thromboplastic effect of the oral contraceptive tablet has been established, it is advisable not to use sclerotherapy on patients who are currently taking oral contraceptive.
2. *Inability to walk*: As the recommended treatment involves daily periods of walking by the patient it is not advisable to embark upon treatment if for any reason the patient cannot walk at least three miles each day.
3. *Obese legs*: It is recommended that patients with obese legs should not receive treatment. In many cases the obesity may be corrected by dieting, after which time treatment may be commenced.
4. *Any known allergy to sodium tetradecyl sulphate*: Treatment by injection of STD should not be continued if an allergic reaction has been experienced after previous injection of sodium tetradecyl sulphate.

Side-effects

1. (a) Allergy and Anaphylaxis – Rarely – see Precautions below.
(b) Allergy–Urticaria – see Precautions below.
2. Extravascular injection will give rise to pain, and may produce necrosis and ulceration (if close to surface).

Precautions

1. Allergy and Anaphylaxis:

- (a) History of allergy should be taken from all patient prior to treatment. In particular allergic reactions to previous injections of sodium tetradecyl sulphate should be noted (see contra-indication 4, above).
- (b) A higher incidence of allergic reaction is thought to result from repeated treatment involving Sodium Tetradecyl Sulphate Injection and may involve intervals of several years between courses of injection.

2. *Equipment of clinic*: The treatment of anaphylaxis may require, depending on severity of attack, some or all of the following: injection of adrenaline, injection of hydrocortisone, antihistamine injection, endotracheal tube, laryngoscope, mucus extraction pump. The treatment of varicose veins by STD injection should not be undertaken in clinics where these items are not readily available.

Pharmaceutical precautions Store in a cool place away from direct sunlight.

Legal category POM

Package quantities STD injection.

30 ml multidose containers.

100 × 1 ml single-dose ampoules.

Further information The use of a small dose, the isolation of the injection within the vein segment and the application of immediate, adequate and lasting compression are of supreme importance in obtaining a good result.

Product licence number 0398/5000.

DOXALIN*

Description Flat, round, white, uncoated tablets with bevelled edges, 16 mm in diameter, marked 'Droxalin' on both faces, containing:

polyhydroxyaluminium sodium carbonate	162 mg
magnesium Trisilicate BP	162 mg

Uses Droxalin is an antacid. It is recommended for the relief of gastric hyperacidity, dyspepsia, and symptoms of peptic ulcer.

Dosage and administration For oral administration only.

Adults: For hyperacidity: 1 or 2 tablets as required.

Peptic ulcer: 2 or more tablets, chewed every two or four hours, or when required for relief of symptoms.

Contra-indications, warnings, etc There are no known contra-indications or adverse reactions, and no cases of overdosage have been reported.

As the ingredients of Droxalin are not significantly

absorbed, systemic effects such as alkalosis due to changes in acid-base metabolism are not encountered.

The combination of aluminium and magnesium salts minimises constipating and laxative side-effects, which are rare and mild.

Pharmaceutical precautions None applicable.

Legal category GSL.

Package quantities Droxalin Tablets are available in packs of 30 and 180.

Further information The aluminium complex is rapidly activated by chewing to form a colloidal aluminium hydroxide gel, giving rapid relief of gastric hyperacidity and buffering gastric pH at an ideal non-alkaline level for long periods.

Each Droxalin tablet contains 7 to 9 mg sodium.

Product licence number 0071/5009.

ACIDOL* PEPSIN

Presentation Near-white, bi-convex tablets, 11 mm in diameter, plain on both sides with a characteristic odour. Each tablet contains 97 mg pepsin and 388 mg betaine hydrochloride.

Uses Acidol-Pepsin Tablets provide a source of hydrochloric acid and pepsin for patients with achlorhydria.

Dosage and administration For oral administration only.

The usual adult dose is 1-3 tablets crushed and dissolved in a tumbler of water three times a day, preferably after meals.

Contra-indications, warnings, etc There are no known contra-indications or side-effects.

If Acidol-Pepsin Tablets are swallowed whole they are likely to cause irritation and symptoms of indigestion: they should therefore always be taken dissolved in water.

Because hydrochloric acid can dissolve dental enamel, the solution is best taken through a straw or a glass tube to protect the teeth.

Overdosage has not been reported. Although the ingestion of large amounts of hydrochloric acid may raise the chloride and lower the bicarbonate content of the blood it is most unlikely that metabolic acidosis would occur as a result of taking Acidol-Pepsin.

Pharmaceutical precautions Store in well-closed containers. Protect from damp.

Legal category P.

Package quantities Acidol-Pepsin is supplied in bottles of 50 tablets.

Further information In solution, betaine hydrochloride forms free hydrochloric acid. Each Acidol-Pepsin Tablet is approximately equivalent to 1 ml of Dilute Hydrochloric Acid BP.

Product licence number 0071/5017.

AT10*

Presentation A clear, deep straw-coloured, oily solution with a faint nut-like odour containing 0.25 mg/ml Dihydroxyacetone BP.

Uses AT10 is recommended for use in the acute, chronic and latent forms of hypocalcaemic tetany due to hypoparathyroidism where its action is to increase the rate of absorption and utilisation of calcium. It may also be used to treat those skin lesions such as pemphigus and impetigo herpetiformis which are associated with hypoparathyroidism.

Dosage and administration AT10 is for oral administration only.

Adults: In acute cases 3-10 ml may be given on each of the first three days of treatment, followed two to three days later by blood and urinary calcium estimations. The maintenance dose of AT10 is usually within the range 1-7 ml each week, but the precise amount depends on the results of serum and urinary calcium determination.

In chronic cases an initial dose of 2 ml of AT10 daily or on alternate days, may be sufficient to maintain normocalcaemia in moderate cases. The dose of AT10 usually has to be increased during menstruation, pregnancy and periods of unusual activity.

Contra-indications, warnings, etc As with calciferol, uncontrolled, prolonged administration of AT10 can result in hypercalcaemia which may lead to nephrocalcinosis. Therefore accurate blood calcium determinations must be made at the beginning of treatment and then periodically until the required maintenance dose has been established. The serum calcium level should subsequently be kept between 2.25-2.5 mmol/litre.

The Sulkowitch test (for urinary calcium) is a convenient supplement to blood calcium determinations, but it should not be regarded as a substitute, because hypoparathyroid patients treated with AT10 hypercalcaemia can occur in the presence of hypocalcaemia.

Overdosage will result in hypercalcaemia. The symptoms (described below) usually respond to withdrawal of medication, bed rest, a liberal fluid intake, laxatives and a light diet.

Side-effects are most likely to be due to hypercalcaemia, the first signs of which are loss of appetite, listlessness and nausea. More severe manifestations include thirst, vertigo, urgency of micturition, stupor, headache, abdominal cramps and paralysis.

Pharmaceutical precautions Store in well-closed containers protected from heat and light.

Legal category P.

Package quantities AT10 is supplied in bottles containing 15 ml with a 1 ml dropper.

Further information The hypercalcaemic action of AT10 is slower in onset and more prolonged than that of parathyroid hormone, but faster in onset and less persistent in action than calciferol. In patients who have become resistant to large doses of calciferol it may be possible to control blood calcium levels with AT10.

Product licence number 0071/5020.

BREOPRIN*

Presentation White tablets 16 mm long and 7.5 mm wide, marked  on one side and scored on the other. Each tablet contains 648 mg micro-encapsulated aspirin.

Uses Breoprin Tablets may be used where aspirin is required and therefore are recommended for the relief of pain and stiffness associated with rheumatoid and osteoarthritis, rheumatism, bursitis, sprains, strains and neuralgia.

Breoprin is also recommended for the relief of symptoms of colds and influenza and in other minor painful conditions such as headache, toothache and menorrhoea.

Usage and administration *Adults:* Breoprin Tablets should be taken at approximately eight-hourly intervals, for example at 7.00 a.m., 1.00 p.m. and 9.00 p.m. Where large doses of aspirin are usually required as in acute rheumatoid conditions, each dose should consist of 2 tablets. In other cases the dose should be 1 tablet, though patients who experience pain or stiffness in the morning on rising may increase the last dose of the day to 2 tablets. No more than 6 tablets should be taken in 24 hours.

Children: Breoprin should not be given to children below the age of 14 years.

Contra-indications, warnings, etc

Contra-indications: Breoprin should not be given to patients with active peptic ulceration because aspirin may induce (occasionally major) gastro-intestinal haemorrhage. It should also be withheld from those known to be sensitive to aspirin, including those with haemophilia and similar coagulation disorders.

Precautions: There is clinical and epidemiological evidence for the safety of aspirin in human pregnancy. However, its use should be avoided at term because aspirin may prolong labour and contribute to maternal and neonatal bleeding.

Aspirin may enhance the effects of anticoagulants and inhibit the action of uricosuric agents. Because aspirin may precipitate bronchospasm, it can induce attacks of asthma in susceptible subjects.

Overdose: Aspirin overdose may be treated by gastric lavage with 0.5% sodium bicarbonate solution. If the condition is not serious, sodium bicarbonate and fluids by mouth will speed renal excretion of salicylate. In more serious cases, an intravenous infusion of 5% dextrose should be set up, supplemented by electrolytes and alkali as indicated by blood and urine analysis. Haemolysis may be necessary. Haemorrhage may require blood transfusions. The administration of vitamin K, either orally or parenterally, will restore prothrombin time to normal.

Side-effects: The main side-effects associated with aspirin therapy are dyspepsia and other signs of gastric irritation. They are likely to occur less frequently with Breoprin than with ordinary aspirin tablets because the croscapsulation causes the major part of the aspirin to be released in the small intestine. If tinnitus occurs, the dose should be reduced.

Pharmaceutical precautions Protect from moisture in well-closed containers.

Legal category P.

Package quantities Bottles of 100 tablets.

Further information Nil.

Product licence number 0071/0091.

BRONCHILATOR*

Presentation Bronchilator is an aerosol inhalant in the form of an oral nebuliser, delivering 250 metered doses by finger depression of an actuator. Each metered dose contains 0.350 mg isotharine mesylate, and 0.070 mg Phenylephrine Hydrochloride BP.

Uses Bronchilator provides effective and relatively long-lasting relief of bronchospasm in bronchial asthma and chronic bronchitis.

Dosage and administration Bronchilator is for oral inhalation only.

Adults: The usual dose is 1 or 2 inhalations and it is not normally necessary to repeat this dose at less than half-hourly intervals. In bronchial asthma 1 or 2 inhalations more may be required, but it is important to wait one full minute after the initial 1 or 2 inhalations, to be certain that relief has not been obtained. Not more than eight treatments should be taken in 24 hours.

Bronchilator should only be administered to children under the supervision of a responsible adult and strictly as recommended by the doctor.

Contra-indications, warnings, etc Bronchilator should not be given to patients taking MAO inhibitors.

As with other sympathomimetic amines, too frequent use of Bronchilator may cause tachycardia, palpitations, nausea, headache, changes in blood pressure, etc. Patients should therefore be advised not to exceed the recommended dose. Other sympathomimetic amines should be prescribed with caution in patients using Bronchilator. Dosage should be carefully adjusted in patients with hyperthyroidism, hypertension, coronary artery disease, cardiac asthma, limited cardiac reserve and in individuals sensitive to sympathomimetic amines.

Overdose: Serious symptoms are unlikely except after massive overdose. They may be treated in the same way as those due to adrenaline overdose (i.e. injection of piperhexan or phenolamine). Slow intravenous procaine or procainamide should be used for fibrillation, and artificial respiration and oxygen for cyanosis and respiratory embarrassment.

Side-effects: When used as recommended, side-effects are rare. A small drop in pulse rate and blood pressure may follow inhalation of Bronchilator.

Pharmaceutical precautions Keep away from extreme heat.

Legal category POM.

Package quantities Complete nebuliser containing 12.5 ml of solution (equivalent to 250 doses).

Refills containing 12.5 ml.

Further information Nil.

Product licence number 0071/5024.

ERADACIN* ▼

Presentation Eradacin capsules are No. 1 opaque, red/yellow capsules filled with a white powder. Each capsule contains 150 mg acroloxacin (rosaloxacin I.N.N.)

Uses Eradacin is for the treatment of acute gonorrhoea in both male and female patients.

Dosage and administration Eradacin is for oral administration only.

Adults: Two capsules (300 mg) preferably on an empty stomach.

Children: No recommendations.

Contra-indications, warnings, etc Safe use during human pregnancy has not yet been established and Eradacin should be used only when necessitated by the anticipated bacteriological and clinical benefits.

It should be used with caution in patients with impaired renal or hepatic function.

Eradacin may cause dizziness and drowsiness. Patients should therefore be warned not to drive or operate machinery if affected. Occasionally, headaches and gastro-intestinal upsets may occur.

Eradacin has been shown to induce lesions in weight-bearing joints of young animals receiving high, single or repeated doses. The relevance of this to man is unknown but it is recommended that frequent, repeat doses should not be given to those under 18 years of age.

Overdosage: Animal toxicity studies suggest that CNS depression is a likely symptom of overdosage. If vomiting does not occur, the drug should be removed by emesis or gastric lavage, if ingestion is recent, and symptomatic treatment applied.

Pharmaceutical precautions None.

Legal category POM.

Package quantities Eradacin is supplied in packs of 20 capsules.

Further information A single dose of 300 mg Eradacin has been shown to produce a cure rate of over 90% in cases of uncomplicated gonococcal urethritis. Treatment with Eradacin may be successful in patients infected with *N. gonorrhoeae* strains resistant to penicillin and other antibiotics.

Product licence number 0071/0168.

HYPAQUE* 25% AND 45% HYPAQUE* SODIUM

Presentation Hypaque is a sterile, almost colourless aqueous solution in clear glass ampoules or infusion bottles containing either 25% w/v or 45% w/v Sodium Diatrizoate BP.

Hypaque Sodium is a white, odourless powder with a saline taste consisting of Sodium Diatrizoate BP. The anhydrous material contains 59.87% of iodine.

Uses An X-ray contrast medium suitable for intravenous and retrograde urography, angiography, venography and many other specialised procedures. It may also be used orally or rectally to examine the gastro-intestinal tract.

Dosage and administration The volume and concentration of Hypaque solution used depends on the procedure being carried out. The strengths and quantities given in the table opposite are suggested.

Examination of the gastro-intestinal tract: For adults an average dose of from 100 to 150 ml of a 25–50% solution is suggested when given by mouth or tube. From 500 ml to 1,000 ml of 20–35% solution is suggested as an enema.

For infants or children the oral or tube dose may vary from 50 ml to 120 ml of a 10–25% solution, and as an enema from 100 ml to 500 ml of a 10–15% solution may be used. The following formulae may be used to make a flavoured draught from Hypaque Sodium.

	1	2	3
Hypaque Sodium	30 g*	30 g*	30 g*
Sucrose	26.41 g	—	—
Methyl <i>p</i> -hydroxybenzoate	0.1 g	0.08 g	0.08
Propyl <i>p</i> -hydroxybenzoate	0.01 g	—	—
Butyl <i>p</i> -hydroxybenzoate	0.004 g	—	—
Sodium saccharin	0.03 g	0.3 g	0.3 g
Tween 80	0.08 g	—	0.08
Vanillin	—	0.2 g	0.2 g
Purified water q.s. ad.	75 ml	75 ml	75 ml

* Or an appropriate amount for the strength of solution required.

Contra-indications, warnings, etc Hypaque should not be used for myelography. Injection of even a small amount into the subarachnoid space may produce convulsions and result in fatality.

It was formerly believed that the use of contrast media was contra-indicated in patients with advanced renal destruction associated with severe uraemia, and in those with severe hepatic and cardiac disorders. However, a review concludes that although there appear to be definite contra-indications, potentially hazardous situations requiring particular care are oliguric renal failure, myeloma and combined renal and hepatic failure.

Examination	Strength (%)	Amount of medium used (ml)	
		Adults	Children
Urography:			
i.v.	45	0.5–2.0/kg	as adult

		to a total of 10–12 each side	
Myelography	45	3	—
Duct mammography	25	1–2	—
Discography	45	0.5 max. 2.0	—

No attempt should be made to dehydrate the uraemic patient, nor should dehydration be carried out in a patient with myeloma. Recent evidence suggests that in the latter case it is dehydration rather than the presence of myeloma protein which has been the cause of adverse effects. Prior purgation should also be avoided. As with any other X-ray examination the hazards must be balanced against the clinical need for information.

pregnancy the examination should be delayed until 12–14 weeks after delivery whenever possible.

Should urine be tested for albumin within four to six hours after a Hypaque injection, crystals of diatrizoic acid may separate out on acidification with mineral acid, but these crystals are easily distinguished from the amorphous albumin precipitate. Hypaque does not affect acetate or heat coagulation tests.

Organic iodine contrast media are known to remain in the blood serum of patients for periods varying from two days to several years in concentrations sufficient to interfere with tests of thyroid function such as protein-bound iodine determinations. It has been reported that diatrizoic acid remains in the serum for four days. It is therefore advisable to perform such thyroid function tests before any examination involving the use of Hypaque.

Patients with a history of allergy, especially to iodine, and those with active tuberculosis require careful consideration. Because of the possibility of inducing a temporary suppression of urine, it is wise to allow an interval of at least 24 hours before repeating excretory retrograde pyelography in patients with unilateral obstruction of normal renal function.

The precise nature of the reactions which occur with contrast media are not fully understood, although some seem to be allergic, and major reactions resemble those due to histamine release. Most minor reactions such as pain, giddiness, a feeling of warmth, coughing, nausea and vomiting pass off quickly. Minor allergic disturbances such as sneezing, rhinorrhoea, lacrimation and pruritus or urticarial rashes are relatively benign and respond to antihistamine treatment. Where patients complain of headache it may possibly be due to fluid deprivation.

There is no satisfactory way of pre-testing which will allow the prediction of a severe reaction, but the following precautions may help to minimise reactions, according to some workers:

1. Obtain a history of personal or familial allergies, of previous iodine studies, and of sensitivity to iodine and other drugs.
2. Make a preliminary sensitivity test by injecting intravenously a small dose (0.5–1 ml) followed by a period of observation long enough to detect delayed reactions. (Although allergic reactions generally occur quickly, on very rare occasions they may not appear for 1 or even 15 minutes.)
3. Give preliminary antihistamine medication.
4. Have drugs on hand for emergency use.

In examination of the gastro-intestinal tract, Hypaque should be used with caution in infants and debilitated elderly patients because hypovolaemia may develop due to the osmotic activity of the contrast material in the intestines.

Pharmaceutical precautions The sterile aqueous solutions are almost colourless. Hypaque is relatively thermostable and may be autoclaved if 0.0125 w/v diatrizoic acid is added to the solution, but sterile Hypaque solutions should not be re-autoclaved because of the possibility of free amine production. Solutions should be protected from light.

Legal category Hypaque injections POM.
Hypaque Sodium Powder P.

Package quantities *Hypaque 25%*: 20 ml ampoules in boxes of 5. Infusion bottles of 250 ml or 350 ml.

Hypaque 45%: 20 ml ampoules in boxes of 5 or 20. 30 ml ampoules in boxes of 20.

Product licence numbers

Hypaque 25% 0071/5044
Hypaque 45% 0071/5045
Hypaque Sodium 0071/5048

HYPAQUE* 65% AND 85%

Presentation Sterile, almost colourless aqueous solution in clear ampoules. Hypaque 65% contains Sodium Diatrizoate BP 25.23% w/v and meglumine diatrizoate 50.46%. (The iodine content of Hypaque 65% is equivalent to that of a 65% solution of sodium diatrizoate.)

Hypaque 85% contains Sodium Diatrizoate BP 28.33% w/v and meglumine diatrizoate 56.67% w/v.

At body temperature the solutions are clear, but at lower temperatures crystals may separate out. The solid readily dissolves when heated to 40°C or 45°C and recrystallisation does not occur for several hours.

Uses An X-ray contrast medium for angiocardiology, aortography, venography and other examinations.

Dosage and administration Hypaque is for parenteral use, oral administration for gastro-intestinal examinations and rectal administration as an enema.

The volume and concentration of Hypaque Solution used depend on the procedure being carried out.

When concentrations of Hypaque other than 85%, 65%, 45% or 25% are required, they can be obtained either by diluting a stronger medium with normal saline, or by mixing suitable amounts of two media.

The strengths and quantities given in the table on the next page are suggested.

Examination of the gastro-intestinal tract: For adults an average dose of 100–150 ml of a 25–50% solution is suggested when given by mouth or tube. From 500 ml to 1,000 ml of 20–35% solution is suggested for an enema.

For infants or children the oral or tube dose may vary from 50 ml to 120 ml of a 10–25% solution, and as an enema from 100 ml to 500 ml of a 10–15% solution may be used. The following formulae may be used to prepare a flavoured draught from Hypaque 85%:

	1	2	3
Hypaque 85%*	40 ml*	40 ml*	40 ml*

INTEGRIN* CAPSULES

Presentation Integrin Capsules are No. 4 white opaque; hard gelatine capsules marked Integrin 10 on both cap and body and filled with a fine, off-white powder. Each capsule contains 10 mg oxypertine.

Uses Integrin Capsules are recommended for the treatment of acute and chronic anxiety states, a psychosomatic condition whether or not accompanied by depressive overlay, tension, apprehension, agitation or sleep disturbance.

Dosage and administration For oral administration only.

Adults: 10 mg three or four times daily, usually after meals. In certain cases up to 60 mg daily in divided doses may be needed.

Contra-indications, warnings, etc Because oxypertine can bring about the release of small amounts of catecholamines in experimental animals, it would be wise not to give Integrin with, or within three weeks of the use of monoamine oxidase inhibitors. Integrin may potentiate the effect of alcohol or other tranquillising agents should, therefore, be warned against excessive use of alcohol and, as with all tranquillisers, patients

ould also be warned to observe caution in car driving id similar situations. Although tests on pregnant rabbits omers' test) have revealed no teratogenic effects from yperetine the benefits of using Integrin in the first mester of pregnancy should be weighed against the ssible risks.

verdosage: Possible effects of overdosage might in- ude central and respiratory depression and hypoten- on. Gastric lavage may be indicated, otherwise treat- ent should be symptomatic and supportive.

de-effects: No serious toxic reactions have been ported with Integrin treatment. Even in high doses it as been well tolerated with only minor, often transient, de-effects appearing. As would be expected from the armacological properties of the compound, drowsi- ss may occur in some patients, and a few individuals ay complain of mild side-effects such as dry mouth and ziness.

harmaceutical precautions Protect from moisture id heat.

egal category POM.

ackage quantities Integrin 10 mg Capsules are ailable in bottles of 100.

urther information Nil.

roduct licence number 0071/5049.

ITEGRIN* TABLETS

resentation Integrin 40 mg Tablets are white, slightly eckled, flat tablets with bevelled edges, 8.7 mm in ameter, marked 'int' on one side and scored on the her. Each tablet contains 40 mg oxypertine.

ses Integrin 40 mg Tablets are recommended for the eatment of psychotics. They are particularly useful in ithdrawn schizophrenics. Integrin 40 mg Tablets may so be used in acute incidents of mental disturbances ich as acute agitation, behavioural disturbances, delir- m, and acute and subacute psychoses, including the anic phase of manic-depressive psychoses.

osage and administration For oral administration ly.

adults: The usual dose is 2-3 tablets (80-120 mg) daily idvided doses. This may be varied according to the ental state and the clinical response of the patient, but ie total daily dosage should not exceed 300 mg.

ontra-indications, warnings, etc Because oxy- rtine can bring about the release of small amounts of itecholamines in experimental animals, it would be ise not to give Integrin with or within three weeks of ie use of monoamine oxidase inhibitors. Oxypertine ay potentiate the central depressant effect of alcohol id other tranquillisers.

Although tests on pregnant rabbits (Somers' test) ave revealed no teratogenic effects from oxypertine the enefits of using Integrin in the first trimester of egnancy should be weighed against the possible risks. Patients have received up to 360 mg a day and one as received a maximum of 560 mg a day without toxic ffects.

verdosage: Possible effects of overdosage might in- ude central and respiratory depression and hypoten- on. Gastric lavage may be indicated, otherwise treat- ent should be symptomatic and supportive.

Side-effects: These are difficult to evaluate in the psychiatric patient. Adverse reactions reported have been mostly of a minor character and include extrapyr- amidal effects, sedation, dizziness and vomiting. Extra- pyramidal effects including restlessness may occur when high doses are used in the treatment of schizophrenia, but are rare at lower dose levels. Some observers have found that the incidence is less than with other commonly used psychotropic drugs. When these effects do occur they are readily controlled with appropriate therapy. Some patients complain of mild side-effects such as dry mouth and nasal congestion which are probably due to the autonomic effects of the drug.

There have been very few reports of hypotensive episodes such as occur with the phenothiazines. Mod- erately raised serum transaminase levels have been reported in some patients as well as occasional eosino- philia in high doses.

Pharmaceutical precautions Nil.

Legal category POM.

Package quantities Integrin Tablets are available in bottles of 250.

Further information Nil.

Product licence number 0071/5050.

MODRENAL* ▼

Presentation Modrenal capsules are size 3, opaque, pink/black gelatin capsules, marked SRL 60, each con- taining 60 mg trilostane.

Uses Modrenal is for the control of the manifestations of adrenal cortical hyperfunction in such conditions as hypercortisolism and primary aldosteronism.

Dosage and administration Modrenal is for oral administration only.

Adults: One capsule (60 mg) four times a day for at least 3 days. Thereafter, the dose may be reduced or increased, according to the patient's clinical response and the results of appropriate biochemical tests. The normal dosage range is 120 mg to 480 mg per day in divided doses, but in a few patients the daily dose has been increased stepwise to 960 mg.

Children: There are no dosage recommendations for children.

Contra-indications, warnings, etc Modrenal is contra-indicated in pregnant patients. Steps should be taken to exclude pregnancy before starting treatment with Modrenal and non-hormonal contraceptive meas- ures should be taken during the course of treatment.

As with all drugs which are metabolised by the liver and excreted by the kidney, caution should be exercised in treating patients with renal or hepatic dysfunction.

Although Modrenal will not produce adrenal shut- down or Addisonian crisis, except in patients with a pituitary adenoma, it is advisable to monitor therapeutic response by regular assay of circulating corticosteroids and blood electrolytes until the presence of an ACTH- producing tumour has been excluded. If a patient taking Modrenal develops a severe illness or needs surgery, it may be advisable to administer corticosteroids.

Information on long-term effects is not yet available.

Drug Interaction: If Modrenal is administered concu- rently with thiazide or 'loop' type diuretics, its effect of

inhibiting aldosterone production reduces the loss of K⁺ ions in the urine usually seen with these drugs.

Overdosage: If recently ingested, the drug should be removed by emesis or gastric lavage. Subsequent treatment will depend on the effect the drug has had on blood electrolytes and circulating corticosteroids.

Side-effects: When administered as recommended above, side-effects are likely to be rare. During acute tolerance studies, side-effects were only troublesome when high initial doses (500–1,000 mg daily) were given; they included flushing, nausea, vomiting, rhinorrhoea, and palatal oedema. All were reversible on stopping treatment.

Pharmaceutical precautions Nil.

Legal category POM.

Package quantities Modrenal capsules are supplied in bottles of 100.

Further information Modrenal selectively and reversibly reduces to normal limits both mineralo- and gluco-corticoids by inhibiting an enzyme system essential for their production (3 β -hydroxysteroid dehydrogenase/ Δ^5 -3-oxosteroid isomerase).

Product licence number 0071/0129.

MONODRAL*

Presentation Monodral Tablets are yellow, bi-convex tablets, 8 mm in diameter, marked 'W' on one side and scored on the other. Each tablet contains 5.0 mg penthienate methobromide.

Uses Monodral Tablets are recommended for the treatment of gastric hypermotility and hypersecretion. They may be used to relieve pain in peptic ulcer and stress dyspepsia.

Dosage and administration Monodral Tablets are for oral administration only. Dosage should be adjusted to individual needs.

Adults:

1. **Peptic ulcer:** The average dose is 1 tablet three times daily, with an additional dose at night if required. Some patients may require higher doses in the initial stages, especially when pain is severe, but a daily dose of 40 mg should be regarded as the maximum and this amount should be given for short periods only. When symptoms are controlled the dose should be reduced to the effective minimum.

2. **Stress Dyspepsia:** Small doses are often sufficient to relieve symptoms and a dosage of $\frac{1}{2}$ tablet (2.5 mg) three or four times daily is usually used.

Contra-indications, warnings, etc Monodral should not be given in the presence of glaucoma because of the possibility of a mydriatic or cycloplegic effect. Pyloric obstruction and obstruction of the neck of the urinary bladder are also contra-indications because of reduction of motility and tonus; consequently care is needed in patients with prostatic hypertrophy. Although tachycardia is rare, severe heart disease, where a possible increase in cardiac rate would be dangerous, is a further contra-indication.

Overdosage: This has not been reported with Monodral. The signs of acute toxicity would probably resemble those of atropine. Treatment should consist of gastric lavage, and physostigmine parenterally is an antidote.

Excitement may occur, but care is needed in administering sedatives because depression may occur as a late symptom of toxicity.

Side-effects: These are unusual at low doses. At high doses, atropine-like effects such as blurring of vision, difficulty of micturition and dryness of the mouth may occur.

Pharmaceutical precautions Nil.

Legal category POM.

Package quantities Monodral is supplied in bottles of 100 tablets.

Further information Nil.

Product licence number 0071/5063.

MYTELASE*

Presentation Mytelase Tablets are white, bi-convex film-coated tablets, 6.4 mm in diameter, marked 'MY' and scored on one side and plain on the other side. Each tablet contains 10 mg ambenonium chloride.

Uses Mytelase Tablets are recommended for the treatment of myasthenia gravis.

Dosage and administration For oral administration only.

Adults: For the patient with moderately severe myasthenia, from 5 mg to 25 mg ($\frac{1}{2}$ –2 $\frac{1}{2}$ tablets) three or four times daily is recommended. Some patients require as little as 5 mg per dose; others require as much as 50 to 70 mg per dose.

It is recommended that treatment should start with 5 mg dose, the effect of the drug in each patient being carefully observed. The dosage may be gradually increased to determine the effective and safe dose for each patient.

In addition to the individual variation in dosage requirements, the amount of cholinergic medication necessary to control symptoms may fluctuate in each patient, depending on his activity and the current state of the disease, including spontaneous remission.

A few patients may require greater doses for adequate control of the myasthenic symptoms, but increasing the dosage above 200 mg daily requires exacting supervision by a physician well aware of the signs and treatment of overdosage with cholinergic medication.

Since the warning of overdosage is minimal and the requirements of patients vary tremendously, great care and supervision are required. That a narrow margin exists between the first appearance of side-effects and serious toxic effects must be borne in mind constantly. Caution in increasing dosage is essential.

Contra-indications, warnings, etc Atropine must not be administered routinely with Mytelase. Simultaneous administration of other antimuscarinic drugs should only take place under strict medical supervision. Use with caution in patients with asthma or with mechanical intestinal or urinary obstruction. Since warning of overdosage is minimal and the requirements of patients vary tremendously, great care and supervision are required.

Overstimulation with Mytelase has a clinical picture of increasing parasympathomimetic action which is more or less characteristic (when not masked by the use of atropine).

verdosage: Signs and symptoms of overdosage, including cholinergic crises, vary considerably. They are usually manifested by increasing gastro-intestinal stimulation with epigastric distress, abdominal cramps, arrhoea and vomiting, excessive salivation, pallor, cold sweating, urinary urgency and blurring of vision. Eventually fasciculation and paralysis of voluntary muscles including those of the tongue (thick tongue and difficulty swallowing), shoulder, neck and arms develop. Icterus, increase in blood pressure, with or without arrhythmia, and finally subjective sensations of internal trembling and often severe anxiety and panic may complete the picture. A cholinergic crisis can usually be differentiated from the weakness and paralysis of myasthenia gravis, inadequately treated with cholinergic drugs, by the fact that myasthenic weakness is not accompanied by any of the above signs and symptoms except the last two subjective ones (of anxiety and panic).

If signs of overdosage occur with Mytelase (excessive gastro-intestinal stimulation, excessive salivation, icterus and more serious fasciculations of voluntary muscles) discontinue temporarily all cholinergic medication and administer from 0.5 to 1 mg of atropine intravenously. Give other supportive treatment as indicated (artificial respiration, tracheotomy, oxygen, etc.).

pharmaceutical precautions Nil.

legal category POM.

package quantities Mytelase is available in bottles of 30 tablets.

further information Nil.

product licence number 0071/5066.

EGRAM*

presentation Negram Suspension is a deep pink, viscous suspension with a raspberry odour and taste containing 300 mg Nalidixic Acid BP per 5 ml dose.

Ne gram Tablets are beige, bi-convex tablets, 12.7 mm diameter, marked 'Negram' on one side and with a symbol on the other. Each tablet contains 500 mg of Nalidixic Acid BP.

uses Negram is recommended for the treatment of acute or chronic infections, especially those of the urinary and gastro-intestinal tracts, caused by Gram-negative pathogens sensitive to nalidixic acid.

usage and administration *Adults:* For acute infections, 1 g four times daily for at least seven days, reducing to 0.5 g four times a day for chronic infections.

Children: For those over the age of three months, the maximum recommended dose is 50 mg/kg body weight per day in divided doses.

Not recommended for those less than three months of age.

contra-indications, warnings, etc Negram is contra-indicated for patients with a history of convulsive disorders. It should be used with caution in patients with liver disease. Patients should avoid excessive exposure to sunlight. Although there is no evidence that nalidixic acid has any harmful effect during pregnancy, careful consideration should be given to its use during the first trimester. When treating women who are breast feeding, consideration should be given to the fact that traces of nalidixic acid are excreted in the milk.

When Negram is given to patients on anticoagulant therapy, it may be necessary to reduce the anticoagulant dosage. Negram may precipitate a haemolytic reaction in G-6-PD deficient individuals.

Nalidixic acid has been shown to induce lesions in weight-bearing joints of young animals. The relevance of this to man is unknown. The possible risk of late degenerative joint changes in young patients receiving nalidixic acid preparations should therefore be considered. If symptoms of arthralgia occur, treatment with nalidixic acid should be stopped.

Although care should be exercised in treating patients with renal failure, the full dosage of Negram may be administered in patients with creatinine clearance of more than 20 ml/min and half the normal dosage in patients with creatinine clearance less than this. Nalidixic acid in therapeutic doses can interfere with the estimation of urinary 17-ketosteroids and may cause high results in the assay of urinary vanilmandelic acid (Pisano method).

Active proliferation of the organisms is a necessary condition for the antibacterial action of nalidixic acid: the action of Negram may therefore be inhibited by the presence of other antibacterial substances.

When testing for glycosuria in patients receiving Negram, glucose-specific methods based on glucose oxidase should be used because copper reduction methods may give false-positive results.

Overdosage: In adults, symptoms of overdosage have been noted following single doses of 20 and 25 g. These have included toxic psychosis, convulsions and metabolic acidosis.

In an emergency, it is suggested that the stomach should be emptied, and symptomatic treatment applied as necessary, a particular watch being kept for central or respiratory depression.

Side-effects: Gastro-intestinal effects, skin reactions or subjective visual disturbances may occur but are readily reversible on reduction or discontinuation of therapy. There are isolated reports of convulsive episodes usually associated with overdosage or certain predisposing factors, and of raised intracranial pressure in infants. These are reversible when the drug is discontinued.

Pharmaceutical precautions Where doses of less than 5 ml are ordered, Negram Suspension may be diluted with Syrup BP so that the standard 5 ml spoonful can be given. Such dilutions will remain stable for two to three weeks.

Legal category POM.

Package quantities *Negram Suspension:* Bottles of 150 ml or 500 ml.

Negram Tablets: Boxes of 56 tablets (7 strips of 8 tablets) and (for hospitals only) bottles of 500 tablets.

Further information Nil.

Product licence numbers

Negram Suspension 0071/5067

Negram Tablets 0071/5068.

STROMBA*

Presentation 1. Stromba Tablets are flat, white tablets 9.5 mm in diameter, marked Stromba on one side and scored in quarters on the other side. Each tablet contains 5 mg stanozolol.

2. Stromba Injection consists of clear glass ampoules,

2 ml capacity, each containing stanozolol 50 mg in 1 ml aqueous suspension.

Uses Stromba Tablets may be used in the management of post-menopausal and senile osteoporosis and in patients suffering from anorexia, asthenia or chronic debilitating diseases where dietary measures alone have proved unsuccessful.

Stromba has been shown to significantly increase plasminogen activator activity measured by euglobulin clot lysis time and plasma plasminogen as well as significantly reducing plasma fibrogen and α_2 macroglobulin, a plasmin inhibitor.

Stromba Tablets may, therefore, be used for the control of the vascular symptoms of cutaneous vasculitis, Raynaud's syndrome in patients with scleroderma, and in the vasculitis of Behçet's disease; for the prevention of recurrent venous thrombosis as occurs with antithrombin III deficiency and the treatment of the complications of deep vein thrombosis as in venous lipodermatosclerosis.

Stromba Injection may be used to treat severe conditions where an anabolic effect is required to correct a negative nitrogen balance, as, for example, in major trauma, severe burns or emaciating diseases. It may also be of value in the management of anaemias (including those associated with neoplastic disease) and in the management of terminal cancer patients.

Dosage and administration

1. *Stromba Tablets: Adults:* One 5 mg tablet daily. For vascular complications, up to 10 mg daily is recommended.

Children: Under 6 years – $\frac{1}{2}$ tablet daily.

6–10 years – $\frac{1}{2}$ –1 tablet daily.

It is suggested that the tablets should be administered to children in short courses of six to eight weeks. More than one course may be given with an interval of one month between courses.

2. *Stromba Injection: Adults:* 50 mg (1 ml) administered by deep intramuscular injection once every 2–3 weeks.

Contra-indications, warnings, etc Stromba should not be used in cases of cancer of the prostate because the condition is androgen-dependent. Because of possible virilising effects on a female foetus, Stromba should not be administered to pregnant women.

Stromba should be used with caution in the presence of impaired renal or cardiac function as it may encourage sodium and water retention.

Care should be taken in administering Stromba in patients with liver dysfunction. Such patients should be monitored by means of routine liver function tests and treatment discontinued if signs of deterioration are observed.

Tumours of the liver have been reported occasionally in patients subjected to prolonged treatment with androgenic-anabolic steroids, especially patients with Fanconi's syndrome and aplastic anaemia. These tumours, however, are not typical of primary hepatocellular carcinoma and, in some cases, discontinuation of steroids has resulted in tumour regression without other therapy. The possibility that these compounds may induce or enhance the development of such hepatic tumours cannot at present be excluded and this should be considered when the use of this product is proposed for long-term treatment, particularly in young people who are not suffering from life-threatening disorders. The use of stanozolol may result in an alteration in the ratio of

high and low density lipoproteins. The significance of this is not understood.

Anabolic steroids may increase sensitivity to anticoagulants; therefore, the dose of the latter may have to be decreased in order to maintain the prothrombin time at the desired therapeutic level.

Prolonged use in children may lead to premature closure of the epiphyses.

Overdosage: There are no reports of chronic or acute overdosage with Stromba. By analogy with other substances of this type, one would expect chronic overdosage to be associated with the signs and symptoms caused by excessive circulating androgens. It is unlikely that any immediate serious reactions would be seen in a single excessive dose (in animals acute toxicity cannot be measured). In such an event, however, the patient should be kept under observation in case of delayed reactions.

Side-effects: Because of the structural relationship to the male hormones, some androgenic side-effects are to be expected, but, because the ratio of anabolic to androgenic properties is high, these effects will be minimal at the recommended dosage. The androgenic effects so far reported have been mild and are usually only seen in young people. Other effects, not related to androgenicity, such as headache, euphoria, depression and cramp have also occurred occasionally. There have been occasional reports of cholestatic jaundice.

Pharmaceutical precautions Each ampoule should be thoroughly shaken before use. Protect from light.

Legal category POM.

Package quantities 1. *Stromba Tablets:* Bottles of 50 or 200 tablets.

2. *Stromba Injection:* Plastic boxes each containing 1 ampoules.

Further information Nil.

Stromba Tablets 0071/5092

Stromba Injection 0071/0031

TELEPAQUE*

Presentation Telepaque Tablets are off-white to buff bi-convex tablets, 10.3 mm in diameter and plain on both sides. Each tablet contains 500 mg lipoic acid BP.

Uses Telepaque Tablets are recommended for oral cholecystography and cholangiography.

Dosage and administration Telepaque Tablets are usually given 10–14 hours before cholecystography.

Adults:

1. The usual dose is 6 Telepaque Tablets swallowed whole with at least one full glass of water. Eight tablets may be given to very obese patients. For repeat examinations on the same day as the original procedure an additional 6 tablets may be administered. However if the repeat examination is to be performed with double dose of Telepaque a period of five to seven days should be allowed between the two examinations. No more than 12 tablets should be taken during a 24-hour period.

2. In order to obtain better visualisation of the extrahepatic ducts, 9–12 tablets may be given in 2 doses. Three to six tablets are given four hours after a fatty meal.

n the day preceding the examination, and then a full dose of 6 tablets after a fat-free meal in the evening.

Another technique is to administer a double dose (12 tablets) of Telepaque after a 12-hour fast, followed by ml Camphorated Opium Tincture BP to close the sphincter of Oddi. Films may be taken 5–14 hours later, and any sphincter pain caused by the tincture may be eased with an anticholinergic. As noted above, 12 tablets is the maximum dose which should be administered in 4 hours.

3. Certain biliary calculi only become radiographically opaque after prolonged exposure to the contrast medium. Such prolonged exposure to Telepaque can be obtained by the following regimen. Patients are instructed to take two Telepaque Tablets after each of the three main meals, daily for four days. During this time the meals should be relatively fat-free. The X-ray examination is made on the morning of the fifth day, the patient fasting.

Contra-indications, warnings, etc Telepaque is contra-indicated in patients with advanced hepatorenal disease or severe impairment of renal function. It should not be given to patients with gastro-intestinal disorders which interfere with absorption and result in inadequate isualisation. Telepaque may also be contra-indicated in patients who are sensitive to iodine compounds. Caution is also necessary in patients suffering from cholangitis or marked hyperthyroidism.

In patients with severe advanced liver disease, renal function should be assessed before cholecystography, and renal output and hepatic function should be observed for a few days after the procedure. Observation of renal function after multiple doses of the contrast medium has also been recommended. Iopanoic acid has a uricosuric effect approximately equivalent to that of probenecid. Although this action cannot be definitely linked with nephrotoxicity, it has been strongly recommended that adequate hydration should be encouraged as a possible means of decreasing the risk of renal complications.

Patients with pre-existing renal disease should not receive double doses of cholecystographic media. It is possible that renal irritation in susceptible individuals could result in reflex vascular spasm with partial or complete renal shutdown. It is therefore suggested that kidney function in patients with renal disease should be assessed before administration of cholecystographic media, and for several days afterwards.

Fatal coronary occlusion in four patients with arteriosclerotic heart disease who had taken a cholecystographic agent has been reported and premedication with tropine is a reasonable prophylactic measure against vagal stimulation if cholecystography is necessary in patients with recent symptoms of coronary artery disease. However, the connection between these fatalities and the administration of the contrast media (iopanoic acid in two cases and iodoaliphonic acid in the other two) may have been wholly fortuitous. It has also been suggested that the administration of large doses of other aromatic iodine compounds like urographic and angiographic agents with or shortly following cholecystographic agents may increase the likelihood of toxic reactions.

The most frequently reported adverse reactions have been mild and transient nausea, vomiting, diarrhoea and cramps. A stinging sensation during urination occurs occasionally and has been attributed to urethral irritation. It does not indicate any renal or upper urinary tract trouble. Skin reactions such as urticaria, pruritus and flushing rarely occur.

Thrombocytopenia after two 3 g doses has been reported in a patient with a history of conjunctival haemorrhages. Acute renal failure with complete recovery has been reported in four patients, three of whom were given doses of Telepaque which were higher than those recommended.

Pharmaceutical precautions Nil.

Legal category P.

Package quantities Cartons of 36 tablets packed in aluminium foil strips of 6.

Further information Nil.

Product licence number 0071/5095.

TRANCOPRIN®

Presentation White, flat-bevelled edge tablets 11 mm in diameter, marked with a 'T' on one face and scored on the other. Each tablet contains Aspirin BP 300 mg and chlormezanone 100 mg.

Uses For the treatment of painful conditions where the combination of an analgesic and a mild tranquilliser/muscle relaxant would be of value. Such conditions include musculoskeletal disorders associated with muscle spasm, headache and painful menstrual disorders.

Dosage and administration Trancoprin tablets are for oral administration only. The usual adult dose is 1 or 2 tablets three times a day. Not more than 8 tablets should be taken daily. There are no specific recommendations for children.

Contra-indications, warnings, etc Trancoprin tablets should not be given to patients with a known hypersensitivity to chlormezanone or aspirin (including those with haemophilia and similar coagulation disorders) nor to those who are also taking monoamine oxidase inhibitors. They should not be taken by patients with a history of peptic ulcer because aspirin may induce (occasionally major) intestinal haemorrhage. Chlormezanone in high doses may modify the patient's reactions (performance of skilled tasks, alertness, etc.) to a varying extent, depending upon individual susceptibility. Therefore, patients should be advised not to drive or operate machinery during treatment if affected. If Trancoprin is administered with CNS depressants, it is possible that their sedative effect may be intensified. As with other drugs acting on the central nervous system, patients should avoid alcohol while receiving Trancoprin since the response cannot be predicted.

There is clinical and epidemiological evidence of the safety of aspirin (but not of chlormezanone) in human pregnancy. Because aspirin may prolong labour and contribute to maternal and neonatal bleeding, the use of Trancoprin is best avoided at term. Aspirin may enhance the effect of anticoagulants and inhibit the action of uricosuric agents: because it may precipitate bronchospasm, it may induce attacks of asthma in susceptible subjects.

Overdosage should be treated by gastric lavage (if the product has been recently ingested) together with the usual measures taken for salicylate toxicity. There are likely to be additional symptoms due to the excessive amount of chlormezanone absorbed, such as somnolence, depression and prostration. There may also be muscular incoordination, blurred vision, weakness and

memory disturbances. In severe cases, hypotension, respiratory depression and loss of consciousness may occur. Symptomatic treatment is suggested for chlormezanone overdosage.

Side-effects: Adverse effects have been infrequent with Trancoprin. As would be expected with chlormezanone, a compound having mild tranquillising properties, drowsiness and dizziness have been the commonest.

There have also been occasional reports of constipation, flushing, dry mouth, nausea, weakness and rash. Very rarely reversible cholestatic jaundice has been reported in patients who have taken chlormezanone.

The dependence potential of chlormezanone is not known.

Pharmaceutical precautions Trancoprin tablets should be kept in well-closed containers protected from moisture.

Legal category POM.

Package quantities Amber glass bottles, each containing 100 tablets.

Further information Nil.

Product licence number 0071/0093.

VERIPAQUE*

Presentation Veripaque Powder is a fine, white powder containing 50 mg oxyphenisatin in 3 g.

Uses Veripaque is recommended: a) for adding to barium enemas in radiological examination of the large intestine; b) as a cleansing enema to remove colonic gas and faeces before plain abdominal radiography, intravenous pyelography, cholecystography, proctosigmoidoscopy, etc; c) for pre-operative cleansing of the large intestine.

Dosage and administration Veripaque Powder is used for the preparation of enemas for rectal administration.

Adults: Veripaque enemas should be administered slowly

over a period of five to eight minutes with the fluid level 18–24 inches above the hips.

As a cleansing enema prior to diagnostic or surgical procedures, 3 g of Veripaque Powder is dissolved in litres of water.

When used as an adjuvant to a barium enema, 3 Veripaque Powder is mixed thoroughly with 2 litres of barium enema suspension.

Contra-indications, warnings, etc Care is needed in patients with an irritable colon or inflammatory diseases of the large intestine; in such cases Veripaque should be used in smaller than usual doses. As with other enemas Veripaque is not recommended in cases of appendicitis, gross bleeding from the bowel, intestinal obstruction, severe spasm or severe diarrhoea, or where there is danger of intestinal perforation. Reduced dosage is recommended for elderly or debilitated patients. Although when used in small and infrequent doses as in preparations for radiography it may well be harmless, regular, prolonged use should be discouraged because of the possibility of liver toxicity. Minor side-effects such as cramps, diarrhoea, nausea and vomiting, sweating or tachycardia may occur infrequently and can usually be obviated by decreasing the dosage. The cramps, which occur in about 8% of cases, usually produce only mild discomfort and do not interfere with completion of the procedure.

As with tannic acid, more serious side-effects such as syncope may occur occasionally; they are usually caused by administration of too large a dose.

Pharmaceutical precautions Nil.

Legal category P.

Package quantities Boxes of 6 vials each containing 3 g Veripaque Powder.

Further information Nil.

Product licence number 0071/5099.

* Trade Mark

CETOXYL* 2.5

Presentation Acetoxyl 2.5 contains 2.5% benzoyl peroxide in an aqueous acetone gel base. The gel is visible and non-greasy when applied to the skin.

Uses Acetoxyl 2.5 is indicated as an aid in the treatment of acne vulgaris.

The gel base allows the active substance, benzoyl peroxide, to penetrate into the acne follicle, where it exerts an antibacterial effect against *Propionobacterium* *acnes*.

Dosage and administration The gel should be carefully applied to the affected areas once daily. Washing with soap and water prior to application greatly enhances the efficacy of the preparation.

The response to benzoyl peroxide can vary from patient to patient and in some cases the higher strength, cetoxyl 5, may be required.

Contra-indications, warnings, etc Patients with a known sensitivity to benzoyl peroxide should not use this product.

Take care to keep the product away from the mouth, the eyes and other mucous membranes to avoid irritation. The product should only be applied to other sensitive areas, such as the skin of the neck, with caution.

For external use only.

In normal use a mild burning sensation will probably be felt on first application and a moderate reddening and peeling of the skin will occur within a few days. During the first few weeks of treatment a sudden increase in peeling will occur in most patients. This is not harmful and will subside in a day or two if the treatment is temporarily discontinued.

If discomfort such as burning, redness or excess peeling occurs, discontinue treatment temporarily or consult a doctor.

Keep out of reach of children.

The product may bleach coloured fabrics.

Pharmaceutical precautions Store in a cool place.

Legal category P.

Package quantities Acetoxyl 2.5 is available in tubes containing 40 g.

Further information Nil.

Product licence number 0174/0041.

CETOXYL* 5

Presentation Acetoxyl 5 contains 5% benzoyl peroxide in an aqueous acetone gel base. The gel is invisible and non-greasy when applied to the skin.

Uses Acetoxyl 5 is indicated as an aid in the treatment of acne vulgaris.

The gel base allows the active substance, benzoyl

peroxide, to penetrate into the acne follicle, where it exerts an antibacterial effect against *Propionobacterium* *acnes*.

Dosage and administration The gel should be carefully applied to the affected areas once daily. Washing with soap and water prior to application greatly enhances the efficacy of the preparation.

The response to benzoyl peroxide can vary from patient to patient. Should any undue reaction occur, it may be necessary to use the lower strength, Acetoxyl 2.5.

Contra-indications, warnings, etc Patients with a known sensitivity to benzoyl peroxide should not use this product.

Take care to keep the product away from the mouth, the eyes and other mucous membranes to avoid irritation. The product should only be applied to other sensitive areas, such as the skin of the neck, with caution.

For external use only.

In normal use a mild burning sensation will probably be felt on first application and a moderate reddening and peeling of the skin will occur within a few days. During the first few weeks of treatment a sudden increase in peeling will occur in most patients. This is not harmful and will subside in a day or two if the treatment is temporarily discontinued.

If discomfort such as burning, redness or excess peeling occurs, discontinue treatment temporarily or consult a doctor.

Keep out of reach of children.

The product may bleach coloured fabrics.

Pharmaceutical precautions Store in a cool place.

Legal category P.

Package quantities Acetoxyl 5 is available in tubes containing 40 g.

Further information Nil.

Product licence number 0174/0039.

BENOXYL* 5

Presentation Benoxyl 5 is available as a white lotion or cream containing benzoyl peroxide 5%. It is non-greasy, odourless and non-staining – completely invisible on the skin.

Uses Benoxyl 5 is indicated in the treatment of acne vulgaris. The active ingredient, benzoyl peroxide, is an antibacterial and mild keratolytic agent.

Benoxyl may be applied in conjunction with other topical preparations such as salicylic acid and antibacterials.

Dosage and administration Benoxyl 5 lotion or cream should be applied to the affected areas once daily.

Washing with soap and water prior to application greatly enhances the efficacy of the preparation.

Should discomfort such as burning, redness or excessive peeling occur at any point, treatment should be discontinued and resumed when discomfort subsides.

As the skin becomes tolerant to Benoxyl 5, peeling will diminish. When this occurs Benoxyl 10 should be used.

Contra-indications, warnings, etc Allergic sensitivity to Benoxyl is rare.

A mild burning sensation may be noticed on first application and moderate erythema and desquamation appear within a few days. Indiscriminate application may produce a marked erythema. Such conditions will subside if treatment is discontinued for a few days. Benoxyl may bleach clothing, bed linen and, very rarely, eyebrows and hair.

Pharmaceutical precautions Benoxyl lotions and creams should be stored in a cool, dark place.

Legal category P.

Package quantities *Cream:* 40 g. *Lotion:* 30 ml.

Further information Nil.

Lotion 0174/5003

Cream 0174/5007

BENOXYL* 5 WITH SULPHUR

Presentation Benoxyl 5 with Sulphur is available as an off-white lotion or cream. It contains benzoyl peroxide 5% and sulphur 2%. It is non-greasy, odourless and non-staining – completely invisible on the skin.

Uses Benoxyl 5 with Sulphur is indicated in the treatment of acne vulgaris. The active ingredient, benzoyl peroxide, is an antibacterial and mild keratolytic agent. In Benoxyl 5 with Sulphur the activity of the benzoyl peroxide is enhanced by the addition of sulphur.

While the traditional remedies, sulphur and resorcinol, cause marked epidermal reactions, the combination of benzoyl peroxide and sulphur acts predominantly at a deeper level, closer to the site of acne pathology. Benoxyl may be applied in conjunction with other topical preparations such as salicylic acid and antibacterials.

Dosage and administration Benoxyl 5 with Sulphur lotion or cream should be applied to the affected areas once daily. Washing with soap and water prior to application greatly enhances the efficacy of the preparation.

In cases of severe or resistant acne, Benoxyl 10 with Sulphur may eventually be required.

Contra-indications, warnings, etc Allergic sensitivity to Benoxyl is rare.

A mild burning sensation may be noticed on first application and moderate erythema and desquamation appear within a few days. Indiscriminate application may produce a marked erythema. Such conditions will subside if treatment is discontinued for a few days. Benoxyl may bleach clothing, bed linen and, very rarely, eyebrows and hair.

Pharmaceutical precautions Benoxyl lotions and creams should be stored in a cool, dark place.

BENOXYL* 10

Presentation Benoxyl 10 is available as a white lotion containing benzoyl peroxide 10%. It is non-greasy, odourless and non-staining – completely invisible on the skin.

Uses Benoxyl 10 is indicated in the treatment of acne vulgaris. The active ingredient, benzoyl peroxide, is an antibacterial and mild keratolytic agent.

Benoxyl 10 may be applied in conjunction with other topical preparations such as salicylic acid and antibacterials.

Dosage and administration Benoxyl 10 lotion should be applied to the affected areas once daily. Washing with soap and water prior to application greatly enhances the efficacy of the preparation.

Should discomfort such as burning, redness or excessive peeling occur at any point, treatment should be discontinued and resumed when discomfort subsides. Alternatively Benoxyl 5 (5% benzoyl peroxide) may be used.

Contra-indications, warnings, etc Allergic sensitivity to Benoxyl is rare.

A mild burning sensation may be noticed on first application and moderate erythema and desquamation appear within a few days. Indiscriminate application may produce a marked erythema. Such conditions will subside if treatment is discontinued for a few days. Benoxyl may bleach clothing, bed linen and, very rarely, eyebrows and hair.

BENOXYL* 10 WITH SULPHUR

Presentation Benoxyl 10 with Sulphur is available as an off-white lotion or cream. It contains benzoyl peroxide 10% and sulphur 5%. It is non-greasy, odourless and non-staining – completely invisible on the skin.

Uses Benoxyl 10 with Sulphur is indicated in the treatment of acne vulgaris. The active ingredient, benzoyl peroxide, is an antibacterial and mild keratolytic agent. In Benoxyl 10 with Sulphur the activity of the benzoyl peroxide is enhanced by the addition of sulphur.

While the traditional remedies, sulphur and resorcinol caused marked epidermal reactions, the combination of benzoyl peroxide and sulphur acts predominantly at a deeper level, closer to the site of acne pathology. Benoxyl may be applied in conjunction with other topical preparations such as salicylic acid and antibacterials.

usage and administration Treatment should normally start with Benoxyl 5 (5% benzoyl peroxide). As the skin becomes tolerant to Benoxyl 5, peeling will diminish. When this occurs, Benoxyl 5 with Sulphur (5% benzoyl peroxide with 2% sulphur) should be used.

Benoxyl 10 with Sulphur lotion or cream should be applied to the affected areas once daily. Washing with soap and water prior to application greatly enhances the efficacy of the preparation.

contra-indications, warnings, etc Allergic sensitivity to Benoxyl is rare.

A mild burning sensation may be noticed on first application and moderate erythema and desquamation appear within a few days. Indiscriminate application may produce a marked erythema. Such conditions will subside if treatment is discontinued for a few days. Benoxyl may bleach clothing, bed linen and, very rarely, eyebrows and hair.

BRASIVOL

Presentation Benoxyl 20 Lotion contains benzoyl peroxide 20% in a stabilised lotion base.

Uses Benoxyl 20 Lotion is indicated in the management of Cutaneous Ulcers.

Dosage and administration Apply a protective ointment to the skin area bordering the ulcer. Cut a thick dressing such as an abdominal pad, or cotton wool between gauze layers to fit the size and shape of the ulcer exactly. Moisten the dressing with normal saline or water. Saturate the dressing with Benoxyl 20 and apply to the ulcer with sterile forceps, and apply over this a piece of thin plastic film to extend just beyond the ulcer margin.

Change the dressing every eight hours for large ulcers and every 12 hours for small ulcers. To hold the dressing in place cover it with a large pad, such as an amputation pad, and tape this firmly in place with hypoallergenic tape. For ulcers with cavities, saturate surgical ribbon gauze with Benoxyl 20 Lotion and pack into the cavities with sterile forceps, so that the Benoxyl 20 comes into contact with every area of the ulcer cavity, and then proceed as above. Renew packing at each dressing. In lesions of the legs a supporting bandage may be advantageous.

Contra-indications, warnings, etc Keep away from the mouth, eyes and other mucous membranes to avoid irritation. Avoid normal skin. Irritant dermatitis has been reported in 2.5% to 3% of cases, if undue skin irritation develops, the use of the product should be discontinued. The product may bleach coloured fabrics. For external use only.

pharmaceutical precautions Store in a cool place.

legal category POM.

Package quantities Benoxyl 20 Lotion is supplied in bottles containing 100 ml.

Further information For excess granulation growth use a dilute Silver Nitrate preparation to reduce it to just below epidermal level. Analgesics may be needed for the first few days of treatment.

Product licence number 0174/0036.

BRÄSIVOL

Presentation Bräsivol is an abrasive cleansing paste in three grades, each containing graded particles of fused synthetic aluminium oxide in a non-irritant soap-detergent base.

Bräsivol No. 1 Fine is an off-white paste containing 38.09% aluminium oxide.

Bräsivol No. 2 Medium is a light-blue paste containing 52.2% aluminium oxide.

Bräsivol No. 3 Coarse is a light-green paste containing 65.2% aluminium oxide.

Uses Bräsivol is indicated in the treatment of acne vulgaris. Bräsivol effectively cleanses and removes debris from blocked pores and removes excess sebum from the skin, thus maintaining patency of the pore duct openings.

Dosage and administration The patient should commence treatment with Bräsivol No. 1 Fine. The abrasive cleansing paste should be applied by the patient to the wetted skin and rubbed gently but firmly over the affected area with a circular motion for about 30 seconds, then rinsed off thoroughly with water. This routine may be repeated one to three times daily, replacing ordinary soap and water.

In more severe conditions, after the use of Bräsivol No. 1 Fine for several weeks, the skin may require the slightly more abrasive action of Bräsivol No. 2 Medium and subsequently the longer-term maintenance may require the use of Bräsivol No. 3 Coarse.

Contra-indications, warnings, etc Bräsivol is contra-indicated in the presence of superficial venules and telangiectasia (actinic sequelae).

Care should be taken to avoid using Bräsivol close to the eyes or mouth and male patients using an electric razor should shave before applying Bräsivol.

A degree of dryness and redness will be seen during the first few days of treatment. Over-enthusiastic use, however, can cause irritation and, if this occurs, treatment should be interrupted for a day or two and then resumed.

Pharmaceutical precautions Protect from heat.

Legal category GSL.

Package quantities

Bräsivol No. 1 Fine. 70 g.

Bräsivol No. 2 Medium. 85 g.

Bräsivol No. 3 Coarse. 100 g.

Further information Bräsivol satisfies the patient's need to take an active part in the treatment of his condition but reduces to a minimum the desire for self-manipulation in the form of squeezing and picking of lesions.

Product licence numbers

Bräsivol No. 1 Fine 0174/5000

Bräsivol No. 2 Medium 0174/5001

Bräsivol No. 3 Coarse 0174/5002

DRICLOR*

Presentation Driclor is a clear colourless alcoholic solution containing 20% w/w aluminium chloride hexahydrate.

Uses Driclor is indicated for the treatment of hyperhidrosis of the axillae, the hands and the feet.

Dosage and administration Last thing at night carefully dry the affected areas and apply the product. Wash off in the morning. Do not re-apply the product during the day.

Initially the product may be applied each night until sweating stops during the day. The frequency of application may then be reduced to twice a week. Subsequently if sweating is still absent the frequency of application may be reduced to once a week or in some cases less frequently.

Contra-indications, warnings, etc Ensure that the affected areas to be treated are perfectly dry.

Do not apply the product to broken or irritated areas of skin.

Do not bathe immediately before application of the product. Allow at least one hour following bathing.

Do not shave armpits for 24 hours before or after use of the product.

Avoid direct contact with clothing and polished metal surfaces.

The product is inflammable.

For external use only.

Keep out of the reach of children.

Keep away from the eyes.

The reduction in sweating which the product causes may produce some temporary irritation or redness. If this becomes excessive stop the treatment temporarily and if necessary consult a doctor.

Pharmaceutical precautions The cap of Driclor should always be replaced tightly after use.

Driclor should be stored in an upright position.

Store in a cool place.

Legal category POM.

Package quantities 60ml in roll-on applicator plastic bottle.

Further information Driclor may cause irritation which is troublesome but not severe enough to warrant discontinuing its use. In these circumstances the irritation may be alleviated by the use of a weak hydrocortisone cream.

Product licence number 0174/0044.

DUOFILM*

Presentation Duofilm is an almost colourless, clear, mobile liquid supplied in an amber screw-capped bottle, internally fitted with a brush applicator.

Duofilm is a collodion based product containing:

Salicylic Acid BP 16.70% w/w

Lactic Acid BP 16.70% w/w

Uses Duofilm is for topical application only and is indicated in the treatment of plantar and mosaic warts.

Dosage and administration The patient should be instructed as follows:

1. Soak warts in hot water for five minutes.

2. Rub surface of warts carefully with pumice stone or manicure emery board.

3. Apply Duofilm taking care to avoid normal skin.

4. Allow to dry thoroughly and cover with plaster wart is large or on the foot.

5. Continue treatment until the wart is completely cleared and ridge lines of the skin have been restored.

Contra-indications, warnings, etc Duofilm is product formulated for the controlled corrosion of keratin. Care must be taken to apply the product to the wart only. Avoid applying to normal skin.

Duofilm should not be used on the face or anogenital regions.

Keep away from naked flame.

Pharmaceutical precautions Highly inflammable. Store in a cool place. Keep out of the reach of children.

Legal category P.

Package quantities Duofilm is available in an amber screw-capped applicator bottle containing 15 ml.

Further information Duofilm is prescribable on FP10.

Product licence number 0174/0025.

LACTICARE*

Presentation Lacticare contains Lactic Acid 5% and Sodium Pyrrolidone Carboxylate 2.5% in an oil-in-water viscous lotion base.

Uses Lacticare is indicated for the symptomatic relief of hyperkeratotic and other chronic dry skin condition and for dry skin conditions caused by low humidity or the use of detergents.

Dosage and administration Use as required on affected areas or as directed by a doctor. Shake well before use.

Contra-indications, warnings, etc Occasionally a transient mild stinging sensation may occur. Should prolonged irritation develop when used on abraded or inflamed skin, discontinue use.

Keep away from the eyes and mucous membranes. Should contact with the eyes occur, remove with water.

Keep out of the reach of children.

For external use only.

Pharmaceutical precautions Nil.

Legal category P.

Package quantities Bottles containing 150 ml.

Further information Nil.

Product licence number 0174/0038

OILATUM* CREAM

Presentation Oilatum Cream is a white, stable, oil-in-water cream containing Arachis Oil BP 21%. Impermeability is provided by the incorporation of 1% polyvinyl pyrrolidone (PVPK 30) in the oil phase.

Mineral oil and lanolin derivatives are avoided.

Uses Oilatum Cream is indicated in cases of dry sensitive skin, lanolin sensitivity, alkali intolerance, ichthyosis and similar conditions.

The use of Oilatum Cream in such conditions reduces:

moisture loss from the stratum corneum and thus restores flexibility.

The use of an inert plastic in the oil phase ensures a continuous residual film which tends to be more occlusive and longer-lasting than ordinary vegetable oils.

Dosage and administration Oilatum Cream, which may be used as often as required, is applied to the affected area and rubbed well in. It is especially effective immediately after washing, when the normal acid condition of the skin may be disturbed and when the sebaceous content of the stratum corneum may be depleted.

Contra-indications, warnings, etc Nil.

Pharmaceutical precautions Protect from heat.

Legal category P.

Package quantities Oilatum Cream is available in tubes containing 40 g.

Further information The rapid symptomatic relief obtainable with Oilatum Cream is achieved by the use of an oil-in-water cream which provides a higher moisture content than is possible with water-in-oil preparations. After the evaporation and absorption of the water phase, the residual oil droplets coalesce to form an occlusive film.

Oilatum Cream is prescribable on FP10.

Product licence number 0174/5014.

OILATUM* EMOLLIENT

Presentation Oilatum Emollient is a semi-dispersing emulsion additive producing an emulsion of dispersed oil in bath water and a homogenised film on the surface. Oilatum Emollient, which is a colourless liquid, contains the following active ingredients:

Octylated wool alcohols	5.0%
liquid paraffin	63.7%

Uses Oilatum Emollient is indicated in the treatment of contact dermatitis, atopic dermatitis, senile pruritus, ichthyosis and related dry skin conditions. Oilatum emollient replaces oil and water and hydrates the keratin. Oilatum Emollient is particularly suitable for infant bathing. The preparation also overcomes the problem of cleansing the skin in conditions where the use of soaps, soap substitutes and colloid or oat-meal baths proves irritating.

Dosage and administration Oilatum Emollient should always be used with water, either added to the bath or applied to wet skin.

1. **Bath:** Add 1–3 capsul to an 8 inch bath of water. Soak for 10–20 minutes.

2. **For infant bathing:** Add ½–2 capsul to a wash-basin of water. Apply gently over entire body with sponge and bat dry.

3. **Direct to skin:** Wet the skin of the affected area and rub in a small quantity of Oilatum Emollient. Rinse and bat dry.

Where conditions permit, and particularly in cases of extensive areas of dry skin, Oilatum Emollient should be used as a bath oil, ensuring complete coverage by immersion. In addition to the therapeutic benefits, this method of use provides a means of sedating tense patients, particularly relevant in cases of acute pruritic

dermatoses where relaxation of tension appears to relieve symptoms.

Contra-indications, warnings, etc The patient should be advised to use care to avoid slipping in the bath.

Pharmaceutical precautions Protect from heat.

Legal category P.

Package quantities Oilatum Emollient is available in bottles containing 150 ml and 350 ml. A dispensing pack containing 1 litre is also available.

Further information Oilatum Emollient is prescribable on FP10.

Product licence number 0174/5010.

PANOXYL* 5 ACNE GEL PANOXYL* 10 ACNE GEL

Presentation Panoxyl 5 contains 5% benzoyl peroxide in a white gel base formulated with colloidal magnesium aluminium silicate, hydroxypropylmethyl-cellulose ethyl alcohol, polyoxyethylene lauryl ether, citric acid and purified water.

Panoxyl 10 contains 10% benzoyl peroxide in a gel base formulated as mentioned above for Panoxyl 5.

Uses Panoxyl 5 and 10 are each indicated for use as an aid in the treatment of acne. Benzoyl peroxide provides a drying and desquamative action, enhanced by the gel base, which is also invisible on the skin.

Dosage and administration Treatment should normally commence with Panoxyl 5. Apply the gel to the affected areas once daily. Washing with soap and water prior to application greatly enhances the efficacy of the preparation. The reaction of the skin to benzoyl peroxide differs in individual patients, and for this reason the higher percentage of benzoyl peroxide in Panoxyl 10 may be required in order to provide a satisfactory drying and desquamative action.

Contra-indications, warnings, etc Panoxyl 5 and 10 should not be prescribed for patients with a known sensitivity to benzoyl peroxide. Application to sensitive areas such as the neck should be made with caution; to avoid irritation there should be no contact with eyes, mouth and other mucous membranes.

In normal use, a mild burning sensation will probably be felt on first application and a moderate reddening and peeling of the skin will occur within a few days. During the first few weeks of treatment a sudden increase in peeling will occur in most patients; this is not harmful and will subside within a day or two if treatment is temporarily discontinued.

Panoxyl 5 and Panoxyl 10 may bleach dyed fabrics and thus care should be taken with clothing and bed linen if coloured.

Pharmaceutical precautions Store in a cool place.

Legal category P.

Package quantities Panoxyl 5 and Panoxyl 10 are supplied in tubes each containing 40 g.

Further information Nil.

Product licence numbers

Panoxyl 5 0174/0019

Panoxyl 10 0174/0020

POLYTAR* EMOLLIENT

Presentation Polytar Emollient is a black liquid concentrated tar bath additive containing a unique combination of tars. The ingredients are as follows:

Tar BP	7.5%
Cade Oil BPC	7.5%
Coal Tar Solution	2.5%
Arachis oil extract of crude coal tar	7.5%
Liquid Paraffin BP	35%

Polytar Emollient makes available more active tar per ml than other bath additives containing only extracts in solution.

Uses Polytar Emollient is indicated in the treatment of psoriasis, eczema, atopic and pruritic dermatoses. The use of Polytar Emollient may be combined with ultraviolet radiation and other adjunctive therapy.

Polytar Emollient is also of value in removing loose psoriatic scales and paste following dithranol treatment.

Dosage and administration Two to four capful of Polytar Emollient should be added to an 8 inch bath and the patient instructed to bathe for 20 minutes.

Clinical studies have revealed that this is the optimum period for maximum absorption; after this time the rate of absorption decreases rapidly.

Contra-indications, warnings, etc Patients should be instructed to guard against slipping when entering or leaving the bath.

If irritation occurs and persists, discontinue use.

Pharmaceutical precautions Protect from heat.

Legal category GSL.

Package quantities Polytar Emollient is available in bottles of 250 ml. A dispensing pack containing 1 litre is also available.

Further information Studies have confirmed that Polytar Emollient ranks highly in terms of patient acceptability.

Unlike liquor picis carbonis, Polytar Emollient will not stain the bath, hair or skin. Furthermore, Polytar Emollient contains a bath oil to eliminate any drying of the skin.

Polytar Emollient is prescribable on FP10 for the treatment of psoriasis, eczema, atopic and pruritic dermatoses.

Product licence number 0174/5011.

POLYTAR* LIQUID

Presentation Polytar Liquid is a light-brown liquid concentrated, antiseptic, tar-medicated scalp cleanser adjusted to pH 5.5, containing the following active ingredients:

Tar BP	0.3%
Cade Oil BPC	0.3%
Coal Tar Solution	0.1%
Arachis oil extract of crude coal tar	0.3%
Oleyl alcohol	1.00%

Uses Polytar Liquid is indicated in the treatment of scalp disorders such as psoriasis, dandruff, seborrhoea, eczema and pruritus. Polytar Liquid is also of value in the removal of pastes and pomades used in the treatment of psoriasis.

Dosage and administration The hair should be wetted and sufficient Polytar Liquid applied to produce

an abundant lather. The scalp and adjacent areas should be vigorously massaged with the fingertips. The hair should then be thoroughly rinsed and the procedure repeated.

Polytar Liquid should be used once or twice weekly

Contra-indications, warnings, etc Nil.

Pharmaceutical precautions Protect from heat.

Legal category GSL.

Package quantities Polytar Liquid is available in bottles of 65 ml, 150 ml and 350 ml. A dispensing pack containing 1 litre is also available.

Further information Polytar Liquid is prescribable on FP10 for psoriasis, eczema and seborrhoea of the scalp and dandruff.

Product licence number 0174/5016.

POLYTAR PLUS*

Presentation Polytar Plus is a concentrated antiseptic tar-medicated scalp cleanser containing the following active ingredients:

Tar BP	0.3%
Cade Oil BPC	0.3%
Coal Tar Solution	0.1%
Arachis Oil extract of crude coal tar	0.3%
Oleyl alcohol	1.0%
Hydrolysed Animal Protein	3.0%

Uses Polytar Plus is indicated in the treatment of scalp disorders such as dandruff, psoriasis, seborrhoea, eczema and pruritus. Polytar Plus is also of value in the removal of pastes and pomades used in the treatment of psoriasis.

Dosage and administration The hair should be wetted and sufficient Polytar Plus applied to produce an abundant lather. The scalp and adjacent areas should be vigorously massaged with the fingertips. The hair should then be thoroughly rinsed and the procedure repeated.

Polytar Plus should be used once or twice weekly.

Contra-indications, warnings, etc Nil.

Pharmaceutical precautions Store in a cool place.

Legal category P.

Package quantities Polytar Plus is available in bottles of 150 ml and 350 ml.

Further information Nil.

Product licence number 0174/0037.

SPECTRABAN* 4

Presentation Spectraban 4 contains isoamyl-p-N, N dimethylaminobenzoate 2.5% in ethyl alcohol. The lotion which is non-greasy and invisible on the skin, is blue in colour.

Uses Spectraban 4 is a protective sunscreen lotion indicated in patients at risk from exposure to ultraviolet light within the wavelength range 290–320 nanometres. It is this narrow waveband of ultraviolet light which is responsible for burning and tanning of the skin in summer. Use of the product should allow 4 times normal exposure to sunlight before burning.

Spectraban 4 is indicated in sun-sensitive conditions such as polymorphic light eruptions and solar urticaria.

id any condition made worse by UVB light such as pus erythematosus.

usage and administration Apply evenly and liberally to areas to be exposed or protected only by light clothing. Allow 45 minutes before swimming or sweating reducing exercise. A single application may give day long protection but the product should be re-applied during prolonged sunning, after excessive sweating and swimming or as directed by a doctor.

contra-indications, warnings, etc Sunscreen preparations occasionally produce a sensitivity reaction. Although such occurrences are rare with Spectraban 4, treatment should be discontinued if a skin rash or irritation develops. For external use only. Avoid contact with the eyes. Avoid flame. May stain clothing. Keep out of the reach of children.

pharmaceutical precautions Keep in a cool dark place.

legal category P.

package quantities Spectraban 4 is available in bottles containing 150 ml.

further information Spectraban 4 is prescribable on FP10 for patients who require protection from ultraviolet radiation in photodermatoses. Severe photosensitivity, which may occur in patients with porphyria is usually the result of long wavelength ultraviolet radiation or visible light. The protective qualities of Spectraban 4 are within the erythral range, 290–320 nanometres.

product licence number 0174/5013.

SPECTRABAN* 15

Presentation Spectraban 15 contains isoamyl-p-N, l-dimethylaminobenzoate 2.5% and para-aminobenzoic acid 5% in ethyl alcohol. The lotion, which is non-greasy and invisible on the skin, is pink in colour.

Uses Spectraban 15 is a protective sunscreen lotion indicated in patients at risk from exposure to ultraviolet light within the wavelength range 290–320 nanometres. It is this narrow waveband of ultraviolet light which is responsible for burning and tanning of the skin in man. Use of the product should allow 15 times normal exposure to sunlight before burning.

Spectraban 15 is indicated in sun-sensitive conditions such as polymorphic light eruptions and solar urticaria and any condition made worse by UVB light such as pus erythematosus.

Dosage and administration Apply evenly and liberally to areas to be exposed or protected only by light clothing. Allow 45 minutes before swimming or sweating reducing exercise. A single application may give day long protection but the product should be re-applied during prolonged sunning, after excessive sweating and swimming or as directed by a doctor.

Contra-indications, warnings, etc Sunscreen preparations occasionally produce a sensitivity reaction. Although such occurrences are rare with Spectraban 15, treatment should be discontinued if a skin rash or irritation develops. For external use only. Avoid contact with the eyes. Avoid flame. Keep out of the reach of children. May stain clothing.

Pharmaceutical precautions Keep in a cool dark place.

Legal category P.

Package quantities Spectraban 15 is available in bottles containing 150 ml.

Further information Spectraban 15 is prescribable on FP10 for patients who require protection from ultraviolet radiation in photodermatoses. Severe photosensitivity, such as may occur in patients with porphyria is usually the result of long wavelength ultraviolet radiation or visible light. The protective qualities of Spectraban 15 are within the erythral range, 290–320 nanometres.

Product licence number 0174/0035.

STIE-LASAN* OINTMENT

Presentation Dithranol BP 0.4% in a pomade base containing cetyl alcohol, mineral oil, white soft paraffin and sodium lauryl sulphate with 0.4% w/w salicylic acid.

Uses As an aid in the treatment of psoriasis, Dithranol has been shown to inhibit enzyme metabolism and reduce the mitotic turnover which is accelerated in the psoriatic epidermis. Stie-Lasan Ointment has demonstrated a high degree of efficacy for scale removal and plaque resolution in resistant psoriasis.

Dosage and administration *When used on the skin:* At bedtime, apply Stie-Lasan Ointment to plaque sites, being careful to avoid surrounding normal areas. A protective film of soft white paraffin applied to areas surrounding the plaques may be helpful. In the morning, remove any remaining Stie-Lasan Ointment with warm oil, followed by a tar bath.

When used on the scalp: Before applying Stie-Lasan Ointment, a thin protective film of soft white paraffin should be applied to the ears and scalp margin to minimise any irritation in these areas. Stie-Lasan Ointment, which should be applied at bedtime, should be massaged generously into the affected areas of the scalp, using a pair of plastic gloves to avoid staining the hands. The Ointment may easily be removed each morning with a shampoo. Soap alone is not sufficient. When scales are gone, plaques flattened and no palpable differences exist between the site of the lesions and normal surrounding skin, treatment may be reduced to a maintenance level.

Contra-indications, warnings, etc Dithranol is a powerful irritant and Stie-Lasan Ointment must not be used on or near the eyes or in areas where inflammation is present. Do not use in acute eruptions, only on quiescent or chronic patches.

If any reaction indicating sensitivity is observed, discontinue use. If excessive erythema is observed on adjacent normal skin, reduce the frequency of application.

Wash hands thoroughly after use.

For external use only.

Stie-Lasan Ointment will stain fabrics and temporarily stain hair and surrounding skin areas.

Pharmaceutical precautions Store in a cool dark place. The use of diluents is not recommended.

Legal category P.

Package quantities 110 g.

STIEFEL LABORATORIES (UK) LIMITED

Further information Nil.

Product licence number 0174/0018.

ZEASORB* POWDER

Presentation ZeaSORB is an off-white, highly absorbent, soft, antiseptic dusting powder containing the following:

Finely pulverised maize core	45%
Chloroxylanol BPC	0.5%
Aluminium dihydroxyallantoinate	0.2%

Uses Intertrigo, hyperhidrosis, bromidrosis, prevention of tinea pedis and any other condition in which the absorption of fluid from the surface of the skin is desirable.

Dosage and administration The affected areas should be dried as thoroughly as possible before applying ZeaSORB Powder. The powder should be smoothed over the surface of the skin, between joints and in folds.

Contra-indications, warnings, etc Nil.

Pharmaceutical precautions Store in a cool dry place.

Legal category P.

Package quantities ZeaSORB Powder is available in sifter-top plastic containers of 30 g.

Further information ZeaSORB Powder absorbs more than twice as much moisture as any of the leading 1 dusting powders with which it has been compared.

Furthermore, many dusting powders cake after the absorption of moisture, forming small irritating masses. This has been overcome with ZeaSORB, which remains soft upon saturation.

Product licence number 0174/5015.

ANTASIL* LIQUID AND TABLETS

Presentation Antasil is presented as a white liquid and as white tablets, marked Stuart.

Each 5 ml of liquid contains Dried Aluminium Hydroxide Gel USP 400 mg, Magnesium Hydroxide USP 100 mg and Activated Polydimethylsiloxane 150 mg.

Each tablet contains Dried Aluminium Hydroxide Gel JSP 400 mg, Magnesium Hydroxide USP 400 mg and Activated Polydimethylsiloxane 250 mg.

Uses As an antacid/defatulant for symptomatic treatment of peptic ulcer, dyspepsia of functional or organic origin, heartburn in hiatus hernia or pregnancy, flatulence and abdominal distension, gastritis, oesophagitis and other conditions where hyperacidity or flatulence may be present.

Dosage and administration Antasil liquid – 5–30 ml is required, preferably between meals and at bedtime. Antasil tablets – one or two to be sucked or chewed as required, preferably between meals and at bedtime.

Contra-indications, warnings, etc

Contra-indications: There is no known contra-indication.

Precautions: Care should be taken in patients suffering from hypophosphataemia. It is probably wise to avoid any drug, including antacids, during the first trimester of pregnancy unless there are compelling reasons for their use.

Aluminium hydroxide may form a complex with tetracyclines and reduce absorption when given concomitantly.

Although the antacids in Antasil are balanced to minimise bowel reaction, mild diarrhoea may be experienced at high doses.

Pharmaceutical precautions *Storage conditions:* Antasil liquid and tablets should not be stored at extremes of temperature.

Legal category P.

Package quantities Antasil liquid is supplied in bottles containing 300 ml and the tablets in cartons of 60 (6 strips of 10 tablets).

Further information The antacids in Antasil are balanced to minimise bowel reaction. Activated Polydimethylsiloxane assists in breaking down bubble-trapped gas, allowing the antacids to disperse quickly reducing hyperacidity and protecting the gastric mucosa from the inflammatory effect of high acid levels.

Tablets 0029/0118
Liquid 0029/0119

DISADINE* DP (DRY POWDER SPRAY)

Presentation Disadine DP is presented in an aerosol can which dispenses a brown powder. It is a dry powder spray containing 0.5% Povidone Iodine USP in BP propellants.

Uses Disadine DP is a wide-spectrum antiseptic for topical use. It presents all the bactericidal, fungicidal and virucidal properties of iodine with little if any risk of the skin sensitisation associated with elemental iodine. Disadine DP is indicated for topical application in the treatment and prevention of infection in wounds, including burns, varicose ulcers and bed sores.

Dosage and administration The aerosol can of Disadine DP must be shaken before use. The area requiring treatment is sprayed from a distance of 6–10 inches (15–25 cm) until a light dusting of powder is deposited. When dry this forms a protective antiseptic layer over the area which has been sprayed.

Contra-indications, warnings, etc Care must be taken when Disadine DP is used on known iodine-sensitive subjects, although these do not normally react to povidone iodine.

Disadine DP must not be used on patients with non-toxic nodular colloid goitre.

In very rare cases Disadine DP may produce skin reactions with iodine-sensitive subjects. These reactions subside on cessation of treatment.

Avoid getting the powder into the eyes or nose.

In cases of overdosage, treatment must be symptomatic.

Povidone iodine can be absorbed systemically during the topical treatment of burns, the degree of absorption being proportional to the depth and extent of the burn. Prolonged treatment with povidone iodine of patients with severe and extensive burns may cause metabolic acidosis, hypernatraemia, and renal impairment. In patients at risk Disadine DP should be used with caution. Excessively high serum levels may be reduced by haemodialysis. Absorption of povidone iodine may interfere with thyroid function tests by causing an increase in protein bound iodine levels.

Pharmaceutical precautions The aerosol can of Disadine DP must be stored away from direct heat and must not be autoclaved. The product should be used directly from the aerosol container. The container must not be punctured or destroyed by burning, even when empty.

Legal category GSL.

Package quantities Disadine DP is supplied in a 150 g aerosol can.

Further information Nil.

Product licence number 0029/5903.

DISPRAY* ANTIBIOTIC POWDER SPRAY

Presentation Dispray Antibiotic Powder Spray is presented in an aerosol can which dispenses a white or faintly yellow sterile powder. Approximately 1.2 g of powder is contained in each can. Dispray Antibiotic Powder Spray contains a sterile antibiotic powder with the following composition:

Neomycin Sulphate PhEur	650,000 units
Bacitracin Zinc BP	10,000 units
Polymyxin B Sulphate PhEur	165,000 units

in BP propellants.

Uses Dispray Antibiotic Spray is a wide-spectrum antibiotic spray. It is intended for topical application to wounds, cuts, lacerations and burns, and is particularly suitable for use in destroying pathogens which may contaminate tissues during surgical procedures.

Dosage and administration Spray the area to be treated with a light dusting of powder from a distance of 25 cm (10 inches).

Adults: The maximum recommended application is one can per day for seven days. The dose of neomycin should not exceed 1 g daily for seven days (or its equivalent when smaller daily doses are administered).

Children: Particular care must be exercised when using this product for any indication in children. The maximum dose should be reduced in proportion to body weight as an absorbed dose of neomycin exceeding 15 mg/kg body weight/day* may be associated with ototoxic effects. Greater caution should be exercised when treating infants.

* Note: A 10 second burst from a Dispray container delivered 68 mg (range 55–81 mg) of the antibiotic powder mixture over a 5" diameter area (approximately 129 cm²). Spraying should, therefore, not exceed 2 seconds/kg body weight/day.

Contra-indications, warnings, etc Contra-indicated in patients with hypersensitivity to neomycin, bacitracin or polymyxin.

Ototoxicity (including irreversible hearing loss) and nephrotoxicity, which may also result in ototoxicity, have been reported in association with inappropriate dosing with neomycin and also with polymyxin B. Nephrotoxicity has also been reported with inappropriate dosing with bacitracin. Significant absorption of the three antibiotics may occur from broken or inflamed skin. The spray should not be used on large denuded areas, including those due to burns, sunburn, chronic ulcers and chronic inflammatory dermatoses. Special care should be exercised in the treatment of patients with established hearing loss.

Dispray Antibiotic is not indicated for the treatment of pruritus and minor skin disorders.

Concurrent administration with other preparations containing aminoglycoside antibiotics is not recommended.

The inappropriate use of topical antibiotics has been associated with the emergence of resistant strains of bacteria.

In patients with renal impairment the dose should be reduced accordingly.

Neomycin may rarely cause neuromuscular blockade and because it potentiates skeletal muscle-relaxant drugs, it may cause respiratory depression and arrest. The use of this product in the immediate pre- and post-operative period is not, therefore, advisable.

All the antibiotics used in Dispray Antibiotic are known to cause delayed hypersensitivity reactions when used topically.

Because insufficient evidence is available on the use of the product in pregnant or lactating mothers special precautions should be exercised in its use in these situations.

Avoid inhaling the spray.

In the case of overdosage the treatment should be symptomatic.

Pharmaceutical precautions Dispray aerosols must be protected from heat and direct sunlight and must not be autoclaved. The container must not be punctured or destroyed by burning, even when empty. The product should be used directly from the aerosol container.

Legal category POM.

Package quantities Dispray Antibiotic Spray is presented as an aerosol spray which has a net weight of 110 g (79 ml).

Further information Nil.

Product licence number 0029/5905.

DISPRAY* 1 QUICK PREP

Presentation Dispray 1 Quick Prep is supplied in a printed tin-plate aerosol can which dispenses a colourless liquid containing Chlorhexidine Gluconate Solution BP 2.5% (chlorhexidine gluconate 0.5% w/v) in 70% total alcohols as industrial methylated spirit with BP propellant.

Uses Dispray 1 is a powerful disinfectant used for rapid disinfection of the skin before operations, subcutaneous or intramuscular injections or before venepuncture.

Dosage and administration Dispray 1 Quick Prep is sprayed on to the surface to be disinfected from a distance of 4–8 inches (10–20 cm).

It is suitable for both adults and children.

Contra-indications, warnings, etc Dispray 1 Quick Prep is flammable and must not be used near fires or flames. It must only be applied externally and must be kept away from the eyes and aural canals.

Only very occasional cases of skin sensitivity to chlorhexidine gluconate have been reported. As the product is supplied as an aerosol spray, it is unlikely that the liquid will be ingested. Any product which enters the eyes, ears or mouth must be washed out immediately with water.

Pharmaceutical precautions Dispray 1 Quick Prep spray should be protected from heat, including exposure to bright sunlight and radiators. The aerosol must not be punctured or destroyed by burning even when empty.

The product should be used directly from its container. Hypochlorite bleaches may cause the development of brown stains in fabrics which have previously been in contact with chlorhexidine preparations. Oxidising bleaches such as sodium perborate should be used.

Legal category GSL.

Package quantities Dispray 1 Quick Prep is supplied as an aerosol can containing 400 ml.

Further information Nil.

Product licence number 0029/5900.

METOSYN* FAPG CREAM AND OINTMENT

Presentation Metosyn consists of the corticosteroid fluciclonide presented as FAPG Cream and as Ointment.

Metosyn FAPG Cream, fluciclonide 0.05% w/w is dissolved completely in propylene glycol with fattycohols added to produce a white, homogeneous, semisolid preparation. Metosyn Ointment contains fluciclonide 0.05% w/w completely dissolved in a petroleum base.

Uses Metosyn contains an effective topical corticosteroid, and is suitable for treating a wide variety of local inflammatory, pruritic and allergic disorders of the skin. It is indicated for topical application in the following conditions.

Eczema and dermatitis: Atopic eczema, seborrhoeic dermatitis, discoid eczema, pompholyx, contact dermatitis, neurodermatitis, intertrigo.

Non-specific ano-genital pruritus: prurigo. Psoriasis, lichen planus. Discoid lupus erythematosus.

Metosyn FAPG Cream may be used for wet or dry lesions. Metosyn Ointment, with its emollient effects, is particularly suitable for dry scaly lesions.

Dosage and administration A small quantity of Metosyn FAPG Cream or Metosyn Ointment should be applied three to four times daily to the affected area and massaged well in.

Once improvement is apparent, usage may be reduced to twice or even once daily. These instructions apply to both adults and children.

It is recommended that Metosyn is used undiluted (see Pharmaceutical precautions).

Contra-indications, warnings, etc

Contra-indications: Metosyn is contra-indicated in rosacea, acne and peri-oral dermatitis, all of which can be treated with oral tetracyclines and hydrocortisone if a topical steroid is required. As with all topical steroids, Metosyn is contra-indicated in tuberculous, syphilitic, fungal and viral infections of the skin.

Precautions: Where there is bacterial infection associated with an inflammatory skin condition, Metosyn should only be administered if adequate antibacterial cover is also given. Topical administration of corticosteroids to pregnant animals has been shown to cause abnormalities of foetal development. Although the relevance of this finding to human application has not been established, when topical steroid treatment is considered necessary during pregnancy, both the amount applied and the length of treatment should be minimised. Long-term continuous topical steroid therapy should be avoided since adrenal suppression can occur, particularly when infants are being treated.

Side-effects: As with all topical steroids, striae may occur after extensive use of Metosyn. Occasionally a stinging or mild itching sensation may be noticed on application of FAPG Cream.

Overdose: A 25 g tube of Metosyn FAPG Cream or Ointment contains 12.5 mg of fluciclonide. Toxic effects are not likely to occur following accidental oral ingestion. Similarly, the components of the vehicles, singly or collectively, have not been shown to produce toxic effects in these quantities.

Pharmaceutical precautions Metosyn should be stored in the original tube and protected from heat. It is recommended that the product be used undiluted. However, if dilution of Metosyn Ointment is required,

white soft paraffin should be used and special FAPG diluent should be used to dilute FAPG Cream.

Legal category POM.

Package quantities Tubes of 25 g and 100 g FAPG Cream.

Tubes of 25 g and 100 g Ointment.

Further information Metosyn FAPG Cream and Metosyn Ointment do not contain lanolin or parabens.

Product licence numbers

Metosyn FAPG Cream 0029/5071

Metosyn Ointment 0029/0133

SORBICHEW*

Presentation Sorbichew tablets contain isosorbide dinitrate.

The Chewable tablets are round, green, scored tablets embossed Stuart, each containing 5 mg isosorbide dinitrate.

Uses *Angina Pectoris:* Sorbichew tablets are to prevent or abort the acute attack.

Dosage and administration Sorbichew tablets are scored for easier dose adjustment.

Treatment of the acute attack: Either one or two Sorbichew tablets should be chewed until dissolved completely and swallowed.

Prevention of an expected attack: Immediately prior to the stressful event either one or two Sorbichew tablets should be chewed until dissolved completely and swallowed.

Contra-indications, warnings, etc

Contra-indications: A known sensitivity to the drug.

Warnings: The following adverse effects may be seen with isosorbide dinitrate.

1. Cutaneous vasodilation, headache, dizziness and weakness may occur. If headache is a problem, a temporary lowering of the dose, and the use of analgesics, may be necessary. In the majority of patients, headache diminishes or disappears after 1-3 weeks and optimum dosage may be achieved.

2. Postural hypotension.

3. The drug can act as a physiological antagonist to noradrenaline, acetylcholine, histamine and other agents.

4. Dry rash and/or exfoliative dermatitis may occasionally occur.

Overdose: Overdose should be treated symptomatically. The main symptom is likely to be hypotension and this may be treated by elevation of the legs to promote venous return.

Pharmaceutical precautions *Storage:* Although Sorbichew tablets are very stable and no special storage precautions are required, it is advised that in accordance with good pharmaceutical practice the tablets should be stored protected from heat and moisture.

Legal category P.

Package quantities Sorbichew: 5 mg chewable tablets are supplied in aluminium tubes of 100 and 500.

Further information Unlike glyceryl trinitrate, Sorbichew tablets are very stable and therefore loss of potency when carried by the patient does not normally occur.

Sorbichew has an approximate onset of action of two minutes and duration of action up to two hours.

Product licence number

Sorbichew 5 mg 0029/0109

SORBID* S.A.

Presentation Sorbid S.A. tablets contain isosorbide dinitrate.

Sorbid S.A. tablets are yellow, round, flat, bevel-edged tablets, embossed 'Stuart' on one side and '880' on the reverse side. Each tablet contains 40 mg of isosorbide dinitrate; 10 mg for immediate release and 30 mg in a sustained action formulation.

Uses *Angina Prophylaxis:* The tablets are swallowed for protection against angina pectoris.

Dosage and administration *Angina Prophylaxis:* 1–2 Sorbid S.A. tablets should be swallowed twice daily.

Contra-indications, warnings, etc *Contra-indications:* A known sensitivity to the drug.

Warnings: The following adverse effects may be seen with isosorbide dinitrate.

1. Cutaneous vasodilation, headache, dizziness and weakness may occur. If headache is a problem, a temporary lowering of the Sorbid S.A. dose, and the use of analgesics, may be necessary. In the majority of patients, headache diminishes or disappears after 1–3 weeks and optimum dosage of Sorbid S.A. may be achieved.

2. Postural hypotension.

3. The drug can act as a physiological antagonist to noradrenaline, acetylcholine, histamine and other agents.

4. Dry rash and/or exfoliative dermatitis may occasionally occur.

Overdosage: Overdose should be treated symptomatically. The main symptom is likely to be hypotension and this may be treated by elevation of the legs to promote venous return.

Pharmaceutical precautions *Storage:* Although Sorbid S.A. tablets are very stable and no special storage precautions are required, it is advised that in accordance with good pharmaceutical practice the tablets should be stored protected from heat and moisture.

Legal category P.

Package quantities Sorbid S.A. 40 mg tablets are supplied in aluminium tubes of 60.

Further information Unlike glyceryl trinitrate, Sorbid S.A. tablets are very stable and therefore loss of potency when carried by the patient does not normally occur.

The duration of action of the Sorbid S.A. tablet is estimated to be up to 12 hours.

Product licence number

Sorbid S.A. tablets 40 mg 0029/0149

SORBITRATE*

Presentation Sorbitrate tablets contain isosorbide dinitrate. Sorbitrate tablets are available containing 10 mg and 20 mg isosorbide dinitrate. The 10 mg tablets are oval, yellow, scored tablets embossed Stuart. The 20 mg tablets are oval, blue, scored tablets embossed Stuart.

Uses *Angina Prophylaxis:* The tablets are taken orally for protection against angina pectoris.

Congestive Cardiac Failure: The tablets are taken as adjunctive therapy in the management of severe acute or chronic congestive cardiac failure.

Dosage and administration The tablets are scored for easier dose adjustment.

Angina Prophylaxis: 1–4 Sorbitrate 10 mg tablets or $\frac{1}{2}$ –Sorbitrate 20 mg tablets should be taken three or four times a day. The individual dose required for adequate cover should be determined.

Congestive Cardiac Failure: In severe congestive cardiac failure Sorbitrate tablets may be taken in doses of 10–40 mg three or four times daily depending on patient requirements. In this situation optimal individual dose is best determined by continuous haemodynamic monitoring. The use of Sorbitrate in severe congestive cardiac failure should be considered adjunctive therapy to more conventional treatment (e.g. digitalis, diuretics, etc.).

Contra-indications, warnings, etc

Contra-indications: A known sensitivity to the drug.

Warnings: The following adverse effects may be seen with isosorbide dinitrate.

1. Cutaneous vasodilation, headache, dizziness and weakness may occur. If headache is a problem, a temporary lowering of the Sorbitrate dose, and the use of analgesics, may be necessary. In the majority of patients, headache diminishes or disappears after 1–3 weeks and optimum dosage of Sorbitrate may be achieved.

2. Postural hypotension.

3. The drug can act as a physiological antagonist to noradrenaline, acetylcholine, histamine and other agents.

4. Dry rash and/or exfoliative dermatitis may occasionally occur.

Overdosage: Overdose should be treated symptomatically. The main symptom is likely to be hypotension and this may be treated by elevation of the patient's legs to promote venous return.

Pharmaceutical precautions *Storage:* Although Sorbitrate tablets are very stable and no special storage precautions are required, it is advised that in accordance with good pharmaceutical practice the tablets should be stored protected from heat and moisture.

Legal category P.

Package quantities Sorbitrate tablets: 20 mg tablets are supplied in aluminium tubes of 100.

10 mg tablets are supplied in aluminium tubes of 100 and 500.

Further information Unlike glyceryl trinitrate, Sorbitrate tablets are very stable and therefore loss of potency when carried by the patient does not normally occur. The duration of action of the tablets is estimated to be four to six hours.

Product licence numbers

STUART SILICONE PROTECTIVE

Presentation Stuart Silicone Protective presents Dimethyl Silicone Fluid BPC in a convenient aerosol form. It is presented in a printed tin-plate aerosol can which dispenses the product as a colourless liquid spray.

Uses Stuart Silicone Protective is a water repellent and brilliant preparation which provides surface protection of the skin against bed sores without the need to rub areas at risk in sensitive patients.

Dosage and administration The area to be protected could be cleaned and dried before spraying with Stuart Silicone Protective. Stuart Silicone Protective is applied by spraying for a few seconds from a distance of 4–8 cm (10–20 cm).

Contra-indications, warnings, etc Stuart Silicone Protective is for external use only and should not be used on broken, acutely inflamed or weeping skin, and must be kept away from the eyes and ears. Cases of infection should be treated symptomatically.

Pharmaceutical precautions Stuart Silicone Protective aerosols must be stored away from heat and must not be autoclaved. They must not be punctured or destroyed by burning, even when empty. Stuart Silicone Protective must be used directly from the aerosol.

Legal category GSL.

Package quantities Stuart Silicone Protective is supplied in aerosol cans of 200 g.

Further information Nil.

Product licence number 0029/5902.

STUART TINCT. BENZ. CO. SPRAY

Presentation Stuart Tinct. Benz. Co. Spray presents Compound Benzoin Tincture BPC in a convenient aerosol form. It is presented in a printed tin-plate aerosol can which dispenses the product as a tacky, dark brown resin with the distinct odour of gum benzoin. It contains 5% Compound Benzoin Tincture BPC.

Uses Stuart Tinct. Benz. Co. Spray has the local antiseptic, astringent and protective properties of Tinct. Benz. Co. It is used to reduce the sensitivity of skin to adhesive plaster, and to prevent skin irritation.

Dosage and administration Stuart Tinct. Benz. Co. Spray is applied by holding the aerosol can about 4–8 cm (10–20 cm) away from the area to be treated and spraying thinly.

Contra-indications, warnings, etc Although it has mild antiseptic properties, Stuart Tinct. Benz. Co. Spray must not be used on infected areas. It must not be used near the eyes or on broken skin.

Rare cases of contact dermatitis have been reported after topical use of Compound Benzoin Tincture BPC.

Cases of ingestion should be treated symptomatically.

Pharmaceutical precautions Stuart Tinct. Benz. Co. Aerosols must be stored away from heat and must not be autoclaved. The product should be used directly from the aerosol container. Containers must not be punctured or destroyed by burning even when empty.

Legal category GSL.

Package quantities Stuart Tinct. Benz. Co. Spray is presented as an aerosol spray the contents of which weigh 150 g.

Further information Nil.

Product licence number 0029/5904.

TENORETIC*

Presentation White film-coated tablets, imprinted with the lettering 'Tenoretic' and bisected on the reverse side. Each tablet contains 100 mg atenolol and 25 mg chlorthalidone.

Uses In mild and moderate hypertension.

Mode of action: Tenoretic combines the antihypertensive effects of the cardioselective beta-blocker atenolol and the diuretic chlorthalidone.

Dosage and administration One tablet daily.

Adults: Most patients with hypertension will give a satisfactory response to a single tablet daily of Tenoretic. There is little or no further fall in blood pressure with increased dosage, and where necessary another antihypertensive drug, such as a vasodilator, can be added. Patients can be transferred directly to Tenoretic from other antihypertensive treatments, with the exception of clonidine (see precautions below).

Children: There is no paediatric experience with Tenoretic; therefore this preparation is not recommended for children.

Contra-indications, warnings, etc

Contra-indications: Tenoretic should not be given to patients with second or third degree heart block. Beta-blockers should not be given with verapamil and neither drug should be administered within several days of discontinuing the other.

Precautions *Cardiac:* Untreated cardiac failure. Tenoretic should not be used in patients with untreated cardiac failure, but may be introduced when the failure has been controlled.

Pulse rate: One of the pharmacological actions of Tenoretic is to reduce the heart rate. In the rare instances that symptoms may be attributable to the slow heart rate, the dose may be reduced.

Sudden withdrawal in ischaemic heart disease: As with other beta-blockers, treatment in patients with ischaemic heart disease should not be discontinued abruptly.

Obstructive airways disease: Tenoretic contains the cardioselective beta-blocker atenolol and may therefore be used in patients with obstructive airways disease. However, an increase in airways resistance may be provoked in asthmatic patients. In contrast to preparations containing non-selective beta-blockers, this bronchospasm may usually be reversed by commonly used dosage of bronchodilator preparations such as salbutamol or isoprenaline.

Metabolic effects: The metabolic effects of chlorthalidone are dose-related and, at the low dose contained in the Tenoretic tablet, are unlikely to be troublesome.

Potassium Status: Tenoretic is associated with only minor changes in potassium status. Total body potassium is unaltered on chronic therapy, and changes in serum potassium are minor and probably clinically unimportant. Thus, in cases of uncomplicated hypertension, concurrent potassium supplements should be unnecessary. However, care should be taken with patients who are receiving digitalis preparations for cardiac failure, taking abnormal (low in potassium) diets, or suffering from gastro-intestinal complaints.

Serum Uric Acid: Tenoretic is generally associated with only a minor increase in serum uric acid. In cases of prolonged elevation the concurrent use of a uricosuric agent will reverse the hyperuricaemia.

Diabetes: Tenoretic contains chlorthalidone, which may decrease glucose tolerance. During prolonged therapy regular tests for glycosuria should be carried out.

Renal failure: In patients with severe renal impairment, a reduction in the daily dose or in frequency of administration may be necessary.

Anaesthesia: As with all beta-receptor blocking drugs it may be decided to withdraw Tenoretic before surgery. In this case 48 hours should be allowed to elapse between the last dose and anaesthesia. If treatment is continued care should be taken when using anaesthetic agents such as ether, cyclopropane and trichloroethylene. Vagal dominance, if it occurs, may be corrected with atropine (1–2 mg i.v.).

Concurrent clonidine therapy: If atenolol and clonidine are given concurrently, the clonidine should not be discontinued until several days after the withdrawal of the beta-blocker (see also manufacturer's prescribing information on clonidine).

Pregnancy: Like other drugs Tenoretic should not be given in pregnancy unless its use is essential.

Side-effects: Tenoretic is well tolerated. Side-effects associated with it are infrequent and generally mild. Cold extremities and transient muscle fatigue may occur, but the sleep disturbances which are associated with some other beta-blocking preparations are rare. There have been reports of skin rashes and/or dry eyes associated with the use of beta-adrenergic blocking drugs. The reported incidence is small and in most cases the symptoms have cleared when treatment was withdrawn. Discontinuance of the drug should be considered if any such reaction is not otherwise explicable. Cessation of therapy with a beta-blocker should be gradual. Nausea and dizziness have been reported occasionally with chlorthalidone, and idiosyncratic drug reactions such as thrombocytopenia and leucopenia have occurred rarely.

Overdosage: From first principles, excessive bradycardia may be countered by atropine, 1–2 mg intravenously, and, if necessary, this may be followed by a beta-stimulant, such as isoprenaline 25 micrograms initially, or orciprenaline 0.5 mg given as a slow intravenous injection. Care must be taken to ensure that the blood pressure does not fall too low if the dose of the beta-receptor agonist has to be increased. Excessive diuresis may be countered by maintaining normal fluid and electrolyte balance.

Pharmaceutical precautions Protect from heat, light and moisture.

Legal category POM.

Package quantities Calendar packs of 28 or 10 × 28 tablets.

Further information When the combined anti-hypertensive effect of a beta-blocker and a diuretic is required, Tenoretic is a simple, convenient and acceptable therapy which may be expected to improve patient compliance. The effect of Tenoretic following a single oral dose is sustained for at least twenty-four hours.

Product licence number 0029/0139

TENORET* 50 ▼

Presentation White film-coated tablets, imprinted with the lettering Tenoret 50 on one face. Each tablet

contains 50 mg atenolol and 12.5 mg chlorthalidone. The tablets are presented in calendar packs.

Uses Hypertension: Particularly suited to the older patient. The combination of low effective doses of beta-blocking drug and diuretic may be suited to older patients where full doses of both may be considered inappropriate.

Mode of Action: Tenoret 50 combines the antihypertensive effects of the cardioselective beta-blocker atenolol (Tenormin*) and the diuretic chlorthalidone.

Dosage and administration One tablet daily.

Adults: Older patients with hypertension who do not respond to low dose therapy with a single agent should have a satisfactory response to a single tablet daily of Tenoret 50. Where hypertensive control is not achieved addition of a small dose of a third agent, e.g. a vasodilator may be appropriate.

Contra-indications, warnings, etc Contra-indications: Tenoret 50 should not be given to patients with second- or third-degree heart block. Beta-blockers should not be given with verapamil and neither drug should be administered within several days of discontinuing the other.

Precautions Cardiac: Untreated cardiac failure. Tenoret 50 should not be used in patients with untreated cardiac failure, but may be introduced when the failure has been controlled.

Pulse rate: One of the pharmacological actions of Tenoret 50 is to reduce heart rate. In the rare instances that symptoms may be attributable to the slow heart rate the dose may be reduced.

Sudden withdrawal in ischaemic heart disease: As with other beta-blockers, treatment in patients with ischaemic heart disease should not be discontinued abruptly.

Obstructive airways disease: Tenoret 50 contains the cardioselective beta-blocker atenolol and may therefore be used with caution in patients with obstructive airways disease. However, an increase in airways resistance may be provoked in asthmatic patients. In contrast to preparations containing non-selective beta-blockers, this bronchospasm may usually be reversed by a commonly used dosage of bronchodilator preparations such as salbutamol or isoprenaline.

Metabolic effects: The metabolic effects of chlorthalidone are dose-related and, at the low dose contained in the Tenoret 50 tablet, are most unlikely to be troublesome.

Potassium status: Experience even with a full dose of this beta-blocker and diuretic combination in Tenoretic has been associated with only minor changes in potassium status. Total body potassium is unaltered on chronic therapy, and changes in serum potassium are minor and probably clinically unimportant. Thus, in cases of uncomplicated hypertension, concurrent potassium supplements should be unnecessary. However, in the older patient who may be receiving digitalis preparations for cardiac failure, taking an abnormal (low in potassium) diet or suffering from gastrointestinal complaints, occasional measurement of potassium levels is appropriate.

Serum uric acid: Experience, again with Tenoretic, has generally been associated with only a minor increase in serum uric acid. In cases of prolonged elevation the concurrent use of a uricosuric agent will reverse the hyperuricaemia.

Diabetes: Tenoret 50 contains chlorthalidone which may

decrease glucose tolerance. During prolonged therapy regular tests for glycosuria should be carried out.

Renal impairment: In patients with severe renal impairment a reduction in the frequency of administration may be necessary.

anaesthesia: As with all beta-receptor blocking drugs it may be decided to withdraw Tenoret 50 before surgery. In this case 48 hours should be allowed to elapse between the last dose and anaesthesia. If treatment is continued care should be taken when using anaesthetic agents such as ether, cyclopropane and trichloroethylene. Vagal dominance, if it occurs, may be corrected with atropine (1–2 mg i.v.).

Concurrent clonidine therapy: If atenolol and clonidine are given concurrently, the clonidine should not be discontinued until several days after the withdrawal of the beta-blocker (see also manufacturers prescribing information on clonidine).

Fertility: Like other drugs, Tenoret 50 should not be given in pregnancy unless its use is essential.

Side effects: Cold extremities and transient muscle fatigue may occur, but the sleep disturbances which are associated with some other beta-blocking preparations are rare. There have been reports of skin rashes and/or dry eyes associated with the use of beta-adrenergic blocking drugs. The reported incidence is small and in most cases the symptoms have cleared when treatment was withdrawn. Discontinuance of the drug should be considered if any such reaction is not otherwise explicable. Nausea and dizziness have been reported occasionally with chlorthalidone, and idiosyncratic drug reactions such as thrombocytopenia and leucopenia have occurred rarely.

Overdosage: From first principles, excessive bradycardia may be countered by atropine, 1–2 mg intravenously, and, if necessary, this may be followed by a beta-stimulant, such as isoprenaline 25 micrograms initially, or orciprenaline 0.5 mg, given as a slow intravenous injection. Care must be taken to ensure that the blood pressure does not fall too low if the dose of the beta-receptor agonist has to be increased. Excessive diuresis may be countered by maintaining normal fluid and electrolyte balance.

Pharmaceutical precautions Protect from heat, light and moisture.

Legal category POM.

Package quantities Calendar packs, each containing 28 tablets.

Further information When the combined anti-hypertensive effect of a beta-blocker and a diuretic is required, Tenoret 50 one tablet daily is a simple, convenient and acceptable therapy which may be expected to improve patient compliance.

Product licence number 0029/0156

TENORMIN* TABLETS

Presentation Tenormin tablets containing atenolol 100 mg are round, bi-convex, orange and film coated. They are imprinted on one face with the name Tenormin and are bisected on the reverse face.

Uses Management of hypertension, angina pectoris and dysrhythmias.

Mode of action: Tenormin (atenolol) is a beta-adrenoceptor blocking drug which is cardioselective (i.e. acts preferentially on beta-adrenergic receptors in the heart). It is without intrinsic sympathomimetic and membrane stabilising activities. It is probably the action of Tenormin in reducing cardiac rate and contractility which makes it effective in eliminating or reducing the symptoms of patients with angina. As with other beta-adrenoceptor blocking drugs its mode of action in the treatment of hypertension is unclear. It is effective as a beta adrenoceptor blocking drug on the heart for at least 24 hours following a single oral dose. Human studies indicate that it crosses the blood brain barrier only to a negligible extent.

Dosage and administration Adults:

Hypertension: One tablet daily. Most patients respond to 100 mg daily given as a single dose. The effect will be fully established after one to two weeks. A further reduction in blood pressure may be achieved by combining Tenormin with other antihypertensive agents. For example, co-administration of Tenormin with a diuretic, as in Tenoretic, provides a highly effective and convenient antihypertensive therapy.

Patients can be transferred to Tenormin from other antihypertensive treatments with the exception of clonidine (see precautions below).

Angina: Most patients with angina pectoris will respond to 100 mg daily given as a single or divided dose. It is unlikely that additional benefit will be gained by increasing the dose.

Dysrhythmias: Having controlled the dysrhythmias with intravenous Tenormin (see entry for Tenormin Injection) a suitable oral maintenance dosage is 50–100 mg daily.

Children: There is no paediatric experience with Tenormin and for this reason it is not recommended for children.

Contra-indications, warnings, etc

Contra-indications: Tenormin is contra-indicated in patients with second-degree or third-degree heart block. Beta-blockers should not be given with verapamil and neither drug should be administered within several days of discontinuing the other.

Precautions: Tenormin must not be used in patients with untreated cardiac failure, but may be introduced with care when the failure has been brought under control. Where congestive cardiac failure appears during treatment with Tenormin, the drug may be temporarily withdrawn until the failure has been controlled.

One of the pharmacological actions of Tenormin is to reduce heart rate. In the rare instances that symptoms may be attributable to the slow heart rate, the dose may be reduced.

Tenormin acts preferentially on cardiac beta-receptors. It can be used in patients with chronic obstructive airways disease. However, an increase in airways resistance may be provoked in asthmatic patients. In contrast to non-selective beta-blockers this bronchospasm may usually be reversed by commonly used dosage of broncho-dilator preparations such as salbutamol or isoprenaline.

In patients suffering from ischaemic heart disease, as with other beta-blocking agents, treatment should not be discontinued abruptly.

If Tenormin and clonidine are given concurrently the clonidine should not be discontinued until several days

after the withdrawal of the beta-blocker (see also prescribing information on clonidine).

Anaesthesia: As with all beta receptor blocking drugs it may be decided to withdraw Tenormin before surgery. In this case 48 hours should be allowed to elapse between the last dose and anaesthesia. If treatment is continued care should be taken when using anaesthetic agents such as ether, cyclopropane and trichloroethylene. Vagal dominance, if it occurs, may be corrected with atropine (1–2 mg i.v.).

Renal failure: Since Tenormin is excreted via the kidneys dosage should be adjusted in cases of severe impairment of renal function. No significant accumulation of Tenormin occurs at a GFR greater than 35 ml/min/1.73 m² (normal range is 100–150 ml/min/1.73 m²). For patients with a creatinine clearance of 15–35 ml/min/1.73 m² (equivalent to serum creatinine of 300–600 mcmol/litre) the dose should be 50 mg daily or 100 mg on alternate days. For patients with a creatinine clearance of < 15 ml/min/1.73 m² (equivalent to serum creatinine of 600 mcmol/litre) the dose should be 50 mg on alternate days or 100 mg every fourth day.

Patients on haemodialysis should be given 50 mg after each dialysis; this should be done under hospital supervision as marked falls in blood pressure can occur.

Pregnancy: Like all other drugs, Tenormin should not be given in pregnancy unless its use is essential. There is no evidence of teratogenicity in animal studies.

Side-effects: In clinical studies the side-effects reported are usually attributable to its pharmacological actions and include coldness of the extremities, muscular fatigue and, in isolated cases, bradycardia. Sleep disturbances of the type noted with other beta-blockers have rarely been reported. There have been reports of skin rashes and/or dry eyes associated with the use of beta adrenergic blocking drugs. The reported incidence is small and in most cases the symptoms have cleared when treatment was withdrawn. Discontinuance of the drug should be considered if any such reaction is not otherwise explicable. Cessation of therapy with a beta-blocker should be gradual.

Overdosage: From first principles, excessive bradycardia may be countered by atropine, 1–2 mg intravenously, and, if necessary, this may be followed by a beta stimulant, such as isoprenaline 25 micrograms initially or orciprenaline 0.5 mg given as a slow intravenous injection. Care must be taken to ensure that the blood pressure does not fall too low if the dose of the beta-receptor agonist has to be increased.

Pharmaceutical precautions Tenormin tablets should be protected from heat, light and moisture.

Legal category POM.

Package quantities 100 mg tablets in calendar packs of 28 or 10 × 28.

Further information Tenormin facilitates compliance with antihypertensive therapy by its acceptability to patients and simplicity of dosing. The narrow dose range and early patient response ensure that the effect of the drug in individual patients is quickly demonstrated. Tenormin is fully compatible with diuretics and other hypotensive agents. Since it acts preferentially on beta receptors in the heart, Tenormin may, with care, be used successfully in the treatment of patients with respiratory disease who cannot tolerate non-selective beta-blockers.

Product licence number 0029/0122.

TENORMIN* INJECTION ▼

Presentation Tenormin Injection containing 5 mg atenolol in 10 ml isotonic, citrate buffered aqueous solution.

Uses Management of dysrhythmias.

Mode of action: Tenormin (atenolol) is a beta-adrenoceptor blocking drug which is cardioselective (i.e. act preferentially on beta-adrenergic receptors in the heart). It is without intrinsic sympathomimetic and membranestabilising activities. Human studies indicate that it crosses the blood-brain barrier only to a negligible extent.

Dosage and administration *Adults: Dysrhythmias* A suitable initial dose of Tenormin is 2.5 mg (5 ml injected intravenously over a 2.5 minute period (i.e. 1 mg/minute). This may be repeated at 5 minute interval until a response is observed up to a maximum dosage of 10 mg. If Tenormin is given by infusion, 0.15 mg/kg body weight may be administered over a 20 minute period. If required, the injection or infusion may be repeated every 12 hours. Having controlled the dysrhythmias with intravenous Tenormin a suitable oral maintenance dosage is 50–100 mg daily (see entry for Tenormin Tablets).

Children: There is no paediatric experience with Tenormin and for this reason it is not recommended for children.

Contra-indications, warnings, etc Tenormin is contra-indicated in patients with second-degree or third-degree heart block. Beta-blockers should not be given with verapamil and neither drug should be administered within several days of discontinuing the other.

Precautions: Tenormin must not be used in patients with untreated cardiac failure, but may be introduced with care when the failure has been brought under control. Where congestive cardiac failure appears during treatment with Tenormin, the drug may be temporarily withdrawn until the failure has been controlled.

One of the pharmacological actions of Tenormin is to reduce heart rate. In the rare instances that symptoms may be attributable to the slow heart rate, the dose may be reduced.

Tenormin acts preferentially on cardiac beta-receptors. It can be used in patients with chronic obstructive airways disease. However, an increase in airways resistance may be provoked in asthmatic patients. In contrast to non-selective beta-blockers this bronchospasm may usually be reversed by commonly used dosage of bronchodilator preparations such as salbutamol or isoprenaline.

In patients suffering from ischaemic heart disease, as with other beta-blocking agents, treatment should not be discontinued abruptly. If Tenormin and clonidine are given concurrently the clonidine should not be discontinued until several days after the withdrawal of the beta-blocker (see also 'Prescribing Information' on clonidine).

Anaesthesia: As with all beta-receptor blocking drugs it may be decided to withdraw Tenormin before surgery. In this case 48 hours should be allowed to elapse between the last dose and anaesthesia. If treatment is continued care should be taken when using anaesthetic agents such as ether, cyclopropane and trichloroethylene. Vagal dominance, if it occurs, may be corrected with atropine (1–2 mg i.v.).

Renal failure: Since Tenormin is excreted via the kidneys dosage should be adjusted in cases of severe impairment

renal function. No significant accumulation of Tenormin occurs at a GFR greater than 35 ml/min/1.73 m² (normal range is 100–150 ml/min/1.73 m²). For patients with a creatinine clearance of 15–35 ml/min/1.73 m² (equivalent to serum creatinine of 300–600 µmol/litre) the oral dose should be 50 mg daily or 100 mg on alternate days. For patients with a creatinine clearance < 15 ml/min/1.73 m² (equivalent to serum creatinine > 600 µmol/litre) the oral dose should be 50 mg on alternate days or 100 mg every fourth day.

Patients on haemodialysis should be given 50 mg orally after each dialysis; this should be done under hospital supervision as marked falls in blood pressure can occur.

regnancy: Like all other drugs, Tenormin should not be given in pregnancy unless its use is essential. There is no evidence of teratogenicity in animal studies.

side effects: In clinical studies, the side effects reported are usually attributable to its pharmacological actions and include coldness of the extremities, muscular fatigue and, in isolated cases, bradycardia. Sleep disturbances of the type noted with other beta-blockers have rarely been reported.

There have been reports of skin rashes and/or dry eyes associated with the use of beta-adrenergic blocking drugs. The reported incidence is small and in most cases the symptoms have cleared when treatment was withdrawn. Discontinuance of the drug should be considered any such reaction is not otherwise explicable. Cessation of therapy with a beta-blocker should be gradual.

overdose: From first principles, excessive bradycardia may be countered by atropine, 1–2 mg intravenously, and, if necessary, this may be followed by a beta stimulant, such as isoprenaline 25 micrograms initially, or orciprenaline 0.5 mg given as a slow intravenous injection. Care must be taken to ensure that the blood pressure does not fall too low if the dose of the beta-receptor agonist has to be increased.

pharmaceutical precautions Tenormin Injection should be protected from light.

note: Dilutions of Tenormin Injection in Dextrose Injection BP, Sodium Chloride Injection BP or Sodium Chloride and Dextrose Injection BP may be used.

legal category POM.

package quantities Injection: 10 ml ampoules in boxes of 10.

further information Since it acts preferentially on beta-receptors in the heart, Tenormin may, with care, be used successfully in the treatment of patients with respiratory disease who cannot tolerate non-selective beta-blockers.

product licence number 0029/0087

TENORMIN[®] LS

presentation Tenormin LS tablets, containing atenolol 50 mg are round, bi-convex, white and film coated. They are imprinted on one face with the name Tenormin 50.

uses Management of hypertension, angina pectoris and dysrhythmias in patients with impaired renal function.

mode of action: Tenormin LS (atenolol) is a beta-adrenoceptor blocking drug which is cardioselective (i.e.

acts preferentially on beta adrenergic receptors in the heart). It is without intrinsic sympathomimetic and membrane stabilising activities. It is probably the action of Tenormin LS in reducing cardiac rate and contractility which makes it effective in eliminating or reducing the symptoms of patients with angina. As with other beta-adrenoceptor blocking drugs, its mode of action in the treatment of hypertension is unclear. It is effective as a beta-adrenoceptor blocking drug on the heart for at least 24 hours following a single oral dose. Human studies indicate that it crosses the blood brain barrier only to a negligible extent.

Dosage and administration *Adults:* In patients having normal renal function the doses of Tenormin recommended are:

<i>Hypertension:</i>	100 mg once daily
<i>Angina Pectoris:</i>	100 mg daily in single or divided doses
<i>Dysrhythmias:</i>	50–100 mg daily

Patients with impaired renal function, as defined below will respond to 50 mg of atenolol taken daily or on alternate days.

<i>Glomerular Filtration Rate (ml/min/1.73 m²)</i>	<i>Atenolol Dose (mg)</i>
35 or more	100 daily
15–35	50 daily
less than 15	50 on alternate days

Patients on haemodialysis should be given 50 mg after each dialysis; this should be done under hospital supervision as marked falls in blood pressure can occur.

The effect of Tenormin LS therapy will be fully established after one–two weeks.

Unlike many other beta-adrenoceptor blocking drugs, atenolol is metabolised to only a slight extent (10%). There is no first pass effect due to extensive hepatic metabolism, and no accumulation of metabolites of unknown pharmacological activity. It is, therefore, possible to adjust the dosage in patients with renal disease in proportion to the degree of renal impairment, without the need to determine optimum dose by titration for each patient.

Patients can be directly transferred to Tenormin LS from other antihypertensive treatments with the exception of clonidine (see precautions below).

Children: There is no paediatric experience with Tenormin LS, and for this reason it is not recommended for children.

Contra-indications, warnings, etc

Contra-indications: Tenormin LS is contra-indicated in patients with second-degree or third-degree heart block. Beta blockers should not be given with verapamil, and neither drug should be administered within several days of discontinuing the other.

Precautions: Tenormin LS must not be used in patients with untreated cardiac failure, but may be introduced with care when the failure has been brought under control. Where congestive cardiac failure appears during treatment with Tenormin LS the drug may be temporarily withdrawn until the failure has been controlled.

One of the pharmacological actions of atenolol is to reduce heart rate. In the rare instances that symptoms may be attributable to the bradycardia, the dose may be reduced by giving a tablet of Tenormin LS on alternate days.

Tenormin LS acts preferentially on cardiac beta receptors. It can be used in patients with chronic obstructive airways disease. However, an increase in airways resistance may be provoked in asthmatic patients. In contrast to non-selective beta blockers, this bronchospasm may usually be reversed by commonly used doses of broncho-dilator preparations such as salbutamol or isoprenaline.

In patients suffering from ischaemic heart disease, as with other beta blocking agents, treatment should not be discontinued abruptly.

If Tenormin LS and clonidine are given concurrently, the clonidine should not be discontinued until several days after the withdrawal of the beta blocker (see also prescribing information on clonidine).

Anaesthesia: As with all beta receptor blocking drugs, it may be decided to withdraw Tenormin LS before surgery. In this case, 48 hours should be allowed to elapse between the last dose and anaesthesia. If treatment is continued, care should be taken when using anaesthetic agents such as ether, cyclopropane, and trichloroethylene. Vagal dominance, if it occurs, may be corrected with atropine (1–2 mg i.v.).

Pregnancy: Like all other drugs, Tenormin LS should not be given in pregnancy unless its use is essential. There is no evidence of teratogenicity in animal studies.

Side-effects: In clinical studies, the side effects reported are usually attributable to its pharmacological actions and include coldness of the extremities, muscular fatigue, and in isolated cases bradycardia. Sleep disturbances of the type noted with other beta blockers have rarely been reported.

There have been reports of skin rashes and/or dry eyes associated with the use of beta adrenergic blocking drugs. The reported incidence is small and in most cases

the symptoms have cleared when treatment was withdrawn. Discontinuance of the drug should be considered if any such reaction is not otherwise explicable. Cessation of therapy with a beta blocker should be gradual.

Overdosage: From first principles, excessive bradycardia may be countered by atropine, 1–2 mg, intravenous and if necessary this may be followed by a beta stimulant such as isoprenaline 25 micrograms initially, or orciprenaline 0.5 mg given as a slow intravenous injection. Care must be taken to ensure that the blood pressure does not fall too low if the dose of the beta receptor agonist has to be increased.

Pharmaceutical precautions Tenormin LS tablets should be protected from heat, light, and moisture.

Legal category POM.

Package quantities 50 mg tablets in tubes of 100.

Further information Tenormin LS facilitates compliance with anti-hypertensive therapy by its acceptability to patients and simplicity of dosing. The narrow dose range and early patient response ensure that the effect of the drug in individual patients is quickly demonstrated. Tenormin LS is fully compatible with diuretics and other hypotensive agents. Since it acts preferentially on beta receptors in the heart, Tenormin LS may, with care, be used successfully in the treatment of patients with respiratory disease who cannot tolerate non-selective beta blockers.

ANAPOLON* 5

Presentation Each Anapolon Tablet contains oxymetholone 5 mg. The white tablets are marked ANAPOLON on one face and SYNTEX on the other.

Uses Anapolon Tablets are recommended for conditions in which a potent tissue-building or protein-sparing action is desired, such as convalescence after severely debilitating diseases, surgical cases, osteoporosis, pituitary dwarfism, following corticosteroid therapy and after burns.

Dosage and administration Hormone therapy is adjunctive to and not a replacement for conventional therapy. Duration of therapy will depend on the response to the condition and the appearance of adverse reactions. Therapy should be intermittent. Adequate amounts of calories and protein must be given if a beneficial effect is to be obtained.

Adults: The recommended dosage is 1 to 2 tablets per day (5–10 mg) for four to six weeks, with breaks of 10–15 days between each course.

Children: In children up to 12 years of age, adequate response has been observed on doses of $\frac{1}{2}$ to 1 tablet per day (2.5–5 mg). Four to six weeks of therapy should be followed by one month without therapy. X-rays should often be taken to determine the amount of bone maturation. As skeletal stimulation may continue for six months after therapy has been stopped, the drug should be discontinued well before bone maturation reaches the norm for the chronological age.

Contra-indications, warnings, etc

Contra-indications: Carcinoma of the prostate or breast in male patients; pregnancy (primarily because of masculinisation of the foetus); infancy; nephrosis or the ephrotic phase of nephritis; hepatic dysfunction; hypersensitivity to oxymetholone.

Warnings and precautions: Oxymetholone should not be used to promote weight gain in adults or children who are healthy. Oxymetholone should not be used to enhance athletic ability.

Tumours of the liver have been reported occasionally in patients subjected to prolonged treatment with anabolic steroids. The possibility that these compounds may induce or enhance the development of hepatic tumours cannot at present be excluded and this should be considered when the use of the product is proposed, especially in young people who are not suffering from life-threatening disorders.

Caution is required when administering anabolic steroids to patients with cardiac, renal or hepatic disease or with benign prostatic hypertrophy. Oedema may occur occasionally.

Anabolic steroids may increase sensitivity to anticoagulants. Dosage of the anticoagulant may have to be decreased to maintain the prothrombin time at the desired therapeutic level.

Anabolic steroids have been shown to alter glucose

tolerance tests. Diabetics should be followed carefully and the dosage of insulin or oral hypoglycaemic agents adjusted accordingly.

Disturbance of liver function tests, elevation of serum bilirubin and jaundice may occur. Liver function should be checked at regular intervals in patients receiving Anapolon Tablets. The following adverse reactions may occur:

1. *In males:* Pre-pubertal phallic enlargement and increased frequency of erections; post-pubertal inhibition of testicular function and oligospermia and gynaecomastia.
2. *In females:* Hirsutism, male-pattern baldness, deepening of the voice and clitoral enlargement (these changes are usually irreversible even after prompt discontinuation of therapy); menstrual irregularities.
3. *In both sexes:* Increased or decreased libido; acne (especially in females and pre-pubertal males); premature closure of the epiphyses in children.

Pharmaceutical precautions Anapolon Tablets should be kept under normal storage conditions.

Legal category POM.

Package quantities Anapolon Tablets are available in canisters of 100 tablets.

Further information A higher-strength presentation, Anapolon 50 Tablets, is specifically indicated in aplastic and refractory hypoplastic anaemias. Full prescribing information should be consulted for that presentation if it is to be used.

Product licence number 0286/5008.

ANAPOLON* 50

Presentation Each Anapolon 50 Tablet contains oxymetholone 50 mg. The white tablets are scored and stamped with the number '50' on one side and SYNTEX on the other.

Uses Anapolon 50 is recommended for the treatment of aplastic and refractory anaemias (including acquired, idiopathic and congenital aplasias). Anapolon 50 is also recommended as adjunctive therapy in patients with malignant diseases where treatment with cytotoxic agents or radiotherapy is likely to cause bone-marrow depression.

The exact mode of action of oxymetholone is as yet uncertain. It is thought, however, that oxymetholone stimulates the production of erythropoietin, which in turn acts on the primitive stem cells increasing the rate of differentiation into red cell precursors. It has also been demonstrated that oxymetholone increases the mitotic rate of the stem cells, stimulating the extension of healthy tissue into hypoplastic areas of the bone marrow. Oxymetholone has a beneficial effect on haemoglobin

synthesis as shown by an increased plasma iron clearance.

Dosage and administration The recommended dosage when treating aplasias is from 2 mg to 5 mg per kg body weight daily for adults, and from 2 mg to 4 mg per kg body weight daily for children in divided doses. The selected dose will depend on the severity of the condition.

1. Initial therapy should be continued for a period of six months or until a response is seen (whichever is the shorter time). Therapy must be maintained for at least three months before a response can be expected.

2. From the time of response the same dose should be continued for a further three months.

3. At this time the dose should be halved and, if the remission is maintained, continued for three months.

4. During the next three months gradual withdrawal should be attempted.

5. Should a relapse occur at any time whilst the dose is being reduced the initial dosage regime should be re-instituted. When administering oxymetholone as an adjunctive to cytotoxic therapy and radiotherapy the recommended dosage is up to 150 mg per day.

Contra-indications, warnings, etc

Contra-indications: Carcinoma of the prostate or breast in male patients; pregnancy (primarily because of masculinisation of the foetus); infancy; nephrosis or the nephrotic phase of nephritis; hepatic dysfunction; hypersensitivity to oxymetholone.

Precautions and warnings: Tumours of the liver have been reported occasionally in patients subjected to prolonged treatment with androgenic-anabolic steroids. The possibility that these compounds may induce or enhance the development of hepatic tumours cannot at present be excluded and this should be considered when the use of this product is proposed, especially in young people who are not suffering from life-threatening disorders.

Care should be exercised in incipient cardiac failure and the elderly male in whom benign enlargement of the prostate is evident. When anticoagulant therapy is used concomitantly, dosage of the anticoagulant may have to be decreased in order to maintain the prothrombin time at the desired therapeutic level. This is because Anapolon, like other anabolic steroids, may enhance blood fibrinolytic activity.

Oxymetholone exhibits only slight androgenic activity in low doses, but in the high dosage levels employed in the treatment of aplastic anaemias, it may lead to virilisation in women and pre-pubertal children. Disturbance of liver function tests, elevation of serum bilirubin and jaundice may occur, together with other signs of liver disturbance. Should this happen, the dosage should be halved. If liver function tests do not improve within one week then oxymetholone therapy should be withdrawn. Peliosis hepatis and hepatocellular carcinoma have occasionally been observed in patients with congenital and acquired aplastic anaemia treated with oxymetholone and other oral androgens for prolonged periods. In some cases withdrawal of the drug has been associated with regressions of the hepatic lesions.

With prolonged high dosage any sodium retention that may occur is usually responsive to diuretic therapy.

Leukaemia has been observed in patients with aplastic anaemia treated with oxymetholone. The role, if any, of oxymetholone is unclear since malignant transformation has been seen in blood dyscrasias and leukaemia has

been reported in patients with aplastic anaemia who have not been treated with oxymetholone.

The following adverse reactions may occur:

1. *In males:* Pre-pubertal phallic enlargement or erections; post-pubertal inhibition of testicular function an oligospermia and gynaecomastia.

2. *In females:* Hirsutism, male-pattern baldness, deepening of the voice and clitoral enlargement (these changes are usually irreversible even after prompt discontinuation of therapy); menstrual irregularities.

3. *In both sexes:* Increased or decreased libido; acne (especially in females and pre-pubertal males); premature closure of the epiphyses in children.

Pharmaceutical precautions Anapolon 50 should be kept under normal storage conditions.

Legal category POM.

Package quantities Anapolon 50 is available in canisters of 100 tablets.

Further information A lower-strength preparation (Anapolon 5 Tablets, oxymetholone 5 mg), is specifically indicated for conditions where tissue-building or protein sparing action is desired. Full prescribing information should be consulted for that presentation if it is to be used.

Product licence number 0286/5009.

BREVINOR®

Presentation A 21-tablet calendar pack: each white tablet contains norethisterone 0.5 mg (500 mcg) and ethinyloestradiol 35 mcg. The tablets are marked B on one side.

Uses Brevinor is indicated for oral contraception, with the benefit of a low intake of oestrogen.

The mode of action of Brevinor is similar to that of other progestogen/oestrogen oral contraceptives; its activity is exerted through a combined effect on one or more of the following: hypothalamus, anterior pituitary ovary, endometrium and cervical mucus.

Dosage and administration The dosage of Brevinor for the initial cycle of therapy is 1 tablet taken daily from the 5th to the 25th day of the menstrual cycle, counting the first day of menstrual flow as 'Day 1'. For the subsequent cycles, no tablets are taken for seven days; then a new course is started of 1 tablet daily for 21 days. This sequence of 21 days on treatment, seven days off treatment is repeated for as long as contraception is required.

To provide added protection during the first cycle only the patient should be instructed to use an additional method of contraception for the first 14 days.

Tablet omissions: Tablets must be taken daily in order to maintain adequate hormone levels. If a tablet is missed it should be taken as soon as possible, within 24 hours of the correct time even if this means that 2 tablets are taken together. If 2 tablets are missed, a tablet should be taken as soon as possible so medication is re-established. An additional method of contraception should be used for the remainder of that tablet cycle. If more than 2 tablets have been missed, oral contraceptive therapy should be discontinued immediately and a method of non-hormonal contraception should be used until menstruation has appeared or pregnancy has been excluded.

Switching from another oral contraceptive: Brevinor could be started seven days after completing the last course of the other product. An additional mechanical or chemical contraceptive should be used for the first 14 days of tablet-taking.

Use after childbirth, miscarriage or abortion: After childbirth, oral contraception is usually started when spontaneous menstruation has resumed. Another method of contraception should be used in the meantime, unless the first course of tablets is started within seven days of delivery. After a miscarriage or abortion, oral contraception can normally be started on the fifth day.

Contra-indications, warnings, etc

Contra-indications: As with all combined progestogen/oestrogen oral contraceptives, the following conditions should be regarded as contra-indications:

-) Thrombophlebitis, thromboembolic disorders, cerebral apoplexy, or a history of these conditions.
-) Acute or severe chronic liver disease, Dubin-Johnson or Rotor syndrome, history during pregnancy of idiopathic jaundice or severe pruritus.
-) Known or suspected carcinoma of the breast.
-) Known or suspected oestrogen-dependent neoplasia.
-) Undiagnosed abnormal vaginal bleeding.
-) Pregnancy.

Side-effects and precautions: As with all oral contraceptives, there may be slight nausea at first, weight gain or breast discomfort, which soon disappear.

Spotting or bleeding may occur during the first few cycles. Usually menstrual bleeding becomes light and occasionally there may be no bleeding during the tablet-free days.

Hypertension, which is usually reversible on discontinuing treatment, has occurred in a small percentage of women taking oral contraceptives. Oestrogen-progestogen preparations should be used with caution in patients with a history of hepatic dysfunction or hypertension.

A statistical association between the use of oral contraceptives and the occurrence of thrombosis, embolism or haemorrhage has been reported. Patients on such treatments should be kept under regular surveillance, in view of the possibility of development of such conditions as thromboembolism.

Risk of coronary artery disease in women taking oral contraceptives is increased by the presence of other predisposing factors such as cigarette smoking, hypercholesterolaemia, obesity, diabetes, history of pre-lamptic toxemia and increasing age. After the age of forty-five years, the patient and physician should carefully re-assess the risk/benefit ratio of using combined oral contraceptives as opposed to alternative methods of contraception.

Benign and malignant liver tumours have been associated with oral contraceptive use. The relationship between occurrence of liver tumours and use of female sex hormones is not known at present. These tumours are very rare but they may rupture causing intra-abdominal bleeding. If the patient presents with a mass tenderness in the right upper quadrant or an acute abdomen, the possible presence of a tumour should be considered.

The use of this product in patients suffering from epilepsy, migraine, asthma or cardiac dysfunction may result in exacerbation of these disorders, because of fluid retention.

A decreased glucose tolerance may occur in diabetic patients on this treatment, and their control must be carefully supervised.

An increased risk of congenital anomalies, including heart defects and limb defects, has been reported following the use of sex hormones, including oral contraceptives, in pregnancy. If the patient does not adhere to the prescribed schedule, the possibility of pregnancy should be considered at the time of the first missed period and further use of oral contraceptives should be withheld until pregnancy has been ruled out. It is recommended that for any patient who has missed two consecutive periods, pregnancy should be ruled out before continuing the contraceptive regimen. If pregnancy is confirmed the patient should be apprised of the potential risks to the foetus and the advisability of continuing the pregnancy should be discussed in the light of these risks. It is advisable to discontinue Brevinor three months before a planned pregnancy.

Gastro-intestinal upsets may interfere with the absorption of the tablets. Some drugs may modify the metabolism of Brevinor reducing its effectiveness; these include certain sedatives, antibiotics, anti-epileptic and anti-arthritis drugs. During the time such agents are used concurrently, it is advisable that mechanical contraceptives also be used.

Women taking oral contraceptives require careful observation if they have or have had any of the following conditions: breast nodules; fibrocystic disease of the breast or an abnormal mammogram; a history of severe depressive states; varicose veins; sickle-cell anaemia; diabetes; hypertension; high blood cholesterol levels; epilepsy; asthma; otosclerosis; multiple sclerosis; porphyria; tetany; disturbed liver functions; gallstones; cardiovascular disease; kidney disease; chloasma; herpes of pregnancy. The worsening or first appearance of any of these conditions may indicate that the oral contraceptive should be stopped. Contact lenses may become uncomfortable.

Brevinor should be discontinued at least six weeks before elective operations and during immobilisation.

Women with a history of oligomenorrhoea or secondary amenorrhoea or young women without regular cycles may have a tendency to remain anovulatory or to become amenorrhoeic after discontinuation of oral contraceptives. Women with these pre-existing problems should be advised of this possibility and encouraged to use other contraceptive methods.

The risk of arterial thrombosis associated with combined oral contraceptives increases with age, and this risk is aggravated by cigarette smoking. The use of combined oral contraceptives by women in the older age group, especially those who are cigarette smokers, should therefore be discouraged and alternative methods advised.

Treatment of overdose: Overdosage may be manifested by nausea, vomiting, breast enlargement and vaginal bleeding. There is no specific antidote and treatment should be symptomatic. Gastric lavage may be employed if the overdose is large and the patient is seen sufficiently early (within four hours).

Pharmaceutical precautions Brevinor should be kept under normal storage conditions.

Legal category POM.

Package quantities Brevinor is available in calendar packs of 3 x 21 tablets.

Further information Nil.

Product licence number 0286/0054.

EMKO* CONTRACEPTIVE FOAM

Presentation A pressurised metal canister which delivers into the applicator provided a foam containing nonoxynol-9 8% w/v and benzethonium chloride 0.2% w/v.

Uses Spermicidal contraceptive agent. As with other spermicidal preparations, an additional method of contraception, for example, diaphragm, cap or intra-uterine device, must be used with Emko Foam.

When pregnancy is medically contra-indicated, the choice of contraceptive should be made in consultation with a doctor.

Dosage and administration The contents of the applicator to be introduced into the vagina not more than one hour before intercourse. Emko Foam must be used each time physical contact is repeated.

If a diaphragm or cap is used, Emko Foam may be used as a lubricant, spread around the rim.

Contra-indications, warnings, etc There are no known contra-indications to the use of Emko Contraceptive Foam.

On rare occasions irritation of the vagina or penis may occur; if it does, use of Emko should be discontinued and medical advice should be sought.

Douching is unnecessary; following sexual intercourse, an interval of at least six hours must elapse before douching for cleansing purposes.

Pharmaceutical precautions Store in a cool place.

Legal category GSL.

Package quantities Emko Contraceptive Foam Kit containing 40 g aerosol container and an applicator.

40 g refill aerosol pack.

90 g refill aerosol pack.

Further information In one study (1), Emko Contraceptive Foam was used by 2,932 women for 28,322 cycles; a pregnancy-rate of 3.98 pregnancies per 100 woman-years was reported. Another study (2), in 130 women who used Emko Contraceptive Foam for 2,737 women-months, showed a pregnancy-rate of 1.75 pregnancies per 100 woman-years. Both study reports emphasised the need for giving adequate, careful instructions to the patients.

MASTERIL*

Presentation Each Masteril ampoule contains drostanolone propionate 100 mg in 1 ml of clear oily solution.

Uses Masteril is indicated for the amelioration of disseminated mammary carcinoma, used either alone or in conjunction with other medication or surgery. Masteril is thought to work by blocking the uptake of oestrogen by oestrogen-dependent carcinoma cells.

Dosage and administration The recommended dose is 300 mg (3 ampoules) weekly given by intramuscular injection. Therapy should be continued until such time as the patient ceases to derive benefit from Masteril.

Contra-indications, warnings, etc There are no known contra-indications to the recommended use of Masteril.

Virilisation may be encountered during prolonged therapy. Other side-effects are very unlikely.

Pharmaceutical precautions Masteril should not be stored in direct sunlight.

Legal category POM.

Package quantities Masteril is available in ampoules of 1 ml (100 mg) packed in boxes of 10.

Further information Nil.

Product licence number 0286/5010.

NAPROSYN* TABLETS

NAPROSYN* 500 TABLETS

NAPROSYN* SUPPOSITORIES

NAPROSYN* SUSPENSION

Presentation Naprosyn (naproxen) is d-2-(6'-methoxy-2-naphthyl) propionic acid, a non-steroidal anti-inflammatory agent, developed by Syntex Research. It is presented as a yellow half-scored tablet containing 250 mg of naproxen, inscribed NAPROSYN on one side and SYNTEX on the other, an oblong, scored yellow tablet containing 500 mg of naproxen inscribed NAPROSYN 500 on one side, a flavoured yellow suspension containing 25 mg/ml naproxen and as suppositories each containing 500 mg naproxen.

Uses Naprosyn is indicated for the treatment of rheumatoid arthritis, osteoarthritis (degenerative arthritis), ankylosing spondylitis, juvenile rheumatoid arthritis, acute gout, and acute musculoskeletal disorders (such as sprains and strains, direct trauma, lumbosacral pain, cervical spondylitis, tenosynovitis and fibrositis).

Naprosyn has been shown to have striking anti-inflammatory analgesic and antipyretic properties when tested in classical animal test systems. It exhibits its anti-inflammatory effect even in adrenalectomised animals, indicating that its action is not mediated through the pituitary-adrenal axis. It inhibits prostaglandin synthetase, as do other non-steroidal anti-inflammatory agents. As with other agents, however, the exact mechanism of its anti-inflammatory action is not known.

Dosage and administration For rheumatoid arthritis, osteoarthritis and ankylosing spondylitis, the usual dose is 500 mg to 1 g per day taken in two doses at 12-hour intervals.

Where 1 g per day is needed, the suggested regime is one Naprosyn 500 tablet twice daily.

In the following cases a loading dose of 750 mg or 1 g per day for the acute phase is recommended:

- (a) In patients reporting severe night-time pain and/or morning stiffness.
- (b) In patients being switched to Naprosyn from a high dose of another anti-rheumatic compound.
- (c) In osteoarthritis where pain is the predominant symptom.

For the patient who requires 750 mg per day and whose night-time pain and/or morning stiffness are most

troublesome, 500 mg should be taken before retiring and 100 mg upon awakening. For the patient whose day-time pain and reduced mobility are most troublesome, 100 mg should be taken upon awakening and 250 mg on retiring.

For the treatment of juvenile rheumatoid arthritis in children over five years of age, the usual dosage is 1 mg/kg/day taken in two doses at 12-hour intervals. In acute gout, the recommended dosage is 750 mg at ce, then 250 mg every eight hours until the attack has ssed.

For the treatment of acute musculoskeletal disorders, e recommended dose is 250 mg twice or thrice daily; ost patients will require only seven days' treatment but me patients may require up to 14 days' treatment.

Naprosyn Suppositories are recommended for patients whom rectal administration may be preferable. One ppository is to be inserted at night.

contra-indications, warnings, etc

contra-indications: Active peptic ulceration.

pecial precautions and warnings: Naprosyn has been und to be well tolerated by patients exhibiting /pepsia with other similar agents. None the less isodes of gastro-intestinal bleeding have been erted in patients with Naprosyn therapy. Naprosyn ould be given under close supervision to patients with history of gastro-intestinal disease.

Due to the high plasma protein binding of Naprosyn, tients simultaneously receiving hydantoins, anti-co- ulants or a highly protein-bound sulphonamide should :bserved for signs of overdosage of these drugs. :obenecid given concurrently increases Naprosyn asma levels and extends its half-life considerably.

Occasional skin rashes and angio-oedema have been ported. Patients who have exhibited aspirin hypersen- itivity in the past (usually as the angio-oedema/asthma ndrome) may exhibit the same phenomenon on aprosyn. Bronchospasm may be precipitated in patients ffering from, or with a previous history of, bronchial thma or allergic disease. The following additional currences have been reported with Naprosyn: nausea, mting, abdominal discomfort, epigastric distress, adache, inability to concentrate, insomnia, tinnitus id vertigo. Thrombocytopenia, granulocytopenia, jaun- ce, aplastic anaemia, haemolytic anaemia, peptic ceration and nephropathy may occur rarely.

Sporadic abnormalities in laboratory tests (e.g. liver nction tests) have occurred in patients on Naprosyn erapy, but no definite trend was seen in any test dicating toxicity.

Naprosyn decreases platelet aggregation and prolongs eeding time. This effect should be kept in mind when eeding times are determined.

It is suggested that Naprosyn therapy be temporarily scontinued 48 hours before adrenal function tests are rformed because Naprosyn may artifactually interfere ith some tests for 17-ketogenic steroids. Similarly, aprosyn may interfere with some assays of urinary 5-/droxyindoleacetic acid.

Mild peripheral oedema has been observed in a few stients receiving Naprosyn. Although sodium retention as not been reported in metabolic studies, it is possible at patients with questionable or compromised cardiac nction may be at a greater risk when taking Naprosyn. aprosyn should be used only with caution in patients ith renal dysfunction, particularly if long-term usage is nder consideration.

Teratology studies in rats and rabbits, at dose levels equivalent on a human multiple basis to those which have produced foetal abnormality with certain other non-steroidal anti-inflammatory agents, e.g. aspirin, have not produced evidence of foetal damage with Naprosyn. As with other drugs of this type Naprosyn produces delay in parturition in animals. The relevance of this finding to human patients is unknown. However, good medical practice indicates minimal drug usage in pregnancy, and use of this class of therapeutic agents requires cautious balancing of possible benefits against potential risks to the mother and foetus.

The use of Naprosyn should be avoided in patients who are breast-feeding.

Overdosage: Significant overdosage of the drug may be characterised by drowsiness, heartburn, indigestion, nausea or vomiting. No evidence of toxicity or late sequelae have been reported 5–15 months after ingestion, for three to seven days, of doses of up to 3 g/day. One patient ingested a single dose of 25 g of naproxen and experienced mild nausea and indigestion. It is not known what dose of the drug would be life-threatening. Should a patient ingest a large amount of naproxen accidentally or purposefully, the stomach may be emptied and usual supportive measures employed. Animal studies indicate that the prompt administration of activated charcoal in adequate amounts would tend to reduce markedly the absorption of the drug.

Pharmaceutical precautions Protect from light.

Legal category POM.

Package quantities Naprosyn Tablets are supplied in canisters of 60 and 250 tablets. Naprosyn 500 Tablets are supplied in canisters of 100 tablets. Naprosyn Suspension is supplied in 500 ml bottles. Naprosyn Suppositories are supplied in boxes containing 10 suppositories.

Further information In addition to the excellent therapeutic efficacy demonstrated by Naprosyn in comparative clinical trials, good tolerance has been demonstrated, even in patients exhibiting multiple intolerance to other commonly used non-steroidal anti-inflammatory agents.

NORIDAY*

Presentation Each pack contains 28 yellow tablets, each containing norethisterone 0.35 mg. Each tablet is stamped NORIDAY on one side and SYNTEX on the other.

Uses Noriday is a progestogen-only oral contraceptive. It is particularly useful for women for whom oestrogens may not be appropriate. Although the mode of action of NORIDAY tablets has not yet been fully defined it is thought that alterations occur in the cervical mucus which inhibit the penetration of sperm, there is substantial inhibition of ovulation, and changes occur in the endometrium which inhibit implantation of the fertilised egg.

Dosage and administration The first Noriday tablet is taken on the FIRST DAY of menstrual bleeding. Thereafter, 1 tablet is taken continuously at the same time every day even during menstrual bleeding.

When starting oral contraception with Noriday tablets, additional precautions must be used for the first 14 days of tablet-taking. Suitable methods are sheaths, caps plus spermicides, and intrauterine devices. The rhythm, temperature and cervical-mucus methods cannot be used.

Tablet omissions: Tablets must be taken daily in order to maintain adequate hormone levels. If a tablet is missed, it should be taken as soon as possible, with the next tablet being taken at the usual time so that two tablets are taken on that date. An additional method of contraception should be used for the next 14 days. If two or more tablets are missed, NORIDAY should be discontinued immediately and a method of non-hormonal contraception should be used until menses has appeared or pregnancy has been excluded.

Contra-indications, warnings, etc

Contra-indications: A history during pregnancy of idiopathic jaundice or severe pruritus; Dubin-Johnson or Rotor syndrome; acute or severe chronic liver diseases; undiagnosed irregular vaginal bleeding; a history of thromboembolic disorders; pregnancy. Special caution should be observed in the presence of pre-existing breast or genital-tract cancer.

Warnings, side-effects: Hypertension, which is usually reversible on discontinuing treatment, has occurred in a small percentage of women taking oral contraceptives. NORIDAY should be used with caution in patients with a history of hepatic dysfunction or hypertension.

A statistical association between the use of oral contraceptives and the occurrence of thrombosis, embolism or haemorrhage has been reported. Patients on such treatments should be kept under regular surveillance, in view of the possibility of development of such conditions as thromboembolism. Risk of coronary artery disease in women taking oral contraceptives is increased by the presence of other predisposing factors such as cigarette smoking, hypercholesterolaemia, obesity, diabetes, history of pre-eclamptic toxemia and increasing age. After the age of thirty-five years, the patient and physician should carefully re-assess the risk/benefit ratio of using oral contraceptives as opposed to alternative methods of contraception.

It is advisable to discontinue Noriday at least six weeks before elective operations and during immobilisation.

Benign and malignant liver tumours have been associated with oral contraceptive use. The relationship between occurrence of liver tumours and use of female sex hormones is not known at present. These tumours may rupture causing intra-abdominal bleeding. If the patient presents with a mass or tenderness in the right upper quadrant or an acute abdomen, the possible presence of a tumour should be considered.

An increased risk of congenital anomalies, including heart defects and limb defects, has been reported following the use of sex hormones, including oral contraceptives, in pregnancy. If the patient does not adhere to the prescribed schedule, the possibility of pregnancy should be considered at the time of the first missed period and further use of oral contraceptives should be withheld until pregnancy has been ruled out. It is recommended that for any patient who has missed two consecutive periods, pregnancy should be ruled out before continuing the contraceptive regimen. If preg-

nancy is confirmed the patient should be apprised of the potential risks to the foetus and the advisability of continuing the pregnancy should be discussed in the light of these risks. It is advisable to discontinue the use of oral contraceptives three months before a planned pregnancy.

Progestogen-only oral contraceptives such as Norida may offer less protection against ectopic pregnancy than against intra-uterine pregnancy.

The incidence of side-effects in clinical trials was lower than that experienced with oestrogen-containing oral contraceptives. Side-effects which did occur included some cycle irregularity during the first few months of therapy, spotting or breakthrough bleeding, amenorrhoea, and occasionally, breast discomfort.

Circumstances requiring additional contraceptive precautions other than the temperature, rhythm and cervical-mucus methods:

1. When changing to Noriday tablets from other hormonal contraceptives, additional contraceptive measures should be employed until 14 consecutive tablets have been taken regularly.

2. Vomiting or diarrhoea may reduce the effectiveness of the tablets by preventing them from being fully absorbed. In the case of repeated vomiting or continued diarrhoea, additional contraceptive measures should be employed for 14 days after the symptoms have subsided.

3. Interaction with other drugs. Some drugs accelerate the metabolism of oral contraceptives taken concurrently. Drugs suspected of having the capacity to reduce the efficacy of oral contraceptives include certain sedatives, antibiotics, anti-epileptic and anti-arthritis drugs.

It is therefore advisable to use non-hormonal methods of contraception during treatment with such drugs.

Menstrual pattern: A usual feature of all progestogen-only oral contraceptives is that they produce an initial irregularity of the bleeding pattern, but such irregularity tends to decrease with time. The patient should be informed before starting Noriday tablets that her menstrual pattern is likely to alter.

Irregular bleeding is, from a medical point of view, no reason for discontinuation of therapy, as long as organic causes and pregnancy can be ruled out. The patient should be instructed that if two or more consecutive periods are missed, she should consult her physician in order to rule out pregnancy.

Use after delivery or abortion: Although after delivery or abortion it is customary to start oral contraception at the end of the first biphasic menstrual cycle, Noriday tablet may be started as early as the seventh day post-partum. Additional contraceptive measures should be employed for the first 14 days of tablet-taking.

Use during breast-feeding: There is no evidence that Noriday tablets diminish the yield of breast milk. Small amounts of steroid materials appear in the milk; their effect on the breast-fed child has not been determined.

Reasons for stopping oral contraception immediately First signs of thrombophlebitis or thromboembolism, jaundice or pregnancy.

Overdosage: Overdosage may be manifested by nausea, vomiting, breast enlargement and vaginal bleeding. There is no specific antidote and treatment should be symptomatic. Gastric lavage may be employed if the overdosage is large and the patient is seen sufficiently early (within four hours).

Pharmaceutical precautions Noriday tablets should be kept under normal storage conditions.

Pharmaceutical category POM.

Pack quantities Noriday tablets are available in blister packs of 3 x 28 tablets.

Further information Nil.

Product licence number 0286/0024.

DRIMIN[®]

Presentation A 21-tablet calendar pack; each yellow tablet contains norethisterone 1.0 mg and ethinyloestradiol 35 mcg.

Uses Norimin is indicated for oral contraception, with the benefit of a low intake of oestrogen. The mode of action of Norimin is similar to that of other progestogen/oestrogen oral contraceptives; its activity is exerted through a combined effect on one or more of the following: hypothalamus, anterior pituitary, ovary, endometrium and cervical mucus.

Dosage and administration The dosage of Norimin for the initial cycle of therapy is 1 tablet taken daily from the 5th to the 25th day of the menstrual cycle, counting the first day of menstrual flow as 'Day 1'. For subsequent cycles, no tablets are taken for seven days, then a new course is started of 1 tablet daily for 21 days. This sequence of 21 days on treatment, seven days off treatment is repeated for as long as contraception is required.

To provide added protection during the first cycle only, the patient should be instructed to use an additional method of contraception for the first 14 days.

Tablet omissions: Tablets must be taken daily in order to maintain adequate hormone levels. If a tablet is missed, it should be taken as soon as possible within 24 hours of the correct time even if this means that 2 tablets are taken together. If 2 tablets are missed, a tablet should be taken as soon as possible so medication is re-established. An additional method of contraception should be used for the remainder of that tablet cycle. If more than 2 tablets have been missed, oral contraceptive therapy should be discontinued immediately and a method of non-hormonal contraception should be used until menstruation has appeared or pregnancy has been excluded.

Changing from another oral contraceptive: Norimin could be started seven days after completing the last course of the other product. An additional mechanical or chemical contraceptive should be used for the first 14 days of tablet-taking.

Use after childbirth, miscarriage or abortion: After childbirth, oral contraception is usually started when spontaneous menstruation has resumed. Another method of contraception should be used in the meantime, unless the first course of tablets is started within seven days of delivery. After a miscarriage or abortion, oral contraception can normally be started on the fifth day.

Contra-indications, warnings, etc

Contra-indications: As with all combined progestogen/oestrogen oral contraceptives, the following conditions should be regarded as contra-indications:

- (i) Thrombophlebitis, thromboembolic disorders, cerebral apoplexy, or a history of these conditions.

- (b) Acute or severe chronic liver disease, Dubin-Johnson or Rotor syndrome, history during pregnancy of idiopathic jaundice or severe pruritus.
- (c) Known or suspected carcinoma of the breast.
- (d) Known or suspected oestrogen-dependent neoplasia.
- (e) Undiagnosed abnormal vaginal bleeding.
- (f) Pregnancy.

Side-effects and precautions: As with all oral contraceptives, there may be slight nausea at first, weight gain or breast discomfort, which soon disappear.

Spotting or bleeding may occur during the first few cycles. Usually menstrual bleeding becomes light and occasionally there may be no bleeding during the tablet-free days.

Hypertension, which is usually reversible on discontinuing treatment, has occurred in a small percentage of women taking oral contraceptives. Progestogen/oestrogen preparations should be used with caution in patients with a history of hepatic dysfunction or hypertension.

A statistical association between the use of oral contraceptives and the occurrence of thrombosis, embolism or haemorrhage has been reported. Patients on such treatments should be kept under regular surveillance in view of the possibility of development of such conditions as thromboembolism.

Risk of coronary artery disease in women taking oral contraceptives is increased by the presence of other predisposing factors such as cigarette smoking, hypercholesterolaemia, obesity, diabetes, history of pre-eclamptic toxemia and increasing age. After the age of thirty-five years, the patient and physician should carefully re-assess the risk/benefit ratio of using combined oral contraceptives as opposed to alternative methods of contraception.

Benign and malignant liver tumours have been associated with oral contraceptive use. The relationship between occurrence of liver tumours and use of female sex hormones is not known at present. These tumours are very rare but they may rupture causing intra-abdominal bleeding. If the patient presents with a mass or tenderness in the right upper quadrant or an acute abdomen, the possible presence of a tumour should be considered.

The use of this product in patients suffering from epilepsy, migraine, asthma or cardiac dysfunction may result in exacerbation of these disorders, because of fluid retention.

A decreased glucose tolerance may occur in diabetic patients on this treatment, and their control must be carefully supervised.

An increased risk of congenital anomalies, including heart defects and limb defects, has been reported following the use of sex hormones, including oral contraceptives, in pregnancy. If the patient does not adhere to the prescribed schedule, the possibility of pregnancy should be considered at the time of the first missed period and further use of oral contraceptives should be withheld until pregnancy has been ruled out. It is recommended that for any patient who has missed two consecutive periods, pregnancy should be ruled out before continuing the contraceptive regimen. If pregnancy is confirmed the patient should be apprised of the potential risks to the foetus and the advisability of continuing the pregnancy should be discussed in the light of these risks. It is advisable to discontinue Norimin three months before a planned pregnancy.

Gastro-intestinal upsets may interfere with the absorption of the tablets. Some drugs may modify the metabolism of Norimin reducing its effectiveness; these include certain sedatives, antibiotics, anti-epileptic and anti-arthritis drugs. During the time such agents are used concurrently, it is advisable that mechanical contraceptives also be used.

Women taking oral contraceptives require careful observation if they have or have had any of the following conditions: breast nodules; fibrocystic disease of the breast or an abnormal mammogram; a history of severe depressive states; varicose veins; sickle-cell anaemia; diabetes; hypertension; high blood cholesterol levels; epilepsy; asthma; otosclerosis; multiple sclerosis; porphyria; tetany; disturbed liver functions; gallstones; cardiovascular disease; kidney disease; chloasma; herpes of pregnancy. The worsening or first appearance of any of these conditions may indicate that the oral contraceptive should be stopped. Contact lenses may become uncomfortable.

Norimin should be discontinued at least six weeks before elective operations and during immobilisation.

Women with a history of oligomenorrhoea or secondary amenorrhoea or young women without regular cycles may have a tendency to remain anovulatory or to become amenorrhoeic after discontinuation of oral contraceptives. Women with these pre-existing problems should be advised of this possibility and encouraged to use other contraceptive methods.

The risk of arterial thrombosis associated with combined oral contraceptives increases with age, and this risk is aggravated by cigarette smoking. The use of combined oral contraceptives by women in the older age group, especially those who are cigarette smokers, should therefore be discouraged and alternative methods advised.

Treatment of overdosage: Overdosage may be manifested by nausea, vomiting, breast enlargement and vaginal bleeding. There is no specific antidote and treatment should be symptomatic. Gastric lavage may be employed if the overdose is large and the patient is seen sufficiently early (within four hours).

Pharmaceutical precautions Norimin should be kept under normal storage conditions.

Legal category POM.

Package quantities Norimin is available in calendar packs of 3 × 21 tablets.

Further information Nil.

Product licence number 0286/0059.

NORINYL* - 1

NORINYL* - 1/28

Presentation Norinyl-1 consists of 21 white tablets, stamped NORINYL on one side and SYNTEX on the other. Each tablet contains norethisterone 1 mg and mestranol 0.05 mg. Norinyl-1/28 has, in addition to 21 white tablets, seven orange tablets containing lactose, stamped SYNTEX on one side.

Uses Norinyl-1 and Norinyl-1/28 are oral contraceptives. They are also useful in the treatment of certain menstrual disorders, e.g. heavy, irregular or painful periods. Activity is exerted through a combined effect on one or more of the following: hypothalamus, anterior pituitary, ovary, endometrium and cervical mucus.

Dosage and administration *Norinyl-1:* the very first tablet is taken by mouth on the *fifth* day of a menstrual period. One tablet is then taken at the same time of day every day, until all 21 tablets are used. The next pack started after *seven tablet-free* days: this sequence repeated for as long as contraception is required.

Norinyl-1/28: The very first tablet is taken on the *first* day of a menstrual period. Tablets should be taken at the same time of day, every day, until all 28 are used. The next pack is started on the *following* day. The first tablet of every course should be chosen from the red section in accordance with the instructions on the pack. Strict care should be exercised to ensure that the tablets are taken in their proper sequence.

The patient should be advised that, during the first 14 days of starting Norinyl-1 (and Norinyl-1/28), an additional mechanical or chemical method of contraception should be used.

Tablet omissions: Tablets must be taken daily in order to maintain adequate hormone levels. If a tablet is missed it should be taken as soon as possible within 24 hours of the correct time even if this means that 2 tablets are taken together. If 2 tablets are missed, a tablet should be taken as soon as possible so medication is re-established. An additional method of contraception should be used for the remainder of that tablet cycle. If more than 2 tablets have been missed, oral contraceptive therapy should be discontinued immediately and a method of non-hormonal contraception should be used until menses has appeared or pregnancy has been excluded.

Changing from another oral contraceptive: Norinyl should be started seven days after completing the last course of the other product. An additional mechanical or chemical contraceptive should be used for the first 7 days of tablet-taking.

Use after childbirth, miscarriage or abortion: After childbirth, oral contraception is usually started when spontaneous menstruation has resumed. Another method of contraception should be used in the meantime unless the first course of tablets is started within seven days of delivery. After a miscarriage or abortion, oral contraception can normally be started on the fifth day.

Contra-indications, warnings, etc

Contra-indications: As with all combined progestogen/oestrogen oral contraceptives, the following conditions should be regarded as contra-indications:

- Thrombophlebitis, thromboembolic disorders, cerebral apoplexy, or a history of these conditions.
- Acute or severe chronic liver disease, Dubin-Johnson or Rotor syndrome, history during pregnancy of idiopathic jaundice or severe pruritus.
- Known or suspected carcinoma of the breast.
- Known or suspected oestrogen-dependent neoplasia.
- Undiagnosed abnormal vaginal bleeding.
- Pregnancy.

Side-effects and precautions: As with all oral contraceptives, there may be slight nausea at first, weight gain, breast discomfort, which soon disappear.

Spotting or bleeding may occur during the first few cycles. Usually menstrual bleeding becomes light or occasionally there may be no bleeding during the tablet-free days.

Hypertension, which is usually reversible on discontinuing treatment, has occurred in a small percentage

nen taking oral contraceptives. Oestrogen-progestin preparations should be used with caution in patients with a history of hepatic dysfunction or hypertension.

statistical association between the use of oral contraceptives and the occurrence of thrombosis, embolism or haemorrhage has been reported. Patients on treatment should be kept under regular surveillance, in view of the possibility of development of such conditions as thromboembolism.

risk of coronary artery disease in women taking oral contraceptives is increased by the presence of other disposing factors such as cigarette smoking, hypercholesterolaemia, obesity, diabetes, history of pre-eclampsia and increasing age. After the age of thirty-five years, the patient and physician should fully re-assess the risk/benefit ratio of using combined oral contraceptives as opposed to alternative methods of contraception.

benign and malignant liver tumours have been associated with oral contraceptive use. The relationship between occurrence of liver tumours and use of female hormones is not known at present. These tumours are very rare but they may rupture causing intra-abdominal bleeding. If the patient presents with a mass tenderness in the right upper quadrant or an acute abdomen, the possible presence of a tumour should be considered.

the use of this product in patients suffering from epilepsy, migraine, asthma or cardiac dysfunction may lead to exacerbation of these disorders, because of fluid retention.

decreased glucose tolerance may occur in diabetic patients on this treatment, and their control must be fully supervised.

Treatment of overdose: Overdosage may be manifested by nausea, vomiting, breast enlargement and vaginal bleeding. There is no specific antidote and treatment should be symptomatic. Gastric lavage may be employed if the overdose is large and the patient is seen sufficiently early (within four hours).

Pharmaceutical precautions Norinyl-1 and Norinyl-1/28 should be kept under normal storage conditions.

Legal category POM.

Package quantities Norinyl-1 is available in packs of 3 x 21 tablets.

Norinyl-1/28 is available in 'push-packs' of 28 tablets (seven placebos).

Further information Nil.

Product licence number 0286/5000.

STAYCEPT* PESSARIES

Presentation Smooth, torpedo-shaped, solid white pessaries containing nonoxynol-9 6% w/w.

Uses Spermicidal contraceptive agent. As with other spermicidal preparations, additional methods of contraception, for example, diaphragm, cap or intra-uterine device, must be used with Staycept pessaries.

When pregnancy is medically contra-indicated, the choice of contraceptive should be made in consultation with a doctor.

Dosage and administration One to be inserted into the vagina before intercourse. When used with a diaphragm or cap, one pessary should be placed inside the diaphragm or cap before it is put into position; a second pessary is then inserted into the vagina as far as possible.

Contra-indications, warnings, etc There are no known contra-indications to the use of Staycept Pessaries.

Pharmaceutical precautions Store in a cool place.

Legal category GSL.

Package quantities Pack of 10 pessaries.

Further information Nil.

Product licence number 0286/5012.

STAYCEPT* JELLY

Presentation A smooth, clear jelly containing octoxynol 1% w/w.

Uses Spermicidal contraceptive agent. As with other spermicidal preparations, additional methods of contraception, for example, diaphragm, cap or intra-uterine device, must be used with Staycept Jelly.

When pregnancy is medically contra-indicated, the choice of contraceptive should be made in consultation with a doctor.

Dosage and administration

- Used with diaphragm. Two 1-inch strips of jelly to be applied to either side of diaphragm and spread in a thin layer over cap and rim.
- Used with intra-uterine device. Two to three inches applied into the vagina, from an applicator.

Contra-indications, warnings, etc There are no known contra-indications to the use of Staycept Jelly.

Pharmaceutical precautions Store in a cool place.

Legal category GSL.

Package quantities 80 g tube.

Further information Staycept Jelly can be used as a lubricant by women who experience difficulty with intercourse because of a dry vagina.

Product licence number 0286/5011.

SYNFLEX*

Presentation Opaque, orange, size 1, hard gelatin capsules marked SYNTEX, each containing naproxen sodium 275 mg (equivalent to naproxen 250 mg).

Uses Synflex is indicated for the treatment of: acute musculo-skeletal disorders (such as sprains and strains, direct trauma, lumbo-sacral pain, cervical spondylitis, fibrositis, bursitis and tendinitis); chronic pain in conditions such as musculo-skeletal disorders and peripheral vascular disease; dysmenorrhoea; uterine pain following IUCD insertion; pain following orthopaedic surgery; postoperative pain; post-partum pain.

Synflex has been shown to have potent analgesic, antipyretic and anti-inflammatory properties when tested in classical animal test systems. It inhibits prostaglandin synthetase, as do other non-steroidal anti-inflammatory agents. As with other agents, however, the exact mechanism of its anti-inflammatory action is not known.

Dosage and administration 1 capsule contains 275 mg of naproxen sodium.

Adults: For bursitis, tendinitis and musculo-skeletal disorders the recommended dosage is 550 mg at once, then 275 mg three or four times daily; most patients will require only seven days' treatment but some patients may require up to fourteen days' treatment.

For dysmenorrhoea and chronic pain the recommended dosage is 550 mg initially followed by 275 mg three or four times daily as needed.

For postoperative and orthopaedic pain the recommended regime is 550 mg initially, followed by 275 mg three to five times daily as needed, with a maximum daily dose after the first day of 1,375 mg (5 capsules).

For post-partum pain a single dose of 550 mg is recommended.

Children: As safety and efficacy studies are not complete, Synflex is not recommended for use in child under 16 years of age.

Contra-indications, warnings, etc

Contra-indication: Active peptic ulceration.

Special precautions: Synflex has been found to be tolerated by patients exhibiting dyspepsia with other similar agents. Nonetheless episodes of gastro-intestinal bleeding have been reported in patients with Synflex therapy. Synflex should be given under close supervision to patients with a history of gastro-intestinal disease.

Due to the high plasma protein binding of Synflex patients simultaneously receiving hydantoins, anti-coagulants, or a highly protein-bound sulphonamide should be observed for signs of overdosage of these drugs. Probenecid given concurrently increases Synflex plasma levels and extends its half-life considerably.

Occasional skin rashes and angio-oedema have been reported. Patients who have exhibited aspirin hypersensitivity in the past (usually as the angio-oedema/asthma syndrome) may exhibit the same phenomenon with Synflex. Bronchospasm may be precipitated in susceptible patients and in patients suffering from, or with a history of, bronchial asthma or allergic disease. The following additional occurrences have been reported with Synflex: nausea, vomiting, abdominal discomfort, epigastric distress, headache, inability to concentrate, insomnia, tinnitus and vertigo. Thrombocytopenia, granulocytopenia, jaundice, aplastic anaemia, haemolytic anaemia, peptic ulceration and nephropathy may occur rarely. Sporadic abnormalities in laboratory tests (e.g. liver function tests) have occurred in patients on Synflex therapy, but no definite trend was seen in any test indicating toxicity.

Synflex decreases platelet aggregation and prolongs bleeding time. This effect should be kept in mind when bleeding times are determined.

It is suggested that Synflex therapy be temporarily discontinued 48 hours before adrenal function tests are performed, because Synflex may artifactually interfere with some tests for 17-ketogenic steroids. Similarly, Synflex may interfere with some assays of urinary hydroxyindoleacetic acid.

Mild peripheral oedema has been observed in some patients receiving Synflex. Although sodium retention has not been reported in metabolic studies, it is possible that patients with questionable or compromised cardiac function may be at a greater risk when taking Synflex. Synflex should be used only with caution in patients with renal dysfunction, particularly if long-term usage is under consideration.

Teratology studies in rats and rabbits, at dose levels equivalent on a human multiple basis to those which have produced foetal abnormality with certain other non-steroidal anti-inflammatory agents, e.g. aspirin, have not produced evidence of foetal damage with Synflex. As with other drugs of this type Synflex delays parturition in animals. The relevance of this finding to human patients is unknown. However, good medical practice indicates minimal drug usage in pregnancy, and use of this class of therapeutic agent requires cautious balancing of possible benefit against potential risk to mother and foetus.

The use of Synflex should be avoided in patients who are breast-feeding.

Overdosage: Significant overdosage of the drug may be characterised by drowsiness, heartburn, indigestion.

as safety and efficacy

Spray, unlike that of
not immediate. Full
r usage. The absence

of an immediate effect should be explained to the patient
in order to ensure cooperation and continuation of
treatment with the regular dosage schedule.

There is no evidence that exceeding the maximum
recommended dosage is more effective; higher dosage
should therefore be avoided.

For full information on using the device, see patient
instruction insert.

Contra-indications, warnings, etc

Contra-indications:

1. Untreated fungal, bacterial or viral nasal infections.
2. Hypersensitivity to the formulation.

Warnings, precautions, side-effects: Glucocorticoids
may mask some signs of infection and new infections
may appear during their use.

Syntaris Nasal Spray is not recommended in the first
three months of pregnancy. If used in the second or third
trimester, the expected benefits should be weighed
against the potential hazards to the foetus.

Care must be taken when transferring patients from
systemic steroid therapy to Syntaris Nasal Spray if there
is reason to suspect that their adrenal function is
impaired.

Although adrenal suppression or atrophy of the nasal
mucosa have not been observed in clinical trials, the
potential for these effects should be considered with
prolonged excessive usage.

Adverse reactions noted in clinical trials with Syntaris
Nasal Spray have been consistent with what one would
expect when applying topical medication to an already
inflamed membrane. The most frequently observed side-
effect was a mild transient nasal burning and stinging
which was occasionally severe enough to warrant
discontinuation of treatment. Other side-effects noted,
in order of decreasing prevalence were: nasal irritation,
epistaxis, runny and stuffy nose, sore throat, hoarseness
and throat irritation. If severe these may require discon-
tinuation of therapy.

Treatment of overdosage: Administration of large
amounts of flunisolide over a short period may produce
suppression of hypothalamic-pituitary-adrenal function.
In such event, Syntaris Nasal Spray should be reduced
immediately to the recommended dosage.

Pharmaceutical precautions Do not refrigerate.

Legal category POM.

Package quantities Each pack of Syntaris contains
one 24 ml bottle and the metered pump/nozzle device.

Further information Nil.

Product licence number 0286/0057.

SYNTEX MENOPHASE*

Presentation Syntex Menophase consists of 28
tablets in a bubble pack. This is a sequential oestrogen-
progestogen product comprising six different formula-
tions arranged so that 1 tablet is taken daily starting with
5 pink, and continuing with 8 orange, 2 yellow, 3 green,
6 blue and 4 lavender tablets.

Composition: Syntex Menophase comprises six
formulations:

	(mg)	(mcg)	Tablets
1. Mestranol	0.0125	(12.5)	5 pink
2. Mestranol	0.025	(25.0)	8 orange
3. Mestranol	0.050	(50.0)	2 yellow
4. Norethisterone	1.00		
Mestranol	0.025	(25.0)	3 green
5. Norethisterone	1.50		
Mestranol	0.030	(30.0)	6 blue
6. Norethisterone	0.75		
Mestranol	0.020	(20.0)	4 lavender

Uses Syntex Menophase is designed for the treatment of hot flushes and sweats and the amelioration of symptoms associated with the climacteric. Problems which can be associated with failure of endogenous oestrogen production and which have improved in clinical studies include: hot flushes and sweats, depression, lack of concentration, emotional lability, nervousness, lethargy, insomnia, loss of libido, senile vaginitis, pruritus, dry skin, arthritis and neuralgia due to senile osteoporosis.

Dosage and administration The patient is advised to take her first tablet on a Sunday and thereafter to take one tablet at the same time each day in sequential order round the pack. She starts a new pack the day after she has taken her last lavender tablet from the previous pack.

Though menopausal symptoms are likely to improve during the first month of treatment, it will be necessary to maintain therapy for 6–12 months. If symptoms recur after discontinuation, further courses can be prescribed.

Contra-indications, warnings, etc

Contra-indications: As with other oestrogen/progestogen containing compounds, previous thromboembolism, active liver disease, pregnancy and undiagnosed irregular vaginal bleeding should be regarded as contra-indications. Caution should be observed in the presence of pre-existing breast or genital-tract cancer.

Precautions:

1. Syntex Menophase is not an oral contraceptive.
2. Syntex Menophase provides sequential graded doses of hormones; the post-menopausal patient with an intact uterus may therefore experience a small, regular monthly bleed. If forewarned of this possibility, it usually causes no distress.

3. Because Syntex Menophase has not been designed as a contraceptive agent, in the event of a tablet omission the patient should discard the tablets missed and take only that tablet appropriate to the day of the week.

4. Hypertension, which is usually reversible on discontinuing treatment, has occurred in a small percentage of women receiving oestrogen/progestogen medication. A statistical association between the use of certain oestrogen/progestogen-containing preparations and a risk of thromboembolism has been reported, although no cause and effect relationship has been proved. Foetal abnormalities have been reported to occur in the offspring of women who have taken progestogens and/or oestrogens during pregnancy. Pregnancy should be ruled out before initiating or continuing the regimen.

Side-effects: The incidence of side-effects is extremely low. Occasionally breast tenderness and nausea may occur in the first month or two, but usually improve during treatment.

Overdosage: May be manifested by: nausea, vomiting, breast enlargement and vaginal bleeding. There is no

specific antidote and treatment should be symptomatic. Gastric lavage may be employed if the overdose is large and the patient is seen sufficiently early (within 6 hours).

Pharmaceutical precautions Syntex Menophase should be stored in a cool place.

Legal category POM.

Package quantities Push-through bubble-pack containing 28 tablets.

Further information Nil.

Product licence number 0286/0027.

TOPILAR* TOPILAR* OINTMENT

Presentation Topilar and Topilar Ointment contain flucilorolone acetonide, which is a topical anti-inflammatory corticosteroid.

Topilar contains flucilorolone acetonide 0.025% w/w completely dissolved in the specially formulated FAF cream base (a combination of fatty alcohols and propylene glycol). The FAPG cream base is a white, non-aqueous hydrophilic, semi-solid vehicle with slight pearly sheen.

Topilar Ointment contains flucilorolone acetonide 0.025% w/w dissolved in an emollient ointment base.

Uses Topilar and Topilar Ointment are indicated for the treatment of steroid-responsive skin conditions such as psoriasis and dermatitis (eczema), e.g. contact, atopic and seborrhoeic dermatitis.

Topilar has the advantage in that it may be used for dermatoses where, because of the character and site of the lesion and the possible use of polythene occlusion supervening infection is a potential hazard. If *fracture* infection supervenes, appropriate anti-infective therapy should be instituted.

Dosage and administration In adults and children a thin smear is applied to the affected areas twice daily. This regimen should be followed until the acute phase has passed. Treatment should be continued for at least one week thereafter with one application daily. The course is completed by a further short period, e.g. two weeks, during which one application is made on alternate days.

Polythene occlusion may be required for difficult cases.

Contra-indications, warnings, etc Topilar and Topilar Ointment are contra-indicated in viral, tuberculous and frank bacterial infections of the skin. In such cases appropriate anti-infective therapy should be instituted according to the doctor's normal practice.

Topical administration of corticosteroids to pregnant animals can cause abnormalities of foetal development. The relevance of this finding to human beings has not been established; however, topical steroids should not be used extensively, i.e. in large amounts or for prolonged periods, in the first trimester of pregnancy.

In infants, the long-term administration of large quantities of topical steroids should be avoided; adrenal suppression may occur even without occlusion. Adrenal suppression occasionally occurs in the long-term treatment of adults, especially if occlusion is used although the effect on the adrenal gland is general

edication with topical
usion, may result in
nated topical steroids,
ould be used with care
ions.

UTOVLAN*

Presentation Each Utovlan Tablet contains norethis-
terone 5 mg. The white tablets are uncoated, circular
bevel-edged and with a break-line.

Uses At low dosage Utovlan is indicated for dysfunc-
tional uterine bleeding, endometriosis, polymenorrhoea,
menorrhagia, metropathia haemorrhagica, postpone-
ment of menstruation, and premenstrual syndrome. At
high dosage Utovlan is recommended for disseminated
carcinoma of the breast.

Dosage and administration Low dosage

*Dysfunctional Uterine Bleeding, Polymenorrhoea, Men-
orrhagia, Dysmenorrhoea and Metropathia Haemorrhag-
ica:* 1 tablet three times daily for 10 days; bleeding
usually stops within 48 hours. Withdrawal bleeding
resembling true menstruation occurs a few days after the
end of treatment. One tablet twice daily, from days 19 to
26 of the two subsequent cycles, should be given to
prevent recurrence of the condition.

Endometriosis: 1 tablet three times daily for a minimum
treatment period of six months. The dosage should be
increased to 4 or 5 tablets a day if spotting occurs. The
initial dosage should be resumed when bleeding or
spotting stops.

Postponement of menstruation: 1 tablet three times
daily, starting three days before the expected onset of
menstruation. Menstruation usually follows within three
days of finishing the treatment.

Pre-menstrual syndrome: 1 tablet daily from days 16 to
25 of the menstrual cycle.

High dosage

For disseminated breast carcinoma the starting dose is 8
tablets (40 mg) per day increasing to 12 tablets (60 mg)
if no regression is noted.

Contra-indications, warnings, etc

Contra-indications: Pregnancy, disturbance of liver
function, history during pregnancy of idiopathic jaundice,
severe pruritus, herpes, undiagnosed irregular vaginal
bleeding.

Side-effects: These rarely occur at the usual dosage
levels of 15 mg per day. Mild nausea has been reported.
High dosage treatment, even over long periods, is well
tolerated; transitory digestive upsets and jaundice have
rarely been reported.

1298

SYNTEX PHARMACEUTICALS LIMITED

If menstrual bleeding should fail to follow a course of UTOVLAN, the possibility of pregnancy must be ruled out before a further course is given.

Pharmaceutical precautions No special precautions.

Legal category POM.

Package quantities Cans of 100 and 1,000

Further information Nil.

Product licence number 0286/5007.

** Trade Mark*

VED-S* TABLETS

Presentation Brown mottled tablets embossed ved-S. Each tablet contains:

glycyrrhizinized liquorice	380 mg
minium hydroxide gel	100 mg
gnesium carbonate	200 mg
dium bicarbonate	100 mg

es Action and indications: For treatment of peptic ulcer and other allied conditions.

The main active constituent of Caved-S is deglycyrrhizinized liquorice, which has peptic ulcer healing and ismolytic activity and is free from deoxycortone like ions (i.e. does not alter serum levels of sodium, assium or chloride). Deglycyrrhizinized liquorice narily enhances the defence mechanism of the cosa by increasing the number of mucus secreting ls. The cell proliferation rate is also increased. The ismolytic activity and the action of the added antacids, viates gastric distress.

Usage and administration Oral administration. The lets should be taken between meals.

ult dose for gastric ulcer: 2 tablets three times a day.

ult dose for duodenal ulcer: Increase to 2 tablets six es a day when necessary.

phyllactic dose: 1 tablet three times a day for gastric er, 2 tablets three times a day for duodenal ulcer.

ildren's dosage 10-14 years: Half adult dose.

The tablets should be lightly chewed and swallowed ; in exceptional cases of objection to taste the tablets ould be broken into a few pieces and then swallowed h a drink of water. No additional antacids need be en.

ntra-indications, warnings, etc Rare cases of d diarrhoea can occur. No other side-effects have an reported.

idy of teratology and embryotoxicity of Caved-S in bits: Summary: No significant differences between ated and control groups were established in any of the ameters analysed. No skeletal or soft-tissue changes re found. The overall results of this study would icate that the compound failed to induce teratological ormalities in the conceptus of the animals studied. e administration of the compound (Caved-S) during s 6-18 of pregnancy did not produce signs of bryotoxicity and no teratogenic potential was dem-strated. However, Caved-S, like all drugs, should be en with caution during pregnancy.

idy of 13 weeks' subacute oral toxicity of Caved-S in gs: Summary: The oral administration of Caved-S for weeks at dose levels of 2,000, 1,000 and 500 mg/kg dy weight appears to be well tolerated by beagle dogs. significant differences were noted in parameters

analysed, either during compound administration or during four-week withdrawal from the dosing schedule.

Treatment of overdosage: No cases of overdosage have been reported. If excessive amounts are taken gastric lavage and supportive symptomatic treatment are recommended.

Pharmaceutical precautions *Storage:* Protect from excessive heat and moisture.

Legal category GSL.

Package quantities Containers of 60, 240 and 600 tablets.

Further information Nil.

Product licence number 0424/5000.

CEDOCARD* -5

Presentation Round white tablets, embossed 'CC' reverse side scored, containing 5 mg isosorbide dinitrate.

Uses For the treatment and prevention of angina pectoris and for the long term management of coronary insufficiency.

Cedocard-5 is a coronary vasodilator having a marked anti-anginal effect when administered sublingually as well as orally.

The mode of action depends on the reduced work load following vasodilation and reduced venous return.

Dosage and administration *Sublingual administration:* Adult dose: For treatment of acute attack of angina pectoris - 1 tablet as required.

Oral administration: Adult dose: For prophylaxis of angina pectoris 1-2 tablets three or four times a day as required.

To prevent nocturnal attacks of angina pectoris - 1-2 tablets before retiring to sleep.

Onset of action sublingually - one to two minutes and duration of up to two hours.

Onset of action orally - 20/30 minutes and duration of four to six hours.

No recommended dose for children.

Contra-indications, warnings, etc Development of tolerance to this drug and cross tolerance to other nitrates and nitrites.

Adverse reaction: Cutaneous vasodilation with flushing, transient episodes of dizziness and weakness, and other signs of cerebral ischaemia, may occur with postural hypotension.

Treatment of overdosage: In rare cases of overdosage, gastric lavage is indicated. Passive exercise of the extremities of the recumbent patient will promote venous return.

Pharmaceutical precautions *Storage:* Protect from heat and moisture.

Legal category P.

Package quantities Containers of 60 and 180.

Further information The high solubility of Cedocard-5 facilitates rapid dissolution after sublingual administration resulting in quick relief from an acute anginal attack. The unique formulation enables the same tablet to be swallowed, when a more prolonged action is obtained.

Cedocard-5 is more stable than trinitrin offering greater reliability.

Cedocard-5 may be prescribed in combination with beta-blocking agents.

Product licence number 0424/5001.

CEDOCARD-10*

Presentation Round, rose coloured tablets, scored on one side and imprinted with CC on the other side. Each tablet contains 10 mg isosorbide dinitrate.

Uses For the prophylaxis of angina pectoris.

Cedocard-10 relaxes vascular smooth muscle, dilates coronary vessels, reduces peripheral resistance and venous return, resulting in alteration of myocardial metabolism and reduction of myocardial oxygen demand.

Dosage and administration For oral administration.

Adult dose: 1–3 tablets four times daily. Onset of action 20–30 minutes and duration of four to six hours.

There is no recommended dose for children.

Contra-indications, warnings, etc

Contra-indications: A history of sensitivity to the drug.

Precautions: Tolerance and cross-tolerance to other nitrates may occur.

Adverse reactions: Transient headaches, these can usually be controlled by temporary dosage reduction.

Cutaneous vasodilation with flushing, transient episodes of dizziness and weakness, and other signs of cerebral ischaemia, may occur with postural hypotension.

Treatment of overdose: In rare cases of overdose, gastric lavage is indicated. Passive exercise of the extremities of the recumbent patient will promote venous return.

Pharmaceutical precautions *Storage:* Protect from heat and moisture.

Legal category P.

Package quantity Containers of 100 tablets.

Further information Nil.

Product licence number 0424/0015.

CEDOCARD-20*

Presentation Round, flat, bevel-edged blue tablets, scored on one side and imprinted CC on the other side, containing 20 mg isosorbide dinitrate per tablet.

Uses For the treatment of severe congestive heart failure. Cedocard-20 reduces elevated left ventricular filling pressure in patients with congestive heart failure, and lowers peripheral resistance, which leads to a

reduced after load; therefore, the heart has to perform less work to overcome the peripheral resistance.

For the prophylaxis of angina pectoris.

Dosage and administration Oral administration.

Severe congestive heart failure: After determination of peripheral resistance, arterial and pulmonary pressure and stroke volume, half a tablet of Cedocard-20 administered. On the basis of its effect on these parameters, an effective dose of Cedocard-20 is established. This dose can vary between $\frac{1}{2}$ and 2 tablets, and is then administered every 4 hours. Haemodynamic monitoring of the treatment should be carried out.

Angina prophylaxis: One half to 2 tablets three or four times daily.

No recommended dose for children.

Contra-indications, warnings, etc

Contra-indications: Hypotension, cardiac shock, known sensitivity to the drug.

Precautions: Treatment of severe congestive heart failure with Cedocard-20 should be checked haemodynamically, by measuring the intra-arterial pressure, pulmonary artery pressure, stroke volume, and peripheral resistance.

Adverse reactions: Transient headaches at the start of therapy; these can usually be controlled by temporary dosage reduction.

Treatment of overdose: In rare cases of overdose, gastric lavage is indicated. Passive exercise of the extremities of the recumbent patient will promote venous return.

Pharmaceutical precautions *Storage:* Protect from heat and moisture.

Legal category POM.

Package quantities Packs of 100 tablets.

Further information Nil.

Product licence number 0424/0008.

CEDOCARD RETARD* - 20

Presentation Round yellow sustained-release tablets embossed CC, SR and scored on reverse side, each containing 20 mg isosorbide dinitrate.

Uses For the prophylaxis of angina pectoris.

The active principle of Cedocard Retard-20 is isosorbide dinitrate which relaxes vascular smooth muscle and produces coronary vasodilation, reduction in peripheral resistance and venous return, alteration of myocardial metabolism, and reduction of the myocardial oxygen demand.

Dosage and administration For oral administration.

Adult dose: One tablet in the morning and 1 tablet before retiring to sleep. Onset of action 20–30 minutes and duration of action is 10–12 hours.

There is no recommended dose for children.

Contra-indications, warnings, etc

Contra-indication: A history of sensitivity to the drug.

Precautions: Tolerance and cross-tolerance to other nitrates may occur.

Adverse reactions: Cutaneous vasodilation with flushing, transient episodes of dizziness and weakness, and other signs of cerebral ischaemia, may occur with postural hypotension.

treatment of overdosage: In rare cases of overdosage, stric lavage is indicated. Passive exercise of the extremities of the recumbent patient will promote venous return.

Pharmaceutical precautions *Storage:* Protect from heat and moisture.

Legal category P.

Package quantities Containers of 60 tablets.

Further information Nil.

Product licence number 0424/0007.

EDOCARD* IV

Presentation Clear glass ampoules containing 10 mg isosorbide dinitrate in 10 ml of colourless isotonic saline solution.

Uses For the treatment of unresponsive congestive heart failure, particularly after myocardial infarction. Cedocard infusion reduces elevated left ventricular filling pressure in patients with congestive heart failure. For the control of refractory angina pectoris.

Dosage and administration Administration by intravenous infusion only.

Adult dose: The dosage must be determined individually. Doses of 2–10 mg per hour (33–167 mcg/min) are recommended.

There is no recommended dose for children.

Start the infusion with 2 mg/hour and increase progressively according to the evolution of haemodynamic parameters and the clinical condition of the patient. Gradually decrease the concentration of infusion and switch to oral or sublingual isosorbide dinitrate. There should be no abrupt interruption of the infusion except in severe hypotension. Continuous haemodynamic supervision during the infusion is required.

Preparation of solution for infusion: The contents of Edocard IV must be administered by infusion only.

Cedocard IV can be diluted with isotonic saline, 5–10% glucose solution or Krebs-Ringer solution.

Contra-indications, warnings, etc

Contra-indications: Hypotension, cardiogenic shock.

Precautions: Close supervision of the patient is necessary for safe and optimum treatment. Cedocard IV must be administered by infusion after dilution.

If PVC infusion bags (e.g. Travenol Vialflex, Boots Teriflex) and administration sets are used for Cedocard infusion, 15–30% of the drug can be lost by adsorption. There is no loss of active constituent from solution in glass or polyethylene apparatus.

It is recommended that Cedocard IV is administered using a syringe pump (glass or rigid plastic) with short sections of polyethylene tubing. Alternatively, a polyethylene infusion bag (e.g. Boots Polyfusor) may be used.

Should only PVC infusion bags be available, then it is important to carry out close haemodynamic monitoring of the patient; infusion rate should be modified according to required haemodynamic response. PVC bags of 500 ml volume should be used to minimise adsorption of isosorbide dinitrate.

Adverse reactions: Headache. In the case of an excessive reduction in blood pressure, phenomena indicating a reduced blood supply to the heart may appear.

Treatment of overdosage: If arterial systolic blood pressure drops below 90 mm. Hg, and if heart rate increases above 10% of its initial value, the infusion should be discontinued to allow a return to pretreatment levels. Passive exercise of the extremities of the recumbent patient will promote venous return.

Pharmaceutical precautions Protect from exposure to excessive heat. The Cedocard dilution for infusion is stable up to 24 hours.

Legal category POM.

Package quantities Packs of 10 ampoules.

Further information Nil.

Product licence number 0424/0012.

CEDURAN* TABLETS

Presentation Light khaki-coloured tablets, embossed 'CEDURAN' one side, scored reverse side. Each tablet contains:

Nitrofurantoin BP	100 mg
Deglycyrrhizinated liquorice	250 mg

Uses Ceduran has a powerful antibacterial action in the urine, with a broad spectrum that is effective against Gram-positive and Gram-negative bacteria with the exception of *Pseudomonas*. Orally administered Ceduran is absorbed quickly and excreted almost exclusively by the tubuli via the kidneys. The addition of deglycyrrhizinated liquorice does not affect the action of nitrofurantoin, but prevents the nausea, vomiting and gastro-intestinal disorders caused when nitrofurantoin is administered alone.

For the treatment of urinary tract infections.

Dosage and administration *Adults:* In acute urinary infections, 3–4 tablets daily.

In chronic urinary tract infections for prevention of relapse, 1–2 tablets daily.

Children: In acute urinary infections, 5–8 mg of nitrofurantoin per kg of body weight daily.

In chronic urinary tract infections, 2–4 mg of nitrofurantoin per kg of body weight daily. The tablets should be taken with food or milk.

Contra-indications, warnings, etc Insufficient renal function, prematurity, infants younger than one month, or of weight under 2,500 g.

Not recommended during the first trimester of pregnancy. In susceptible patients Ceduran may cause allergic symptoms such as erythema, rash, pruritis, pleuro-pneumonitis, eosinophilia and anaphylactoid reactions. Some reports have occurred of leucopenia, agranulocytosis (rare), polyneuritis, haemolytic anaemia with G6 PD deficiency and cholestatic icterus.

Treatment with Ceduran may colour the urine dark yellow or brown, which is caused by the presence of breakdown metabolites and is quite harmless.

Treatment of overdosage: Excessive intake would probably cause vomiting. Should overdosage occur, gastric lavage is recommended.

Pharmaceutical precautions *Storage:* Protect from excessive heat and moisture.

Legal category POM.

Package quantities 100 tablets foil packed.

Further information Nil.

Product licence number 0424/5002.

COLPERMIN*

Presentation A light blue/dark blue enteric coated hard gelatine capsule size 1, with a green band between cap and body. Each capsule contains 0.2 ml standardised peppermint oil BP.

Uses For the treatment of symptoms of discomfort and of abdominal colic and distension experienced by patients with irritable bowel syndrome.

The enteric coating of the capsule delays release of the peppermint oil until it reaches the distal small bowel. The oil exerts a local effect of colonic relaxation and a fall of intracolonic pressure.

Dosage and administration For oral administration.

Adult dose: One capsule three times a day, preferably before meals and taken with a small quantity of water. The capsules should *not* be taken immediately after food.

The dose may be increased to two capsules, three times a day when discomfort is more severe.

The capsules should be taken until symptoms resolve, usually within one or two weeks. At times when symptoms are more persistent, the capsules can be continued for longer periods of between 2 to 3 months.

There is no experience in the use of these capsules in children under the age of 15 years.

Contra-indications, warnings, etc

Precautions: The capsules should not be broken or chewed because this would release the peppermint oil prematurely, possibly causing local irritation of the mouth and oesophagus.

Patients who already suffer from heartburn, sometimes experience an exacerbation of these symptoms when taking the capsule. Treatment should be discontinued in these patients.

Colpermin, as with all drugs should be given with caution during pregnancy.

Adverse effects: Heartburn; sensitivity reactions to menthol, which are rare, and include erythematous skin rash, headache, bradycardia, muscle tremor and ataxia.

Treatment of overdosage: If capsules have been recently ingested, the stomach should be emptied by gastric lavage. Observation should be carried out with symptomatic treatment if necessary.

Pharmaceutical precautions Store in a cool place. Avoid direct sunlight.

Legal category P.

Package quantities Containers of 100 capsules.

Further information Nil.

Product licence number 0424/0009.

NIFEREX*

Presentation Niferex is a non-ionic polysaccharide iron complex.

Tablets, brown, each containing the equivalent 50 mg elemental iron.

Elixir, brown, flavoured, containing the equivalent 100 mg elemental iron per 5 ml teaspoonful.

Uses Haemopoietic. For the prophylaxis and treatment of uncomplicated iron-deficiency anaemia.

Dosage and administration *Prophylactic dose:*

Adults: 1 tablet or 2½ ml elixir daily.

Therapeutic dose: *Adults:* 2 tablets or 5 ml elixir once twice daily.

Children 6–12 years: 5 ml elixir daily.

Children 2–6 years: 2½ ml elixir daily.

Infants: 1 drop elixir (paediatric) per 1 lb body weight three times a day (one drop contains approximately 0.6 mg elemental iron).

Contra-indications, warnings, etc No specific contra-indications, but obviously Niferex should not be given to patients with known iron overload. In common with all oral iron preparations Niferex should be given with caution where there is peptic ulceration.

Treatment of overdosage: Gastric lavage is recommended. Previous case reports of overdose have not resulted in serious adverse effects.

Pharmaceutical precautions Niferex Tablets should be kept in a sealed container and dispensed in moisture-proof containers. Niferex elixir can be diluted with distilled water or sorbitol to almost any concentration without stability problems, as long as the pH is maintained above 5.

Legal category P.

Package quantities *Tablets:* Plastic container of 10 tablets.

Elixir: Bottle of 240 ml.

Paediatric elixir: Dropper bottle of 30 ml.

Further information Niferex is a highly water-soluble polysaccharide-iron complex which is stable in the range pH 4.5–11.0, and disassociates only after leaving the stomach. The iron is released over a period of one hour circumventing the nausea associated with sudden doses of free iron. In elixir form, the complex remains in solution and does not precipitate in gastric or duodenal fluid.

Niferex provides a good haemopoietic response with almost complete absence of side-effects normally associated with oral iron therapy. Acute toxicity studies have shown a safety factor at least 13 times greater than ferrous sulphate.

Landford Forum

Dorset

AFADOL*

Presentation Yellow tablet, bisected. Each tablet contains:

racetamol BP 500 mg
aspirine BP 30 mg

Uses For analgesia without sedation mild to moderate in associated with muscular disorders, tension, headaches, dysmenorrhoea, colds, arthritis and rheumatism.

Dosage and administration *Adult dose:* 2 tablets every three to four hours. As necessary.

Children age 5–12 years: 1 tablet.

Contra-indications, warnings, etc Nil.

Pharmaceutical precautions Store in cool dry place.

Legal category P.

Package quantities 100.

Further information Nil.

Product licence number 0551/5001.

EFFERCITRATE* TABLETS

Presentation White, circular, flat, effervescent tablets with a slightly rough surface, weighing about 2.7 g, 12 mm in diameter and having the odour of lemon and lime.

Each tablet contains the equivalent of 1.5 g of potassium citrate BP and 250 mg citric acid BP in a pleasantly flavoured effervescent base.

Uses Effercitrate tablets provide a convenient and reliable method to administer potassium citrate to increase the alkali reserve and render the urine more alkaline when treating urinary tract infections. They may also be used to prevent crystalluria during treatment with sulfonamides. Effercitrate Tablets do not have the uric acid increasing effect of bicarbonate on gastric secretion and are less purgative than potassium tartrate.

Dosage and administration *Adults and children over 12 years of age:* Two tablets in a tumblerful of water up to three times daily.

Children Age 1–6 years: One tablet in a tumblerful of water up to three times daily.

Not recommended for children under 1 year.

Sufficient should be given in all cases to render and maintain the urine alkaline.

Contra-indications, warnings, etc A mild diuresis usually follows treatment with Potassium Citrate.

Each tablet contains 13.9 mmol potassium. Care should be taken to prevent hyperkalaemia particularly in patients with impaired renal function.

Side-effects: In common with other potassium salts Effercitrate may give rise to gastric irritation and the tablets must always be taken well diluted with water. Gastric effects may be minimized by giving doses with or after meals.

Overdosage: Hyperkalaemia. Below 6.5 mmol per litre poisoning is minimal, moderate up to 8 mmol per litre and severe above 8 mmol per litre. Absolute toxicity is governed by pH and sodium levels. Hyperkalaemia symptoms, may be transiently controlled with calcium gluconate, glucose or glucose and insulin, sodium bicarbonate or hypertonic sodium infusions, cationic exchange resins, or haemo and peritoneal dialysis. Patients who are digitalized may experience acute digitalis intoxication during potassium removal.

Pharmaceutical precautions Store in a cool dry place. Effercitrate tablets are hygroscopic and should be dispensed in the original containers which include a desiccant, and should be kept closed.

Legal category P.

Package quantities Tubes contain 12 tablets.

Further information Each Effercitrate tablet contains the equivalent of the Potassium Citrate and Citric acid content of 5 ml Potassium Citrate Mixture BPC 1973.

Product licence number 0051/0002.

VERACUR* GEL

Presentation Clear, water-miscible gel in a tube. Veracur Gel contains 1.5% v/v of Solution of Formaldehyde BP.

Uses Treatment of warts, particularly plantar warts (verrucae).

Dosage and administration To be applied directly on to the wart (verruca) and covered with a plaster, twice a day. Remove the outer dead layers with an emery board or pumice stone as the treatment progresses.

Contra-indications, warnings, etc If required protect surrounding skin with a thin film of Vaseline petroleum jelly before application.

For external use only.

Not to be applied to broken skin.

Pharmaceutical precautions Store in cool dry place.

Legal category GSL.

Package quantities 15 g.

Further information Nil.

Product licence number 0551/5000.

*Trade Mark

ALBAMYCIN T*

Presentation Capsules (blue/grey) containing 125 mg novobiocin as novobiocin sodium and 125 mg tetracycline as tetracycline hydrochloride.

Yellow-orange granules for reconstitution as paediatric suspension, each 5 ml containing 62.5 mg novobiocin as novobiocin calcium and 62.5 mg tetracycline as tetracycline base.

Uses Antibacterial. Acute and chronic infections of the upper and lower respiratory tract, pyoderma, acne, urinary tract infections caused by organisms sensitive to the antibiotic combination.

Dosage and administration Oral.

Adults: 2 capsules every 12 hours. In severe infections 2 capsules every eight or six hours.

Children: Dosage is based upon 7.5 mg novobiocin plus 7.5 mg tetracycline/kg/day given in 2 divided doses. In severe infection the dose may be doubled.

Paediatric suspension: 0-6 months: 1.25-2.5 ml every 12 hours.

6 months to 2 years: 2.5-5 ml every 12 hours.

3-9 years: 5-10 ml every 12 hours.

The paediatric suspension should be reconstituted by adding 83 ml purified water slowly to the granules and shaking to promote suspension.

Contra-indications, warnings, etc

Contra-indications: Sensitivity to either antibiotic. Since novobiocin may interfere with the conjugation of bilirubin, administration to neonates is not recommended.

Side-effects: Nausea, urticaria, maculopapular rash, transient leucopenia and other blood dyscrasias have been reported. Tooth discoloration in children may occur if high dosages have been given in the neonatal period or early childhood or during the last trimester of the mother's pregnancy.

Overdosage: No action is deemed necessary. In the event of renal impairment being present, tetracycline will accumulate in the serum and dialysis is suggested in order to avoid possible liver damage.

Pharmaceutical precautions Albamycin T should be stored at a temperature not exceeding 30°C. Only purified water should be used to reconstitute the paediatric granules. A degree of frothing may be experienced on reconstitution.

After reconstitution Albamycin T Paediatric may be stored for one week without significant loss of potency.

Where further dilution is required use purified water.

Legal category POM.

Package quantities Albamycin T Capsules in bottles of 16 and 100.

Albamycin T Paediatric as dry granules for reconstitution to make 100 ml.

Further information Albamycin T is of particular value in mixed infections. The antibacterial actions novobiocin and tetracycline are dissimilar and this assists in the prevention of the rapid emergence resistant strains of susceptible bacteria.

Capsules 0032/5005

Granules 0032/5004

AMBAXIN* ▼

Presentation White to off-white rod-shaped score tablets with parallel sides and rounded ends, contain 400 mg bacampicillin hydrochloride, one side prin Upjohn, other side 130 on either side of the score.

Uses Antibacterial. Ambaxin is indicated in the treatment of infections due to susceptible strains of following: Gram-positive organisms - Streptococci (including *S. faecalis*), pneumococci, non-penicillina producing staphylococci, *Clostridia* spp. and *L. monocytogenes*. Gram-negative organisms - *H. influenzae meningococci*, *N. gonorrhoea*, *E. coli*, *P. mirabilis* and *Shigella* and *Salmonella*.

The indications for Ambaxin include the following: sinusitis, tonsillitis, peritonitis, acute and chronic bronchitis, pneumonia, skin and soft tissue infections, urinary infections, gonorrhoea, otitis media, pleurisy, acute endometritis, post-operative infections and paratyphoid fever. In vitro studies should be performed to determine causative organisms and their susceptibility to Ambaxin. Therapy may be initiated prior to obtaining results of susceptibility testing.

Penetration into the cerebrospinal fluid and brain occurs only when the meninges are inflamed.

Ampicillin, 10 mcg discs, should be used to determine the in vitro susceptibility of organisms to Ambaxin.

Ambaxin has no appreciable antibacterial activity in vivo but is rapidly hydrolysed to ampicillin in vivo, thus antibacterial spectrum is the same as that of ampicillin.

Cross-resistance with cephalosporins and penicillin may occur.

Dosage and administration The usual dosage for adults is one 400 mg tablet two or three times a day. Dosage may be doubled in severe infections or when infection is caused by less sensitive pathogens. The dosage for children over 5 years is one half a 400 mg tablet (200 mg) three times daily.

The dose for uncomplicated gonorrhoea is 1600 mg plus 1 gram probenecid in a single dose.

Contra-indications, warnings, etc

Contra-indications: A history of previous hypersensitivity to any of the penicillins is a contra-indication.

Warnings and precautions: The possibility of superinfection with mycotic organisms or bacterial pathogens should be kept in mind during therapy. Particular care should be taken in the treatment of atopic individuals. The risk of skin reaction is particularly high in patients with a history of allergic reactions.

in infectious mononucleosis or lymphatic leukaemia. with other potent antibiotics, periodic assessment of organ system function, including renal, hepatic and haematopoietic, should be made during prolonged therapy. Safety for use in pregnancy has not been established.

Side-effects: Ambaxin is well tolerated. Since bacampicillin is hydrolysed to ampicillin in-vivo, the possibility of countering those side-effects associated with ampicillin should be considered. Side-effects are generally mild, and of the usual penicillin type. Interruption of treatment is not usually necessary. The incidence of diarrhoea as a side-effect is lower than that seen with ampicillin.

Dosage: Since Ambaxin is a penicillin, problems of overdosage are unlikely to be encountered.

Pharmaceutical precautions Store at room temperature (15–25°C).

Legal category POM.

Package quantities 100 tablets in glass bottles.

Further information Ambaxin is more rapidly absorbed than equimolar amounts of ampicillin, and achieves three times the serum levels of ampicillin in 1/2 to 1 hour, thereby increasing its penetration into tissues of body fluids such as sinus mucosa and sputum, achieving concentrations greatly exceeding MIC's of susceptible pathogens. Ambaxin may be given without regard to time of food intake.

Product licence number 0032/0070.

COLESTID*

Presentation Light yellow, tasteless and odourless granules consisting of colestipol hydrochloride with 2% colloidal silicone dioxide.

Uses Ion-exchange resin which lowers plasma cholesterol levels through binding with bile acid in the intestinal lumen.

Colestid is indicated as adjunctive therapy to diet in the management of patients with elevated cholesterol levels. It has been shown to have no significant effect on glyceride levels.

Although Colestid is effective in all types of hypercholesterolaemia, it is medically most appropriate in patients with Fredrickson's type II hyperlipoproteinemia.

In patients with xanthomas, the skin lesions have been reported to regress on Colestid therapy.

Dosage and administration Colestid should be mixed with water or other fluids before ingesting.

The recommended total daily adult dosage of Colestid is 15–30 grams. This may be taken in divided doses two to four times daily.

Patients should take other drugs at least one hour before or one hour after Colestid to minimise possible interference with their absorption.

Preparation: To prepare Colestid, add the contents of a packet or scoop to 100 ml or more of the preferred vehicle (water, orange, tomato, or other fruit juices, milk) and mix thoroughly until dispersed. Alternatively, Colestid may be added to soups or pulpy fruits with a high water content or to carbonated beverages.

Contra-indications, warnings, etc

Contra-indications: Colestipol is contra-indicated in individuals who have previously demonstrated hypersensitivity to its use.

Warnings: To avoid accidental inhalation or oesophageal distress, Colestid should not be taken in its dry form.

Safety for use in pregnant women or in children has not been established.

Precautions: In man, Colestid may interfere with the absorption of certain drugs (e.g. digitalis and its alkaloids, tetracycline hydrochloride, chlorothiazide and penicillin G). Colestid has been shown not to interfere with the absorption of clindamycin, clofibrate, aspirin, tolbutamide, warfarin and methyl dopa. The clinical response to concomitant medication should be closely monitored and appropriate adjustments made.

Side-effects: The most common adverse reactions reported with Colestid have been of a functional gastrointestinal nature. The most frequent is constipation, which is usually mild, transient and responsive to the usual adjunctive measures.

Transient and modest elevation of SGOT and of alkaline phosphatase have been observed. No medical significance is attached to these observed changes.

Overdosage: No toxic effects due to overdosage have been reported.

Pharmaceutical precautions None.

Legal category POM.

Package quantities Box containing 30 x 5 gram foil sachets. Also 250 gram bottles.

Further information Colestid is not absorbed; its action is limited to the lumen of the gastro-intestinal tract, and it is passed in the faeces. It binds bile acids in the intestinal lumen and causes them to be excreted in the faeces together with the polymer.

When the enterohepatic circulation of bile acids is interrupted, cholesterol conversion to bile acids is enhanced and plasma cholesterol levels are thereby lowered. In addition, Colestid may also reduce plasma and tissue cholesterol levels by decreasing the intestinal bile acid concentration below that required for maximum cholesterol absorption.

Foil Sachet 0032/0055

Bottle Pack 0032/0057

CYTOSAR*

Presentation Off-white, freeze-dried cake of 100 mg cytosine arabinoside (cytarabine) in a rubber-capped vial.

Uses Cytotoxic. For induction of remission in acute myeloid leukaemia in adults and for other acute leukaemias of adults and children.

Dosage and administration By intravenous infusion or injection, and subcutaneous injection. The accompanying 5 ml ampoule containing water for injection and 0.9% w/v benzyl alcohol should be used for preparing a solution of cytarabine in the vial. Such solution contains 20 mg/ml cytarabine.

The physician is reminded that in practice Cytosar has been administered in combination with a variety of other cytotoxic agents using a number of different dosage schedules, and reference to the current literature before commencing treatment is recommended.

Dosage recommendations may be converted from those in terms of bodyweight to those related to surface

area by means of nomograms such as are presented in Documenta Geigy.

1. *Remission induction: Adults:* (a) Continuous treatment:

- (i) Rapid injection – 2 mg/kg/day is a judicious starting dose. Administer for 10 days. Obtain daily blood counts. If no antileukaemic effect is noted and there is no apparent toxicity, increase to 4 mg/kg/day and maintain until therapeutic response or toxicity is evident. Almost all patients can be carried to toxicity with these doses.
- (ii) 0.5–1.0 mg/kg/day may be given in an infusion of up to 24 hours duration. Results from one-hour infusions have been satisfactory in the majority of patients. After 10 days this initial daily dose may be increased to 2 mg/kg/day subject to toxicity. Continue to toxicity or until remission occurs.

(b) Intermittent treatment:

3–5 mg/kg/day is administered intravenously on each of five consecutive days. After a two to nine-day rest period, a further course is given. Continue until response or toxicity occurs.

The first evidence of marrow improvement has been reported to occur 7–64 days (mean 28 days) after the beginning of therapy.

In general, if a patient shows neither toxicity nor remission after a fair trial, the cautious administration of higher doses is warranted. As a rule patients have been seen to tolerate higher doses when given by rapid intravenous injection as compared with slow infusion. This difference is due to the rapid metabolism of Cytosar and the consequent short duration of action of the high dose.

Children: Children appear to tolerate higher doses than adults and, where dose ranges are quoted, the children should receive the higher dose and the adults the lower.

2. *Maintenance therapy:* Remissions which have been induced by cytarabine, or by other drugs, may be maintained by intravenous or subcutaneous injection of 1 mg/kg once or twice weekly.

Contra-indications, warnings, etc

Contra-indications: Therapy with Cytosar should not be considered in patients with pre-existing drug-induced bone marrow suppression, unless the clinician feels that such management offers the most hopeful alternative for the patient. Cytosar should not be used in the management of non-malignant disease, except for immunosuppression.

Warning: Cytosar is a potent bone marrow suppressant. Therapy should be started cautiously in patients with pre-existing drug-induced bone marrow suppression. Patients receiving this drug must be under close medical supervision and, during induction therapy, should have leucocyte and platelet counts performed daily. Bone marrow examinations should be performed frequently after blasts have disappeared from the peripheral blood. Facilities should be available for management of complications, possibly fatal, of bone marrow suppression (infection resulting from granulocytopenia and other impaired body defences, and haemorrhage secondary to thrombocytopenia). One case of anaphylaxis that resulted in acute cardiopulmonary arrest and required resuscitation has been reported. This occurred immediately after the intravenous administration of Cytosar.

Severe and at times fatal CNS, GI and pulmonary toxicity (different from that seen with conventional

therapy regimens of Cytosar) has been reported following some experimental Cytosar dose schedules. The reactions include reversible corneal toxicity; cerebellar and cerebellar dysfunction, usually reversible; severe gastrointestinal ulceration, including pneumatosis cystoides intestinalis, leading to peritonitis; sepsis and liver abscess; and pulmonary oedema. Cytosar is known to be teratogenic in some animal species. The use of Cytosar in women who are, or who may become, pregnant should be undertaken only after due consideration of the potential benefits and hazards.

This product should not normally be administered to patients who are pregnant or to mothers who are breastfeeding.

Cytosar has been shown to be carcinogenic in animals. The possibility of a similar effect should be borne in mind when designing the long-term management of the patient.

Precautions: Patients receiving Cytosar (cytarabine) must be monitored closely. Frequent platelet and leucocyte counts are mandatory. Suspend or modify therapy when drug-induced marrow depression has resulted in a platelet count under 50,000 or a polymorphonuclear count under 1,000 per mm³. Counts of formed elements in the peripheral blood may continue to fall after the drug is stopped and reach lowest values after drug-free intervals of five to seven days. If indicated, restart therapy when definite signs of marrow recovery appear (e.g. successive bone marrow studies). Patients whose drug is withheld until 'normal' peripheral blood values are attained may escape from control.

When intravenous doses are given quickly, patients are frequently nauseated and may vomit for several hours afterwards. This problem tends to be less severe when the drug is infused.

The human liver apparently detoxifies a substantial fraction of an administered dose. Use the drug with caution and at reduced dose in patients whose liver function is poor.

Periodical checks of bone marrow, liver and kidney functions should be performed in patients receiving Cytosar.

The safety of this drug for use in infants is not established.

Like other cytotoxic drugs, Cytosar may induce hyperuricaemia secondary to rapid lysis of neoplastic cells. The clinician should monitor the patient's blood uric acid level and be prepared to use such supportive and pharmacological measures as may be necessary to control this problem.

Side-effects: Adverse reactions seen with cytarabine treatment have included those seen with cytotoxic agents having an effect on bone marrow, such as leucopenia, thrombocytopenia, anaemia, bone marrow suppression and megaloblastosis. Other side-effects have included: nausea, vomiting, diarrhoea, oral ulceration, hepatic dysfunction. Occasional adverse experiences have been reported as follows: renal dysfunction, anorexia, sepsis, gastro-intestinal haemorrhage, irritation or sepsis at site of injection, neuritis or neurotoxicity, rash, freckling, oesophagitis, skin and mucosal bleeding, chest pain, joint pain and reduction in reticulocytes.

A Cytosar syndrome has been described. It is characterised by fever, myalgia, bone pain, occasionally chest pain, maculopapular rash, conjunctivitis and malaise. It usually occurs 6–12 hours following drug administration. Corticosteroids have been shown to be beneficial in treating or preventing this syndrome. If the symptoms of

se syndrome are serious enough to warrant treatment, corticosteroids should be contemplated as well as continuation of therapy with Cytosar.

verdosage: Cessation of therapy, followed by management of ensuing bone marrow depression including whole blood or platelet transfusion and antibiotics as quired.

harmaceutical precautions Reconstituted solutions should be stored at room temperature and used within 48 hours.

Discard any solution in which a slight haze develops.

Legal category POM.

Package quantities Cytosar is supplied as a vial of sterile powder 100 mg cytosine arabinoside in company with an ampoule containing 5 ml diluent (water for injection plus 0.9% w/v benzyl alcohol).

Further information Published work indicates that cytosar is effective in the indications for which it is commended. However, a greater treatment success has been achieved in certain studies by the combination of Cytosar with other agents. The literature should be referred to in determining whether this latter course of action should be considered.

Product licence number 0032/5037.

ALACIN C*

Presentation Hard-filled gelatine capsules (maroon/white) containing 150 mg clindamycin (as clindamycin hydrochloride).

Hard-filled gelatine capsules (lavender/white) containing 75 mg clindamycin (as clindamycin hydrochloride).

Pink, sucrose-based granules for paediatric suspension, with pineapple flavour. Each 5 ml reconstituted suspension contains 75 mg clindamycin (as clindamycin hydrochloride).

Uses Antibacterial. Serious infections caused by susceptible Gram-positive organisms, staphylococci (both penicillinase and non-penicillinase producing), streptococci (except *Strep. faecalis*), and pneumococci. It is also indicated in serious infections caused by susceptible aerobic pathogens.

Clindamycin does not penetrate the blood/brain barrier in therapeutically effective quantities.

Dosage and administration Oral. Absorption of clindamycin C is not appreciably modified by the presence of food.

Capsules: *Adults:* Moderately severe infection, 150–400 mg every six hours. Severe infection, 300–450 mg every six hours. Dalacin C Capsules should always be taken with a glass of water.

Paediatric: To each 100 ml bottle of granules add 74 ml water and shake.

Children: 3–6 mg/kg every six hours depending on the severity of the infection.

In children under one year or weighing 10 kg or less the minimum recommended dose is 2.5 ml (37.5 mg) every eight hours.

The following paediatric dose regime is recommended as a guide:

Moderately severe infection: 0–11 months: 3.5–9.0 kg: 2.5 ml every eight hours.

1–3 years: 10–15 kg: 2.5 ml every six hours.

4–7 years: 16–25 kg: 5 ml every six hours.

8–12 years: 26–38 kg: 7.5 ml every six hours.

Severe infection: 0–11 months: 3.5–9.0 kg: 2.5 ml every six hours.

1–3 years: 10–15 kg: 5 ml every six hours.

4–7 years: 16–25 kg: 7.5 ml every six hours.

8–12 years: 26–38 kg: 10 ml every six hours.

Adults: *Moderately severe infection:* 10 ml every six hours. *Severe infection:* 20 ml every six hours.

Note: In cases of β -haemolytic streptococcal infection, treatment with Dalacin C should continue for at least 10 days to diminish the likelihood of subsequent rheumatic fever or glomerulonephritis.

Contra-indications, warnings, etc

Contra-indications: Dalacin C is contra-indicated in patients previously found to be hypersensitive to this antibiotic. Although cross-sensitisation to lincomycin has not been demonstrated, it is recommended that Dalacin C is not used in patients who have demonstrated lincomycin sensitivity.

Warnings: Dalacin C should only be used in the treatment of serious infections. In considering the use of the product the practitioner should bear in mind the type of infection and the potential hazard of the diarrhoea which may develop since cases of colitis have been reported. The appearance of marked diarrhoea should be regarded as an indication that the product should be discontinued immediately.

Studies indicate a toxin(s) produced by *Clostridia* (especially *Clostridium difficile*) is the principal direct cause of antibiotic-associated colitis. These studies also indicate that this toxigenic *Clostridium* is usually sensitive in-vitro to vancomycin. When 125 mg to 500 mg of vancomycin is administered orally four times a day, there is a rapid observed disappearance of the toxin from faecal samples and a coincident clinical recovery from the diarrhoea.

Precautions: Care should be observed in the use of Dalacin C in atopic individuals, e.g. asthma and allergy.

Clindamycin has been shown to have neuromuscular blocking properties that may enhance the action of other neuromuscular blocking agents. Therefore it should be used with caution in patients receiving such agents.

Periodic liver function tests and blood counts should be carried out during prolonged therapy. Such monitoring is also recommended in neonates and infants. Safety and appropriate dosage in infants less than one month old have not been established.

The dosage of Dalacin C may require reduction in patients with renal or hepatic impairment due to prolongation of the serum half-life of the antibiotic.

Safety for use in pregnancy has not yet been established.

Overdosage: In cases of overdosage that may have led to adverse reactions, therapy should be discontinued and the usual emergency treatment, including corticosteroids, adrenaline and antihistamines, instituted. The serum biological half-life of clindamycin is 2.4 hours. Clindamycin cannot be readily removed from the blood by dialysis or peritoneal dialysis.

Side-effects: In general Dalacin C is well tolerated. Side-effects referable to the gastro-intestinal tract include abdominal discomfort, loose stools or diarrhoea or colitis (see 'Warnings'), nausea or occasional vomiting. Hyper-

sensitivity reactions are rare, even in patients sensitive to penicillins. A low incidence of skin rash has been observed. Dalacin C has been shown to be free from major toxicity; no direct relationship to ototoxicity, nephrotoxicity, neurotoxicity, liver disease or haematopoietic damage has been established.

Pharmaceutical precautions Dalacin C Paediatric Granules are stable at room temperature (18–25°C) for at least 24 months.

Following reconstitution the paediatric suspension is stable for up to two weeks at room temperature.

Where further dilution is required use purified water.

Legal category POM.

Package quantities 75 mg capsules in bottles of 16 and 100. 150 mg capsules in bottles of 16, 100 and 500. Paediatric granules to make 100 ml suspension.

Further information Rapid absorption gives peak serum levels within 45 minutes and such levels exceed the *in vitro* minimum inhibitory concentrations for most sensitive bacteria.

Clindamycin demonstrates cross-resistance with lincomycin. When tested by *in vitro* methods, some staphylococcal strains originally resistant to erythromycin rapidly developed resistance to clindamycin.

DALACIN C* PHOSPHATE STERILE SOLUTION

Presentation Clear colourless sterile solution of clindamycin phosphate containing the equivalent of 150 mg clindamycin base per ml.

Uses Antibacterial. Dalacin C Phosphate is indicated in serious infections caused by susceptible Gram-positive organisms, *staphylococci* (both penicillinase and non-penicillinase-producing), *streptococci* (except *S. faecalis*), and *pneumococci*. It is also indicated in serious infections caused by susceptible anaerobic pathogens, such as, *Bacteroides* spp., *Fusobacterium* spp., *Propionibacterium*, *Peptostreptococcus* spp. and microaerophilic streptococci.

Clindamycin does not penetrate the blood/brain barrier in therapeutically effective quantities.

Dosage and administration Dalacin C Phosphate must be diluted prior to IV administration (see Package Insert) and should be infused over at least 10–60 minutes.

Adults: Parenteral (IM or IV administration).

Serious infections: 600 mg–1.2 g/day in two, three or four equal doses.

More severe infections: 1.2–2.7 g/day in two, three or four equal doses.

Single IM injections of greater than 600 mg are not recommended nor administration of more than 1.2 g in a single one-hour infusion.

For more serious infections, these doses may have to be increased. In life-threatening situations doses as high as 4.8 g daily have been given intravenously to adults.

Alternatively, the drug may be administered in the form of a single rapid infusion of the first dose followed by continuous IV infusion.

For details of dilution and infusion rates see package insert.

Children (over 1 month of age): Parenteral (IM or IV administration).

Serious infections: 15–25 mg/kg/day in three or four equal doses.

More severe infections: 25–40 mg/kg/day in three or four equal doses.

In severe infections it is recommended that children be given no less than 300 mg/day regardless of body weight.

Note: In cases of β -haemolytic streptococcal infections treatment should continue for at least 10 days.

Contra-indications, warnings, etc

Contra-indications: Dalacin C Phosphate is contra-indicated in patients previously found to be hypersensitive to preparations containing clindamycin. Although cross-sensitisation to lincomycin has not been demonstrated, it is recommended that Dalacin C Phosphate should not be used in patients who have demonstrated lincomycin sensitivity.

Warnings: Dalacin C Phosphate should only be used in the treatment of serious infections. In considering the use of this product the practitioner should bear in mind the type of infection and the potential hazard of the diarrhoea that may develop since cases of colitis have been reported. The appearance of marked diarrhoea should be regarded as an indication that the drug should be discontinued immediately.

Studies indicate a toxin(s) produced by *Clostridi*, (especially *Clostridium difficile*) is the principal direct cause of antibiotic-associated colitis. These studies also indicate that this toxigenic *Clostridium* is usually sensitive *in vitro* to vancomycin. When 125 mg to 500 mg of vancomycin is administered orally four times a day, there is a rapid observed disappearance of the toxin from faecal samples and a coincident clinical recovery from the diarrhoea.

Precautions: Care should be observed in the use of Dalacin C Phosphate in atopic individuals, e.g. asthma and allergy.

Periodic liver function tests and blood counts should be carried out during prolonged therapy. Such monitoring is also recommended in neonates and infants. Safety and appropriate dosage in infants less than one month old have not been established.

The dosage of Dalacin C Phosphate may require reduction in patients with renal or hepatic impairment due to prolongation of the serum half-life of the drug.

Safety for use in pregnancy has not yet been established.

Clindamycin has been shown to have neuromuscular blocking properties that may enhance the action of other neuromuscular blocking agents. Therefore, it should be used with caution in patients receiving such agents.

Side-effects: In general Dalacin C Phosphate is well tolerated. Side-effects referable to the gastro-intestinal tract include abdominal discomfort, loose stools, diarrhoea or colitis (see Warnings), nausea or occasional vomiting. Hypersensitivity reactions are rare, even in patients sensitive to penicillins though a few cases of anaphylactoid reactions have been reported. A low incidence of skin rash has been observed.

Jaundice and abnormalities in liver function tests have been observed during clindamycin therapy. Transient neutropenia (leukopenia) and eosinophilia have been

orted, and occasional reports of agranulocytosis and myelocytopenia have been made.

ain, induration and sterile abscess have been reported after intramuscular injection and thrombophlebitis afteravenous infusion. Reactions can be minimised or avoided by giving deep IM injections and avoiding prolonged use of indwelling intravenous catheters.

Dosage: In cases of overdosage that may have led to adverse reactions, therapy should be discontinued and the usual emergency treatment, including corticosteroids, adrenaline and antihistamines, instituted. The human biological half-life of clindamycin is 2.4 hours. Clindamycin cannot be readily removed from the blood by dialysis or peritoneal dialysis.

Pharmaceutical precautions In vitro compatibility studies monitored for 24 hours at room temperature show a concentration no greater than 6 mg/ml have demonstrated no inactivation or physical incompatibility with the use of Dalacin C Phosphate in IV solutions containing sodium chloride, glucose or potassium usually used clinically.

The following drugs are physically incompatible with Dalacin C Phosphate: ampicillin, diphenylhydantoin, bitarates, aminophylline, calcium gluconate and magnesium sulphate.

Compatibility or incompatibility with other drugs besides the ones already mentioned has not been determined.

Store at room temperature. Avoid refrigeration.

Pharmaceutical category POM.

Package quantities 5 × 2 ml and 5 × 4 ml ampoules.

Further information Biologically inactive clindamycin phosphate is rapidly converted to active clindamycin following injection.

By the end of short-term intravenous infusion, peak serum levels of active clindamycin are reached. Biologically inactive clindamycin phosphate disappears rapidly from the serum; the average disappearance half-life is six minutes. However, the serum disappearance half-life of active clindamycin is about three hours in adults and two and a half hours in children.

Clindamycin demonstrates cross-resistance with lincomycin. When tested by in vitro methods some staphylococcal strains originally resistant to erythromycin rapidly developed resistance to clindamycin.

Product licence number 0032/0042.

EPO-MEDRONE®

Presentation White, sterile aqueous suspension for injection containing 40 mg per ml methylprednisolone acetate.

Uses Corticosteroid (glucocorticoid), Depo-Medrone is indicated in conditions requiring a glucocorticoid effect, e.g. anti-inflammatory, anti-allergic, anti-rheumatic.

Dosage and administration Depo-Medrone should not be mixed with any other suspending agent or solution. Depo-Medrone may be used by any of the following routes: intramuscular, intra-articular, peritendinous, intrabursal, peribursal, intralesional, into the tendon sheath and rectal.

Intramuscular – for sustained systemic effect:

Allergic conditions (hay fever, asthma, rhinitis, drug reactions), 80–120 mg (2–3 ml).

Dermatological conditions (atopic, contact and seborrhoeic dermatitis), 40–120 mg (1–3 ml).

Collagen diseases (rheumatoid arthritis, SLE), 40–120 mg (1–3 ml) per week.

Adrenogenital syndrome, 40 mg (1 ml) every two weeks.

Note: Depo-Medrone is not intended for the prophylaxis of hay fever or other seasonal allergies and should be administered only when symptoms are present.

The frequency of intramuscular injections should be determined by the duration of clinical response.

On average the effect of a single 2 ml (80 mg) injection may be expected to last approximately two weeks.

In the case of seasonal allergic rhinitis a single injection is frequently sufficient. If necessary, however, a second injection may be given after two to three weeks.

Intra-articular: Rheumatoid arthritis, osteoarthritis. The dose of Depo-Medrone depends upon the size of the joint and the severity of the condition. Repeated injections, if needed, may be given at intervals of one to five or more weeks depending upon the degree of relief obtained from the initial injection. A suggested dosage guide is: large joint (knee, ankle, shoulder), 20–80 mg (0.5–2 ml); medium joint (elbow, wrist), 10–40 mg (0.25–1 ml); small joint (metacarpophalangeal, interphalangeal, sternoclavicular, acromioclavicular), 4–10 mg (0.1–0.25 ml).

Intrabursal: Subdeltoid bursitis, prepatellar bursitis, olecranon bursitis. For administration directly into bursae, 4–30 mg (0.1–0.75 ml). In most acute cases, repeat injections are not needed.

Intralesional: Localised neurodermatitis, hypertrophic lichen planus, nummular eczema, necrobiosis lipoidica diabetorum, alopecia areata, discoid lupus erythematosus and insect bites. For administration directly into the lesion for local effect in dermatological conditions, 20–60 mg (0.5–1.5 ml). For large lesions, the dose may be distributed by repeated local injections of 20–40 mg (0.5–1 ml). One to four injections are usually employed. Care should be taken to avoid injection of sufficient material to cause blanching, since this may be followed by a small slough.

Periarticular: Epicondylitis. Infiltrate 4–30 mg (0.1–0.75 ml) into the affected area.

Into the tendon sheath: Tendinitis, tenosynovitis, epicondylitis. For administration directly into the tendon sheath, 4–30 mg (0.1–0.75 ml). In recurrent or chronic conditions, repeat injections may be necessary.

Rectal: Ulcerative colitis, 40–120 mg (1–3 ml). Administer in retention enemas or by continuous drip in 30–300 ml of water, three to seven times weekly for two or more weeks.

Special precautions should be observed when administering Depo-Medrone. Intramuscular injections should be made deeply into the gluteal muscles. The usual technique of aspirating prior to injection should be employed to avoid intravascular administration. Doses recommended for intramuscular injection must not be administered superficially or subcutaneously. Skin depression at the site of injection due to atrophic changes in the subcutaneous tissues has occasionally been reported following administration of corticosteroids. Intravenous injections should be carefully made using precise anatomical localisation. In the treatment of tendinitis care should be taken to inject Depo-Medrone into the tendon sheath rather than into the substance of the tendon.

Contra-indications, warnings, etc

Contra-indications: The usual contra-indications to the systemic or local use of corticosteroids should be observed. These include; latent, healed and active tuberculosis, peptic ulcer, acute psychoses, Cushing's syndrome, herpes simplex keratitis, vaccinia and varicella.

Warnings: Depo-Medrone *must not* be given by the intravenous route. Because of its inhibitory effect on fibroplasia, methylprednisolone may mask signs of infection and enhance dissemination of the infecting organism. Hence all patients receiving methylprednisolone should be watched for evidence of intercurrent infection. Should infection occur it must be brought under control by the use of appropriate antibacterial therapy, or administration of corticosteroids should be discontinued.

Injections of Depo-Medrone should be made only under aseptic conditions. At times of stress it may be necessary to increase the systemic dose when long-term therapy is involved.

Due to the absence of a true tendon sheath, the Achilles tendon should not be injected with Depo-Medrone.

Precautions: The presence of diabetes, osteoporosis, chronic psychotic reactions, predisposition to thrombophlebitis, hypertension, congestive heart failure, renal insufficiency and the presence of infection necessitate the carefully controlled use of methylprednisolone. While therapy with corticosteroids does not appear to be contra-indicated during pregnancy, caution is recommended, particularly during the first trimester. Also neonates of mothers who received such therapy during pregnancy should be observed for signs of hypoadrenalism and appropriate measures instituted if such signs exist.

Side-effects: Side-effects associated with the use of corticosteroids may be observed, including 'Cushing's syndrome, moon facies, supraclavicular pads of fat, hirsutism, striae and acne, hyperglycaemia, osteoporosis, peptic ulceration, hypertension, psychic disturbance, posterior subcapsular cataracts, suppression of growth in children, subcutaneous and cutaneous atrophy, sterile abscess, vertigo, weakness, myopathy, thrombo-embolism, pancreatitis, exophthalmos and headache.

Overdosage: No known antidote. Following overdosage the possibility of adrenal suppression should be guarded against by gradual diminution of dose levels over a period of time. In such event the patient may require to be supported during any further traumatic episode.

Pharmaceutical precautions Depo-Medrone should be protected from freezing.

Depo-Medrone should not be mixed with any other fluid.

Legal category POM.

Package quantities 1 ml, 2 ml and 5 ml rubber-capped vials packed singly and as 6-vial clinic packs, and a 2 ml pre-filled disposable syringe.

Further information Methylprednisolone, has achieved a clinically acceptable split between glucocorticoid effect and undesired mineralocorticoid effect. Methylprednisolone has five times the anti-inflammatory activity of hydrocortisone but has little tendency to cause salt and water retention. Depo-Medrone affords

advantages in treatment which include high concentration in low fluid volume, greater gastric tolerance avoidance of the GI tract and complete physician control of dosage.

Product licence numbers

2 ml syringe 0032/5015

Vials 0032/5038

DEPO-MEDRONE* WITH LIDOCAINE

Presentation White, sterile aqueous suspension injection containing 40 mg per ml methylprednisolone acetate and 10 mg per ml lidocaine hydrochloride.

Uses Corticosteroid (glucocorticoid). Depo-Medrone with Lidocaine is indicated in conditions requiring glucocorticoid effect: e.g. anti-inflammatory or an rheumatic. It is recommended for local use where a added anaesthetic effect would be considered advantageous.

Dosage and administration Depo-Medrone with Lidocaine should not be mixed with any other preparations as flocculation of the product may occur. Depo-Medrone with Lidocaine may be used by any of the following routes: intra-articular, peri-articular, intrabursal, and into the tendon sheath.

Intra-articular: Rheumatoid arthritis, osteoarthritis. The dose of Depo-Medrone with Lidocaine depends on the size of the joint and the severity of the condition. Repeated injections, if needed, may be given at intervals of one to five or more weeks depending upon the degree of relief obtained from the initial injection. A suggested dosage guide is: large joint (knee, ankle, shoulder) 0.1–2 ml (20–80 mg of steroid); medium joint (elbow, wrist) 0.25–1 ml (10–40 mg of steroid); small joint (metacarpophalangeal, interphalangeal, sternoclavicular, acromioclavicular) 0.1–0.25 ml (4–10 mg of steroid).

Peri-articular: Epicondylitis. Infiltrate 0.1–0.75 ml (4–30 mg of steroid) into the affected area.

Intrabursal: Subacromial bursitis, prepatellar bursitis, olecranon bursitis. For administration directly into bursa 0.1–0.75 ml (4–30 mg of steroid). In most acute cases repeat injections are not needed.

Into the tendon sheath: Tendinitis, tenosynovitis, epicondylitis. For administration directly into the tendon sheath, 0.1–0.75 ml (4–30 mg of steroid). In recurrent chronic conditions, repeat injections may be necessary.

For infants and children, the recommended dosage should be reduced, but dosage should be governed by the severity of the condition rather than by strict adherence to the ratio indicated by age or body weight.

Special precautions should be observed when administering Depo-Medrone with Lidocaine. Intrasyndov injections should be carefully made using precise anatomical localisation. In the treatment of tendinitis care should be taken to inject Depo-Medrone with Lidocaine into the tendon sheath rather than into the substance of the tendon.

Contra-indications, warnings, etc

Contra-indications: Hypersensitivity to any of the components of the preparation. Depo-Medrone with Lidocaine should not be used in patients who exhibit heart block. The usual contra-indications to the systemic local use of corticosteroids should be observed. These include; latent, healed and active tuberculosis, peptic ulcer, acute psychoses, Cushing's syndrome, herpes simplex keratitis, vaccinia and varicella.

arnings: Depo-Medrone with Lidocaine must not be given by the intravenous or intrathecal route. Because of its inhibitory effect on fibroplasia, methylprednisolone may mask signs of infection and enhance dissemination of the infecting organism. Hence, all patients receiving methylprednisolone should be watched for evidence of recurrent infection. Should infection occur it must be sought under control by the use of appropriate antibacterial therapy, or administration of corticosteroids should be discontinued.

Injections of Depo-Medrone with Lidocaine should only be made under strict aseptic techniques.

Due to the absence of a true tendon sheath, the Achilles tendon should not be injected with Depo-Medrone with Lidocaine.

Precautions: The presence of diabetes, osteoporosis, manic or psychotic reactions, predisposition to thrombophlebitis, hypertension, congestive heart failure, renal insufficiency and the presence of infection necessitate a carefully controlled use of methylprednisolone. While therapy with corticosteroids does not appear to be contraindicated during pregnancy, caution is recommended, particularly during the first trimester. Also, neonates of mothers who received such therapy during pregnancy should be observed for signs of hypoadrenalism and appropriate measures instituted if such signs exist.

Retardation of linear growth has been noted in children receiving corticosteroids for 6 months or longer, the retardation being roughly proportional to the dose. Following cessation of therapy, the growth rate may be accelerated. For this reason the growth of children receiving prolonged steroid therapy should be observed carefully.

Side effects: Side effects associated with the use of corticosteroids may be observed, including Cushing's syndrome, moon facies, supraclavicular pads of fat, striae, acne, hyperglycaemia, osteoporosis, peptic ulceration, hypertension, psychic disturbance, posterior subcapsular cataracts, suppression of growth in children, subcutaneous and cutaneous atrophy, sterile abscess, vertigo, weakness, myopathy, thromboembolism, pancreatitis, exophthalmos and headache.

Overdosage: In general no positive action is required to be taken. The patient should, however, be observed closely for possible adverse reactions and appropriate steps taken.

Pharmaceutical precautions Depo-Medrone with lidocaine should be protected from freezing. Depo-Medrone with Lidocaine should not be mixed with any other fluid.

Legal category POM.

Package quantities 2 ml rubber-capped vials and 10 x 1 ml vial clinic packs.

Further information Methylprednisolone has achieved a clinically acceptable split between glucocorticoid effect and undesired mineralocorticoid effect. Methylprednisolone has five times the anti-inflammatory activity of hydrocortisone but has little tendency to cause salt and water retention. Depo-Medrone with lidocaine affords advantages in treatment which include high concentration in low fluid volume, greater gastric tolerance in avoidance of the GI tract and complete physician control of dosage.

Product licence number 0032/0076

DEPO-PROVERA*

Presentation White, sterile aqueous suspension containing 50 mg/ml medroxyprogesterone acetate.

Uses Progestogen.

For treatment of endometriosis.

Short-term antifertility agent when an oral contraceptive is contra-indicated or considered inappropriate in the following circumstances: (a) for wives of men undergoing vasectomy, for protection until the vasectomy becomes effective; (b) in women who are being immunised against rubella, to prevent pregnancy during the period of activity of the virus.

Dosage and administration Doses should be given intramuscularly deeply into the gluteal muscle.

Endometriosis: 50 mg i.m. once a week or 100 mg i.m. every two weeks for six months or longer.

Short term anti-fertility agent:

1. For menstruating women a single injection of 150 mg i.m. should be given during the first three to five days of the menstrual cycle.

2. For puerperal women the injection should ideally be given during the first week after delivery, but may be given at any time in the first six weeks post partum. (N.B. For wives of men undergoing vasectomy a second injection of 150 mg i.m. three months after the first injection may be necessary in a small proportion of patients where the husband's sperm count has not fallen to zero.)

Contra-indications, warnings, etc

Contra-indications: Depo-Provera is contra-indicated in thrombophlebitis or history of pulmonary embolism, and liver dysfunction or disease. It is also contra-indicated in known or suspected malignancy of breast or genital organs.

Warnings: Whether administered alone or in combination with oestrogen, Depo-Provera should not be employed in patients with abnormal uterine bleeding until a definite diagnosis has been established and the possibility of genital malignancy eliminated.

Precautions: Animal studies show that Depo-Provera possesses adrenocorticoid activity. While such activity has not been observed in human subjects, patients receiving large doses of Depo-Provera continuously and for long periods should be observed closely.

Some instances of female foetal masculinisation, clitoral hypertrophy, have been observed on large doses.

This product has not been approved for long-term use as a contraceptive.

In long-term studies in the Beagle dog, Depo-Provera causes mammary nodules, a small number of which become malignant. The relevance of the dog observations for humans has not yet been established.

Side-effects: Clinically Depo-Provera is well tolerated. No significant untoward effects have been reported.

Delay in return to normal menstrual cycling and transient infertility lasting up to 18 months or occasionally longer may be observed in patients who have been on continuous therapy with Depo-Provera over a prolonged period.

Depo-Provera frequently causes disruption of the normal menstrual cycle and irregular vaginal bleeding or spotting may be experienced. The frequency of occurrence of this bleeding usually decreases with subsequent injections and after one year on treatment many women have amenorrhoea.

Overdosage: No positive action is required to be taken.

Pharmaceutical precautions Store at room temperature and protect from freezing. Do not mix with other agents.

Legal category POM.

Package quantities 1 ml, 3 ml and 5 ml vials.

Further information Provera is a potent progestational agent with very low toxicity. Depo-Provera is ideally suited to the patient with endometriosis in whom oestrogen or androgen treatment may be considered to offer too many drawbacks on grounds of intolerance or masculinisation.

The contraceptive effect of 150 mg i.m. Depo-Provera lasts approximately 90 days.

A 150 mg per ml strength of Depo-Provera is also available in a 3.3 ml vial for alternative indications.

Product licence number 0032/0056.

DEPO-PROVERA* ▼

Presentation White sterile aqueous suspension. Each 1 ml contains 150 mg medroxyprogesterone acetate.

Uses Progestogen. A proportion of certain classes of malignant tumours have been shown to respond to hormone administration or ablative hormonal surgery. These classes include carcinoma of endometrium, carcinoma of kidney and carcinoma of breast. Depo-Provera has been shown to be effective as adjunctive therapy in carcinoma of endometrium, carcinoma of kidney and carcinoma of breast in post-menopausal women.

Dosage and administration Doses should be given intramuscularly, deep into the gluteal muscle.

Endometrial or renal carcinoma: The normal initial dose lies in the range 400–1,000 mg per week, but doses in excess of 1,000 mg per day have been used without serious adverse effects. If improvement is noted within a few weeks or months and the disease appears stabilised, it may be possible to maintain the improvement with as little as 400 mg per month.

Breast carcinoma: The recommended schedule is 500 mg/day for 28 days. The patient should then be placed on a maintenance schedule of 500 mg twice weekly as long as the patient is responding to treatment.

Progression of disease at any time during therapy indicates treatment with Depo-Provera should be terminated, although response to hormonal therapy may not be evident until after at least 8–10 weeks of therapy.

Where large doses are being administered consideration should be given to dividing the dose between two separate sites.

Contra-indications, warnings, etc

Contra-indications: Depo-Provera is contra-indicated in thrombophlebitis or a history of pulmonary embolism and liver dysfunction or disease.

Warning: In the treatment of carcinoma of breast occasional cases of hypercalcaemia have been reported.

Precautions: Animal studies show that Depo-Provera possesses adrenocortical activity. This has also been reported in man, therefore patients receiving large doses continuously and for long periods should be observed closely. The administration of large doses to pregnant women has resulted in the observation of some instances of female foetal masculinisation.

Side-effects: Depending on the volume injected, some patients may be expected to show undesirable sequelae at the site of injection such as residual lump, change colour of skin or sterile abscess. Other adverse reactions noted, particularly with large doses, have been:

Breast: In a few instances breast tenderness or galactorrhoea has occurred.

Psychic: An occasional patient has experienced nervousness, insomnia, somnolence, fatigue or dizziness.

Skin and mucous membranes: Sensitivity reactions ranging from pruritus, urticaria, angioneurotic oedema to generalised rash and anaphylaxis have occasional been reported. Acne, alopecia or hirsutism have been reported in a few cases.

Gastro-intestinal: Rarely nausea has been reported. Jaundice has been noted in a few instances.

Overdosage: No positive action is required to be taken.

Pharmaceutical precautions Store at room temperature and protect from freezing. Do not mix with other agents. Discard any remaining contents after use.

Legal category POM.

Package quantities 3.3 ml vial.

Further information Provera is a potent progestational agent with very low toxicity. A 50 mg/ml strength of Depo-Provera is also available in 1, 3 and 5 ml vials for alternative indications.

Product licence number 0032/0082.

HALCION* ▼

Presentation Blue flat oval tablets scored on one side and imprinted Upjohn 17 on the other side, each containing 0.25 mg triazolam.

Pale lavender flat oval tablets scored on one side and imprinted Upjohn 10 on the other, each containing 0.125 mg triazolam (for geriatric use).

Uses Halcion is a hypnotic which can be administered effectively for short-term and intermittent use in patients with recurring insomnia and poor sleeping habits. As with all hypnotics, long-term use is not recommended. Halcion may also be used in the treatment of insomnia associated with anxiety states and emotional distress.

Dosage and administration The usual dose for adults is 0.25 mg before retiring. The initial dose for geriatric patients is 0.125 mg and this may be increased to 0.25 mg if necessary.

Contra-indications, warnings, etc

Contra-indications: Halcion is contra-indicated in patients with known hypersensitivity to benzodiazepines.

Warnings: As with all medicaments of this type, avoidance of alcohol in patients receiving Halcion is recommended since the individual response cannot be foreseen. Similarly, during its period of activity, Halcion may modify patients' reactions (driving, operating machinery) to a varying extent depending on dosages and individual susceptibility.

Precautions: In elderly and/or debilitated patients, it is recommended that treatment with Halcion be initiated at 0.125 mg to decrease the possibility of development of over-sedation, dizziness, or impaired co-ordination. Halcion is to be combined with other drugs having

known hypnotic properties or CNS depressant effects, consideration should be given to potential additive effects.

As with other benzodiazepines, caution should be exercised if the patient is in a depressed state or reveals evidence of a latent depression since these conditions may be intensified by hypnotic agents.

The usual precautions should be observed in patients with impaired renal or hepatic function.

Safety for use during pregnancy has not yet been established.

Use in Nursing Mothers: Human studies have not been performed; however, studies in rats have indicated that Halcion and its metabolites are secreted in milk. Therefore administration to nursing mothers is not recommended.

Safety and effectiveness in patients under the age of 8 have not been established.

Side-effects: Drowsiness, dizziness, light-headedness, confusion and impaired co-ordination have occurred. The incidence and severity of these pharmacological effects are generally dose-related. Severe sedation and impaired co-ordination are indicative of drug intolerance or overdose.

Adverse reactions: Headache has occurred in some patients. Less frequent adverse reactions which have been reported are taste alterations and depression. Adverse reactions which have been reported rarely are pruritus, skin rash, blurred vision, hiccups, palpitations, epigastric discomfort, diarrhoea, and burning eyes. As with other benzodiazepines, occasional cases of anterograde amnesia have been reported. Abnormal psychological reactions to most benzodiazepines have been reported. Rare behavioural adverse effects include paradoxical aggressive outbursts, excitement and the uncovering of depression with suicidal tendencies.

Overdose: Manifestations of Halcion overdose include extensions of its pharmacological activity, namely somnolence and hypnosis. As in all cases of drug overdose, respiration, pulse, and blood pressure should be monitored and supported by general measures when necessary. Immediate gastric lavage should be performed. Intravenous fluids should be administered and an adequate airway maintained.

Experiments in animals have indicated that cardiovascular collapse can occur with massive intravenous doses of Halcion (over 100 mg/kg, > 20,000 times the maximum daily human dose). This could be reversed with positive mechanical respiration and the intravenous infusion of noradrenaline or metaraminol. Other animal experiments have suggested that haemodialysis and forced diuresis are probably of little value.

Pharmaceutical precautions Keep container tightly closed and protect from light.

Legal category POM.

Package quantities Bottles of 100 and 500.

Further information Halcion has a relatively short biological half-life as do its metabolites. It does not cause enzyme induction in man. The preponderance of data from sleep laboratory studies indicates that there would be no significant tolerance development, drug accumulation or withdrawal effects after cessation of treatment.

0.125 Tablet 0032/0063

KAOPTECTATE*

Presentation Off-white suspension. Each 5 ml contains 1.03 g Kaolin BP in an aromatic and carminative vehicle.

Uses Antidiarrhoeal.

Diarrhoea of non-specific origin.

Dosage and administration Oral.

Adult: 30–120 ml after each bowel movement.

Children: 5 ml or more according to age after each bowel movement.

Contra-indications, warnings, etc

Contra-indications: Intestinal obstruction.

Warnings: None.

Precautions: None.

Side-effects: None.

Overdose: None.

Pharmaceutical precautions None.

Legal category GSL.

Package quantities Bottles of 500 ml.

Further information Nil.

Product licence number 0032/5040.

LINCOCIN*

Presentation Capsules (dark blue/light blue) containing 500 mg lincomycin as lincomycin hydrochloride.

Colourless sterile solution. Contains 300 mg per ml lincomycin as lincomycin hydrochloride.

Red syrup with raspberry flavour. Each 5 ml contains 250 mg lincomycin as lincomycin hydrochloride.

Uses Antibacterial.

Lincomycin is indicated in serious infections caused by susceptible Gram-positive organisms, staphylococci (both penicillinase and non-penicillinase producing), streptococci (except *Strep. faecalis*) and pneumococci. It is also indicated (given parenterally) in serious infections caused by susceptible anaerobic pathogens.

Lincomycin does not penetrate the blood/brain barrier in therapeutically effective quantities.

Dosage and administration Oral. Intramuscular. Intravenous.

Oral:

Capsules: Adults: Moderately severe infections, 1 capsule three times a day. Severe infection, 1 capsule four times a day.

Syrup 250: Children 1–6 months: 1.25–2.5 ml three times a day.

6 months to 2 years: 2.5–5 ml three times a day.

3–9 years: 2.5–5 ml four times a day.

10–12 years: 5–10 ml four times a day.

For optimal absorption, it is recommended that nothing be given by mouth except water for a period of one or two hours before and after oral administration.

Intramuscular: Sterile solution. Injections should be made deeply into the gluteal muscles.

Adults: Moderately severe infection, 600 mg (2 ml) every 24 hours. Severe infection, 600 mg (2 ml) every 12 hours or more often.

Children (over 1 month): Moderately severe infection,

10 mg/kg/every 24 hours. Severe infection, 10 mg/kg/every 12 hours or more often.

Intravenous: Sterile solution.

Adults: 600 mg (2 ml) every 8–12 hours. Administer as an infusion in 250 ml or more 5% glucose or normal saline over a period of not less than one hour.

Children (over 1 month): 10–20 mg/kg/day in 2 or 3 equal doses at 8- or 12-hour interval. Administer as an infusion as above.

Treatment for infections caused by β -haemolytic streptococci should be continued for at least 10 days to guard against subsequent rheumatic fever or glomerulonephritis.

Contra-indications, warnings, etc

Contra-indications: Patients with a history of sensitivity to lincomycin. Although cross-sensitisation to clindamycin (Dalacin C) has not been demonstrated, it is recommended that Lincocin is not used in patients who have exhibited sensitivity to clindamycin.

Warnings: Lincocin should only be used in the treatment of serious infections. In considering the use of the product the practitioner should bear in mind the type of infection and the potential hazard of the diarrhoea which may develop since cases of colitis have been reported. The appearance of marked diarrhoea should be regarded as an indication that the product should be discontinued immediately.

Studies indicate a toxin(s) produced by *Clostridia* (especially *Clostridium difficile*) is the principal direct cause of antibiotic-associated colitis. These studies also indicate that this toxigenic *Clostridium* is usually sensitive in vitro to vancomycin. When 125 mg to 500 mg of vancomycin is administered orally four times a day, there is a rapid observed disappearance of the toxin from faecal samples and a coincident clinical recovery from the diarrhoea.

Precautions: Pending further clinical experience Lincocin is not recommended in the newborn, in the prophylaxis of a recurrence of rheumatic fever, and in patients with pre-existing kidney, liver, endocrine or metabolic disease, unless special clinical circumstances so indicate. Lincomycin has been shown to have neuromuscular blocking properties that may enhance the action of other neuromuscular blocking agents. Therefore it should be used with caution in patients receiving such agents. In the case of renal impairment, a reduced dosage regime should be used. During prolonged Lincocin therapy, periodic liver function studies and blood counts should be performed. Although there is no evidence of ill effects in either the mother or foetus, Lincocin should be used with customary caution in pregnant women.

The long-term use of lincomycin may give rise to an overgrowth of non-susceptible organisms, particularly yeasts.

Side-effects: Lincocin is well tolerated. With oral administration, gastro-intestinal side-effects have been encountered, such as loose stools or diarrhoea, or colitis (see 'Warnings'), nausea, vomiting and abdominal cramps. Other minor side-effects have been observed infrequently. Leucopenia (neutropenia), agranulocytosis and hypersensitivity reactions have been reported on rare occasions.

Overdosage: In cases of overdosage that may have led to adverse reactions therapy should be discontinued and the usual emergency treatment, including corticosteroids, adrenaline and antihistamines, instituted. The

serum biological half-life of lincomycin is 5.4 ± 1 hr. Lincomycin cannot be readily removed from the blood by dialysis or peritoneal dialysis.

Pharmaceutical precautions Storage temperature for capsules should not exceed 30°C. Lincocin Sterile Solution should be protected from light and freezing and stored at under 30°C.

Dilution of the Syrup 250 should be carried out using Syrup BP.

Legal category POM.

Package quantities Capsules in bottles of 12 and 100.

Syrup 250, Bottles of 100 ml.

Sterile solution 2 ml and 10 x 2 ml ampoules.

Further information Lincomycin exhibits cross-resistance with clindamycin. When tested by in vitro methods, some staphylococcal strains originally resistant to erythromycin rapidly developed resistance to lincomycin.

LONITEN* ▼

Presentation Round white biconvex tablets with the dosage strength imprinted on one side and scored on the other with a U on either side of the score.

Each tablet contains 2.5 mg, 5 mg or 10 mg minoxidil.

Uses Loniten is indicated for the treatment of severe hypertension.

It should not be used as the sole agent to initiate therapy. It is a peripheral vasodilator and should be given in conjunction with a diuretic, to control salt and water retention, and a beta-adrenergic blocking agent, or appropriate substitute, to control reflex tachycardia.

Dosage and administration *Adults and patients over*

12 years of age: An initial daily dose of 5 mg, which may be given as a single or divided dosage is recommended. This dose may first be increased to 10 mg daily and subsequent increases should be by increments of 10 mg in the daily dose. Dosage adjustments should be made at intervals of not less than three days, until optimum control of blood pressure is achieved. It is seldom necessary to exceed 50 mg per day although in exceptional circumstances, doses up to 100 mg per day have been used. Twice-daily dosage is satisfactory. Where diastolic pressure reduction of less than 30 mm Hg is required, once-daily dosing has been reported as effective.

Dosage requirements may be lower in dialysis patients.

Children: For patients of 12 years of age or under, the initial dose should be 0.2 mg per kilogram given as a single or divided daily dosage. Incremental increases of 0.1–0.2 mg per kilogram in the daily dose are recommended at intervals of not less than three days until optimum blood pressure control has been achieved or the maximum daily dose of 1.0 mg/kg has been reached.

Rapid reduction of blood pressure: Rapid reduction of blood pressure can be achieved using continuous blood pressure monitoring and incremental doses of 5 mg every six hours.

Concomitant antihypertensive therapy: It is recommended that, where possible, antihypertensive therapy, other than a beta-adrenergic blocking agent and a diuretic, be discontinued before Loniten treatment is started. It is recognised that some antihypertensive agents should not be abruptly discontinued. These drugs could be gradually discontinued during the first week of Loniten treatment.

Loniten causes sodium retention and if used alone can result in several hundred milli-equivalents of salt being retained together with a corresponding volume of water. Therefore, in all patients who are not on dialysis, sodium must be given in conjunction with a diuretic in sufficient dosage to maintain salt and water balance. Examples of the daily dosages of diuretics commonly used when starting therapy with Loniten include:

1. Hydrochlorothiazide (100 mg) – or other thiazides of equivalent effective dosage.
2. Chlorthalidone (100 mg).
3. Furosemide (80 mg).

If excessive water retention results in a weight gain of more than 3 pounds when a thiazide or chlorthalidone is being used, diuretic therapy should be supplemented with spironolactone or changed to furosemide, the dosage of which may be increased in accordance with the patient's requirements. Diuretic dosage in children could be proportionally less in relation to weight.

Patients will require a sympathetic nervous system depressant to limit a Loniten-induced rise in heart rate. The preferred agent is a beta-blocker equivalent to an adult propranolol dosage of 80–160 mg/day. Higher doses may be required when pre-treated patients have an increase in heart rate exceeding 20 beats per minute when simultaneous introduction causes an increase exceeding 10 beats per minute. When beta-blockers are contra-indicated, alternatives such as methyldopa may be used instead and should be started 24 hours prior to Loniten.

Contra-indications, warnings, etc

Contra-indications: Loniten is contra-indicated in patients with a pheochromocytoma.

Warnings: If used alone, Loniten can cause a significant retention of salt and water leading to positive physical signs such as oedema, and to clinical deterioration of some patients with heart failure. Diuretic treatment alone, or in combination with restricted salt intake is, therefore, necessary for all patients taking Loniten.

Patients who have had myocardial infarction should not be treated with Loniten after a stable post-infarction state has been established.

The physician should bear in mind that if not controlled by sympathetic suppressants, the rise in cardiac rate and output that follows the use of potent vasodilators may induce anginal symptoms in patients with undiagnosed coronary artery disease, or may aggravate pre-existing angina pectoris.

The effect of Loniten may be additive to concurrent antihypertensive agents. The interaction of Loniten with sympathetic-blocking agents such as guanethidine or ethanidine may produce excessive blood pressure reduction and/or orthostasis.

Precautions: The safety of Loniten in pregnancy remains to be established.

Hypertrichosis occurs in most patients treated with Loniten and all patients should be warned of this possibility before starting therapy. Spontaneous reversal

to the pre-treatment state can be expected one to three months after cessation of therapy.

Soon after starting Loniten therapy approximately 60% of patients exhibit ECG alterations in the direction and magnitude of their T waves. Large changes may encroach on the ST Segment, unaccompanied by evidence of ischaemia. These asymptomatic changes usually disappear with continuing Loniten treatment. The ECG reverts to the pre-treatment state if Loniten is discontinued.

Pericardial effusion has been detected in patients treated with a Loniten-containing regime. A cause and effect relationship has not been established. Most effusions have either been present before Loniten was given, or occurred among uraemic patients. However, it is suggested that Loniten-treated patients should be periodically monitored for signs or symptoms of pericardial effusion and appropriate therapy instituted if necessary.

Salt and water retention in excess of 2 to 3 pounds may diminish the effectiveness of Loniten. Patients should therefore, be carefully instructed about compliance with diuretic therapy and a detailed record of body weight should be maintained.

Side-effects: Most patients receiving Loniten experience a diminution of pre-existing side-effects attributable to their disease or previous therapy. New events or side-effects likely to increase include peripheral oedema, associated with or independent of weight gain; increases in heart rate; hypertrichosis; and a temporary rise in creatinine and blood urea nitrogen. Gastro-intestinal intolerance, rash and breast tenderness are infrequently reported side-effects of Loniten therapy.

Overdosage: If exaggerated hypotension is encountered, it is most likely to occur in association with residual sympathetic nervous system blockade (guanethidine-like effects or alpha-adrenergic blockade). Recommended treatment is intravenous administration of normal saline. Sympathomimetic drugs, such as nor-adrenaline or adrenaline, should be avoided because of their excessive cardiac-stimulating action. Phenylephrine, angiotensin II and vasopressin, which reverse the effect of Loniten, should be used only if inadequate perfusion of a vital organ is evident.

Pharmaceutical precautions None.

Legal category POM.

Package quantities 2.5 mg, 5 mg, and 10 mg Loniten tablets supplied as bottles of 100.

Further information Loniten is a potent vasodilator which probably exerts its action after binding to the smooth muscle of the blood vessel wall. At least 90% of an oral dose is rapidly absorbed and the average plasma half-life in man is 4.2 hours. The clinical duration of action is up to 72 hours. Approximately 90% of administered drug is metabolised and excreted in the urine within 24 hours. Drug-related materials can be removed by dialysis.

MEDRONE*

Presentation Oval double-scored white tablet 4 mg methylprednisolone; oval double-scored pink tablet

2 mg methylprednisolone; oval double-scored white tablet marked 'Upjohn 73' 16 mg methylprednisolone.

Uses Anti-inflammatory agent.

Medrone is indicated for conditions requiring glucocorticoid activity, including collagen diseases, allergic diseases, certain dermatological conditions, acute and chronic ocular inflammatory diseases, certain leukaemias and lymphatic neoplastic diseases, ulcerative colitis, nephrosis, and various metabolic diseases responsive to corticosteroid treatment.

Dosage and administration Oral.

The dosage recommendations shown in the table are suggested initial daily doses and are intended as guides. The average total daily dose recommended should be given in 4 equally divided doses and given with meals and a snack at bedtime (excepting in alternate-day therapy when the minimum effective daily dose is doubled and given every other day at 8.00 a.m.)

The initial suppressive dose level is continued until a satisfactory clinical response is obtained, a period usually of three to seven days in the cases of rheumatic diseases (except for acute rheumatic carditis), allergic conditions affecting the skin or respiratory tract, and ocular inflammatory diseases. If a satisfactory response is not obtained in seven days, re-evaluation of the case to confirm the original diagnosis should be made. As soon as a satisfactory clinical response is obtained, the daily dose should be reduced gradually, either to termination of treatment in the case of acute conditions (e.g. seasonal asthma, exfoliative dermatitis, acute ocular inflammations) or to the minimal effective maintenance dose level in the case of chronic conditions (e.g. rheumatoid arthritis, systemic lupus erythematosus, bronchial asthma, atopic dermatitis). In chronic conditions, and in rheumatoid arthritis especially, it is important that the reduction in dosage from initial to maintenance dose levels be accomplished slowly. Decrements of not more than 2 mg at intervals of 7–10 days are suggested. In rheumatoid arthritis, maintenance steroid therapy should be at the lowest possible level.

In general, dosage for children should be based upon clinical response and is at the discretion of the clinician.

In alternate-day therapy, the minimum daily corticoid requirement is doubled and administered as a single dose every other day at 8.00 a.m.

Contra-indications, warnings, etc

Contra-indications: Medrone is contra-indicated in patients with latent, healed and active tuberculosis, Cushing's syndrome, peptic ulcer, acute psychoses, herpes simplex keratitis, vaccinia and varicella.

Warnings: Because of its inhibitory effect on fibroplasia, Medrone may mask signs of infection and enhance dissemination of the infecting organism. All patients should be watched for such intercurrent infection, which must be brought under control by use of appropriate antibacterial measures. As a general rule the administration of the corticosteroid should not be discontinued suddenly, but tailed off over a period. In certain situations involving intercurrent infection the corticosteroid dosage may require to be stepped up to counter the effects of shock.

Precautions: The presence of diabetes, osteoporosis, chronic psychotic reactions, predisposition to thrombophlebitis, hypertension, congestive heart failure and renal insufficiency necessitate the carefully controlled use of methylprednisolone. While therapy with cortico-

steroids during pregnancy does not appear to be contraindicated, caution is recommended, particularly during the first trimester. Neonates of mothers who have received such therapy during pregnancy should be observed for signs of hypoadrenalism and appropriate measures instituted if such signs are present.

Medrone should be used with caution in young children as corticosteroids are known to interfere with normal growth pattern.

Side-effects: Side-effects associated with the use of corticosteroids may be observed, including Cushing's syndrome, moon facies, supraclavicular pads of fat, hirsutism, striae and acne, hyperglycaemia, osteoporosis, peptic ulceration, hypertension, psychic disturbance, posterior subcapsular cataracts, suppression of growth in children, subcutaneous and cutaneous

<i>Indications</i>	<i>Recommended initial daily dosage</i>
<i>Collagen diseases</i>	
Rheumatoid arthritis	
Severe	12–16 mg
Moderately severe	8–12 mg
Moderate	4–8 mg
Children	4–8 mg
Systemic lupus erythematosus	20–96 mg
Acute rheumatic fever	1.1 mg per kg of body weight per day until ESR normal for one week
<i>Allergic diseases</i>	
Severe seasonal asthma	16–40 mg
Severe pollinosis	16–40 mg
Exfoliative dermatitis	16–40 mg
Contact dermatitis	16–40 mg
Severe intrinsic asthma	12–40 mg
Intractable allergic rhinitis	12–40 mg
Generalised atopic dermatitis	12–40 mg
Generalised infantile eczema	8–12 mg
<i>Ocular inflammatory diseases (of the posterior segment)</i>	
Acute	12–40 mg
Chronic	12–40 mg
<i>Haematological disorders</i>	
Acute granulocytic leukaemia	16–96 mg
Acute monocytic leukaemia	16–96 mg
Chronic lymphocytic leukaemia	16–96 mg
Thrombocytopenia	16–96 mg
Haemolytic anaemia	16–96 mg
	In some cases, doses of the order of 300 mg have been employed to establish control
<i>Miscellaneous diseases</i>	
Adrenogenital syndrome	4–12 mg
Ulcerative colitis	16–60 mg
Nephrosis	20–60 mg (for 10–14 days or until diuresis ensues)
Refractory congestive heart failure or cirrhosis of the liver with ascites	16–24 mg Medrone must be administered in conjunction with an effective diuretic

atrophy, sterile abscess, vertigo, weakness, myopathy, thrombo-embolism, pancreatitis, exophthalmos and headache.

Overdosage: Administration of Medrone should not be discontinued abruptly but tapered off over a period of time. Appropriate action should be taken to alleviate the symptoms produced by any side-effect that may become apparent. It may be necessary to support the patient with corticosteroids during any further period of trauma occurring within two years of overdosage.

Pharmaceutical precautions No special precautions are required.

Legal category POM.

Package quantities 2 and 4 mg tablets in bottles of 30 and 100.

16 mg tablets in bottles of 14.

Further information Medrone has achieved a clinically acceptable split between glucocorticoid effect and undesired mineralocorticoid effect. Weight for weight, methylprednisolone has five times the anti-inflammatory activity of hydrocortisone but has little tendency to cause salt and water retention. The 16 mg tablet gives opportunity for use of alternate-day therapy in long-term use in chronic conditions.

Medrone Tablets 2 mg	0032/5017
Medrone Tablets 4 mg	0032/5018
Medrone Tablets 16 mg	0032/0024

MEDRONE* ACNE LOTION

Presentation A pale yellow emulsion containing the following active ingredients (% w/v):

Methylprednisolone acetate	0.25%
Sulphur (from colloidal sulphur)	5%
Aluminium chlorhydroxide complex	10%

Uses For topical application in the treatment of acne vulgaris, rosacea and seborrhoeic dermatitis.

Dosage and administration Apply sparingly once or twice a day. Shake well before use.

Contra-indications, warnings, etc

Contra-indications: Contra-indications, warnings and precautions are those which normally apply to topical corticosteroids.

Warnings: Contact with the eyes should be avoided. Topical administration of corticosteroids to pregnant animals can cause abnormalities of foetal development. The relevance of this finding to human beings has not been established; however, topical steroids should not be used extensively in pregnancy, i.e. in large amounts or for prolonged periods.

Side-effects: Medrone Acne Lotion is designed to produce a drying effect on the skin. Should excessive drying or peeling of the skin occur, the frequency of application should be reduced. Other less frequently occurring side-effects include erythema, itching, burning, hyperpigmentation and occasional hypersensitivity or allergic reactions.

Overdosage: Unlikely to produce serious toxicity unless taken in very large amounts. Ingestion of 30 grams of aluminium chlorhydroxide complex has produced serious toxicity and an emetic should be considered, together with supportive therapy in such cases of massive ingestion.

Pharmaceutical precautions Protect from freezing. The lotion should not be diluted and should be dispensed in the original container.

Legal category POM.

Package quantities 25 ml and 75 ml polythene bottles.

Further information If infection is present the companion product Neo-Medrone Acne Lotion (which contains neomycin) is available.

Product licence number 0032/0041.

NEO-CORTEF* EYE/EAR DROPS NEO-CORTEF* EYE/EAR OINTMENT

Presentation White, sterile aqueous suspension containing hydrocortisone acetate 15 mg (1.5%) and neomycin sulphate 5 mg (0.5%) per ml. Yellow soft ointment containing hydrocortisone acetate 15 mg (1.5%) and neomycin sulphate 5 mg (0.5%) per gram.

Uses Inflammatory and infective ear and eye conditions susceptible to the action of the neomycin/hydrocortisone combination.

Such conditions include:

Eye: Phlyctenular keratoconjunctivitis, non-specific superficial keratitis, blepharitis, acne rosacea keratitis, allergic conjunctivitis, deep keratitis, sclerokeratitis, episcleritis, post-operative keratitis, post-operative and post-traumatic uveitis.

Ear: Otitis externa.

Dosage and administration *Drops:* Eye: 1 or 2 drops three or more times daily.

Ear: 1 or 2 drops in the external ear canal three or more times daily.

Ointment: Applications should be made one or more times daily.

Contra-indications, warnings, etc

Contra-indications: The presence of tuberculous, fungal and acute purulent infections of the eye, viral infections of the eye such as herpes simplex, vaccinia and varicella, and history of sensitivity to neomycin.

Warnings: Topical administration of corticosteroids to pregnant animals can cause abnormalities of foetal development. The relevance of this finding to human beings has not been established; however, topical steroids should not be used extensively in the first trimester of pregnancy, i.e. in large amounts or for prolonged periods. In infants, long-term continuous topical corticosteroid therapy, with or without occlusion, should be avoided due to possible adrenal suppression.

Precautions: Because of its inhibitory effect on fibroplasia, hydrocortisone may mask signs of infection and enhance dissemination of an infecting organism.

Side-effects: An incidence of sensitivity to neomycin has been reported in topical applications containing this antibiotic.

Overdosage: Unlikely to produce any serious toxic effects if ingested.

Pharmaceutical precautions None.

Legal category POM.

Package quantities Neo-Cortef Eye/Ear Drops supplied as 5 ml and 10 ml plastic squeeze bottles with applicator tip.

Neo-Cortef Eye/Ear Ointment is supplied in tubes of 3.9 g with applicator tip.

Further information Nil.

Neo-Cortef Eye/Ear Ointment 0032/5027

NEO-CORTEF* OINTMENT AND LOTION

Presentation *Ointment*: Off-white, greasy-based ointment containing 10 mg (1%) or 25 mg (2.5%) hydrocortisone acetate and 5 mg (0.5%) neomycin sulphate per gram.

Lotion: Milky-white lotion containing 10 mg (1%) hydrocortisone acetate and 5 mg (0.5%) neomycin sulphate per millilitre.

Uses Anti-inflammatory and antibacterial.

Neo-Cortef Ointment and Lotion are indicated for infected dermatoses and allergic skin conditions complicated by infections caused by organisms susceptible to the action of neomycin.

Dosage and administration *Topical application*: Apply a small amount one to three times daily.

Contra-indications, warnings, etc

Contra-indications: The presence of tuberculous, fungal or viral infections such as herpes simplex, vaccinia and varicella, and a history of sensitivity to neomycin.

Warnings: In infants, long-term continuous topical corticosteroid therapy, with or without occlusion, should be avoided due to the risk of possible adrenal suppression. Topical administration of corticosteroids to pregnant animals can cause abnormalities of foetal development. The relevance of this finding to human beings has not been established; however, topical steroids should not be used extensively in the first trimester of pregnancy, i.e. in large amounts or for prolonged periods.

Precautions: Because of its inhibitory effect on fibroplasia, hydrocortisone may mask signs of infection and enhance dissemination of an infecting organism.

Side-effects: An incidence of sensitivity to neomycin has been reported in topical applications containing this antibiotic.

Overdosage: Unlikely to produce any serious toxic effects if ingested.

Pharmaceutical precautions Store at room temperature.

Legal category POM.

Package quantities Neo-Cortef Ointment 1% in tubes of 5 g and 20 g, 2.5% in tubes of 20 g.

Neo-Cortef Lotion 1% in 15 ml plastic squeeze bottles.

Further information Nil.

NEO-MEDRONE* ACNE LOTION

Presentation Pale yellow lotion containing suspension of methylprednisolone acetate 2.5 mg, neomycin

sulphate 2.5 mg, sulphur 50 mg, aluminium chlor hydroxide complex 100 mg per ml of aqueous base.

Uses Neo-Medrone Acne Lotion is indicated for the treatment of acne vulgaris, rosacea and seborrhoeic dermatitis.

Dosage and administration Topical application to the affected area sparingly once or twice a day. Shake well before using.

Contra-indications, warnings, etc

Contra-indications: Contra-indications, warnings and precautions are those which normally apply to topical corticosteroids, and the product is contra-indicated in patients with a history of sensitivity to neomycin.

Warnings: Contact with the eyes should be avoided. Topical administration of corticosteroids to pregnant animals can cause abnormalities of foetal development. The relevance of this finding to human beings has not been established; however, topical steroids should not be used extensively in pregnancy, i.e. in large amounts or for prolonged periods.

Side-effects: Neo-Medrone Acne Lotion is designed to produce a drying effect on the skin. Should excessive drying or peeling of the skin occur, the frequency of application should be reduced. Other less frequently occurring side-effects include erythema, itching, burning, hyperpigmentation and occasional hypersensitivity or allergic reactions.

Overdosage: Unlikely to produce serious toxicity unless taken in very large amounts. Ingestion of 30 grams of aluminium chlorhydroxide complex has produced serious toxicity and an emetic should be considered, together with supportive therapy in such cases of massive ingestion.

Pharmaceutical precautions Store at room temperature. Protect from freezing.

Legal category POM.

Package quantities 25 ml and 75 ml plastic squeeze bottles.

Further information Neo-Medrone Acne Lotion should be used as an adjunct to usual skin cleansing or dietary recommendations.

Product licence number 0032/5032.

ORTHOXICOL* SYRUP

Presentation Syrup containing Orthoxine (methoxyphenamine hydrochloride) 338 mg, codeine phosphate 219 mg and sodium citrate 6.5 g per 100 ml. The rec syrup has a characteristic cherry flavour.

Uses Cough syrup.

Indicated in cough associated with the common cold bronchitis, bronchial asthma, tracheitis and laryngitis.

Dosage and administration Oral.

Adults and Children over 12 years: 5–10 ml every three to four hours as required.

Children: 6–12 years: 2.5–5 ml repeated every four hours as required

Contra-indications, warnings, etc

Contra-indications: A history of sensitisation to codeine or an adverse reaction to Orthoxine.

Warnings: The stated dose should not be exceeded.

Precautions: Whilst the dose of Orthoxine given is low, the usual precautions to the use of systemic sympathomimetic therapy should be observed.

Side-effects: In the occasional patient some dryness of the mouth and drowsiness may be experienced.

Overdosage: Dosage should be stopped and appropriate action taken to combat codeine overdosage.

Pharmaceutical precautions Store at room temperature.

Where dilution is required use Syrup BP.

Legal category P.

Package quantities Bottles of 500 ml.

Further information Orthoxicol Syrup depresses the cough reflex, liquefies tenacious mucus and affords some bronchodilatation.

Product licence number 0032/5041.

ORTHOXINE* HYDROCHLORIDE

Presentation White, scored tablet marked 'U' on opposite side, each tablet containing methoxyphenamine hydrochloride 100 mg.

Uses Sympathomimetic bronchodilator. Indicated in bronchial asthma, allergic rhinitis, acute urticaria, gastrointestinal allergy, allergic headaches and nocturnal leg cramps.

Dosage and administration Oral.

Adults: 50–100 mg every three to four hours.

Children: 25–50 mg every four to six hours.

Contra-indications, warnings, etc

Contra-indications: A history of adverse reaction to Orthoxine.

Warnings: The stated dose should not be exceeded.

Precautions: Use with caution in patients with hypertension, hyperthyroidism, acute coronary disease, cardiac decompensation and diabetes mellitus.

Adverse reaction: The sympathomimetic amines in general have vasopressor and cardio-acceleratory activity and may also produce psychomotor stimulation with associated insomnia and anxiety. Orthoxine, at normal daily dose levels, up to 500 mg, is relatively free from these effects.

Side-effects: Drowsiness, mouth dryness, nausea and dizziness have been reported.

Overdosage: Dosage should be stopped and action to counter symptoms of sympathomimetic overstimulation instituted if needed.

Pharmaceutical precautions None.

Legal category P.

Package quantities Bottles of 100.

Further information Onset of bronchodilatation occurs about 30 minutes after an initial dose and FEV₁ usually improves over the course of the next four to six hours.

Product licence number 0032/5042.

PROSTIN E2* STERILE SOLUTIONS

Presentation Colourless sterile solutions in ampoules containing 1 mg/ml or 10 mg/ml dinoprostone, Prostaglandin E₂, in ethanol.

Uses Oxytocic agent.

Indications for Prostin E2 are: induction of labour, foetal death in utero, therapeutic termination of pregnancy, missed abortion and hydatidiform mole.

Presentation:

1. 0.75 ml ampoule of a 1 mg/ml solution of dinoprostone in ethanol – for induction of labour and foetal death in utero (intravenous).

2. 0.5 ml ampoule of a 10 mg/ml solution of dinoprostone in ethanol – for therapeutic termination of pregnancy, missed abortion and hydatidiform mole (intravenous).

3. 0.5 ml ampoule of a 10 mg/ml solution of dinoprostone in ethanol (plus a 50 ml vial of saline diluent) – for therapeutic termination of pregnancy (extra-amniotic).

Dosage and administration Prostin E2 Sterile Solution may be administered by two routes, intravenous or extra-amniotic, depending on dose form and indication as shown above. *In each case the ampoule contents must be diluted before use and full instructions on method of dilution and dosage are given on the package insert which should be consulted prior to initiation of therapy.* The following is a guide to dosage:

1. *Prostin E2 1 mg/ml solution (in ethanol). Intravenous for induction of labour:* Dilute with normal saline or 5% dextrose according to the package insert to produce a 1.5 mcg/ml solution. The 1.5 mcg/ml solution is infused at 0.25 mcg/minute for 30 minutes and then maintained or increased. Cases of foetal death in utero may require higher doses. An initial rate of 0.5 mcg/minute may be used with stepwise increases, at intervals of not less than one hour.

2. *Prostin E2 10 mg/ml solution (in ethanol). Intravenous for therapeutic termination of pregnancy, missed abortion and hydatidiform mole:* Dilute with normal saline or 5% dextrose according to package insert to produce a 5 mcg/ml solution. The 5 mcg/ml solution is infused at 2.5 mcg/minute for 30 minutes and then maintained or increased to 5 mcg/minute. The rate should be maintained for at least four hours before increasing further.

3. *Prostin E2 10 mg/ml solution (in ethanol). Extra-amniotic for therapeutic termination of pregnancy:* Dilute with the 50 ml of diluent provided according to the package insert to produce a 100 mcg/ml solution. The 100 mcg/ml solution is instilled via a 12–14 French-gauge Foley catheter. Initial instillation is 1 ml, then, dependent on uterine response, 1 or 2 ml usually at two-hour intervals.

Contra-indications, warnings, etc

Contra-indications: There are no absolute contra-indications to the use of Prostin E2. However, its use is not recommended in the following circumstances:

1. Where the patient is sensitive to prostaglandins.
2. For patients in whom oxytocic drugs are generally contra-indicated or where prolonged contractions of the uterus are considered inappropriate, such as: cases with a history of Caesarean section or major uterine surgery; cases in which major degrees of cephalopelvic disproportion may be present; cases in which foetal malpresentation is present; cases in which there is clinical

suspicion or definite evidence of pre-existing foetal distress; cases in which there is a history of difficult labour and/or traumatic delivery; grand multiparae with six or more previous term pregnancies; cases with a history of pelvic inflammatory disease.

3. In therapeutic termination of pregnancy where known pelvic infection exists, unless adequate prior treatment has been instituted.

4. The extra-amniotic route should not be employed in the presence of cervicitis or vaginal infections.

Warnings: There is some evidence in animals of a low order of teratogenicity, therefore, if abortion does not occur or is suspected to be incomplete as a result of prostaglandin therapy, the appropriate treatment for complete evacuation of the uterus should be instituted in all instances.

Since prostaglandins may potentiate the effect of oxytocin it is recommended that the use of these drugs simultaneously or in sequence be carefully monitored.

The products are available only to hospitals and clinics with specialised obstetric units and should only be used where 24-hour resident medical cover is provided.

Precautions: Caution should be exercised in the administration of Prostin E2 in patients with: (i) glaucoma or raised intra-ocular pressure; (ii) asthma or a history of asthma.

In addition, in labour induction, cephalopelvic relationships should be carefully evaluated before use of Prostin E2. During use, uterine activity, foetal status and the progression of cervical dilatation should be carefully monitored to detect possible evidence of undesired responses, e.g. hypertonus, sustained uterine contractions or foetal distress. In cases where there is a known history of hypertonic uterine contractility or tetanic uterine contractions, it is recommended that uterine activity and the state of the foetus should be continuously monitored throughout labour. The possibility of uterine rupture should be borne in mind where high-tone myometrial contractions are sustained.

Side-effects: Clinical studies have not revealed any life-threatening adverse reactions. The incidence of side-effects is directly dose-related.

Nausea, vomiting and diarrhoea have been reported as commonly encountered at dose levels required to induce therapeutic termination of pregnancy by the intravenous route; however, these side-effects are markedly less frequent with doses used by either the extra-amniotic route for therapeutic termination of pregnancy, or intravenously for induction of labour. Transient vasovagal symptoms, including flushing, shivering, headache and dizziness, have been recorded. On intravenous use of Prostin E2 local tissue irritation and erythema have occurred.

No evidence of thrombophlebitis has been recorded and local tissue erythema at the infusion site has disappeared within two to five hours after infusion. A temporary pyrexia and elevated WBC are not unusual, but both have reverted after termination of infusion. In extra-amniotic therapy the possibility of local infection must be considered and appropriate therapy initiated if necessary.

Overdosage: Treatment of overdosage must be, at this time, symptomatic, as clinical studies with prostaglandin antagonists have not progressed to the point where recommendations may be made. However, the following guidelines are recommended.

If evidence of excessive uterine activity or side-effects

appear, the rate of infusion should be decreased discontinued.

In cases of massive overdosage resulting in extreme uterine hypertonus appropriate obstetric procedures are indicated.

Pharmaceutical precautions Prostin E2 Sterile Solutions (in ethanol) must be refrigerated at 4°C. The should be diluted before use only with the diluent stated. Diluted solutions should be used within 24 hours (48 hours for extra-amniotic).

Legal category POM.

Package quantities

1. Pack containing 1 × 0.75 ml ampoule of Prostin E2 Sterile Solution 1 mg/ml (IV induction).

2. Pack containing 1 × 0.5 ml ampoule of Prostin E2 Sterile Solution 10 mg/ml (IV termination).

3. Pack containing 1 × 0.5 ml ampoule of Prostin E2 Sterile Solution 10 mg/ml plus 50 ml diluent (E termination).

Further information Oral Prostin E2 Tablets are also available for the induction of labour.

Product licence numbers

0.75 ml ampoule (1 mg/ml i.v.)	0032/0020
0.5 ml ampoule (10 mg/ml i.v.)	0032/0021
0.5 ml ampoule (10 mg/ml e.a.)	0032/0026

PROSTIN E2* TABLETS

Presentation Prostin E2 tablets are presented as white, roughly rectangular tablets embossed on one side to resemble the letter 'U'. Each tablet contains 0.5 mg dinoprostone.

Uses Oxytocic agent. Prostin E2 tablets are indicated for the induction of labour when there are no foetal or maternal contra-indications.

Dosage and administration The dosage of Prostin E2 must be adapted to the patient's response and should always be maintained at the lowest level which will produce satisfactory uterine response. All doses should be taken with a small glass of water.

An initial dose of 0.5 mg (1 tablet) should be given. Thereafter, doses should be given hourly. The usual dose will be 0.5 mg (1 tablet), but if uterine activity is inadequate, 1 mg (2 tablets) may be given hourly until such time as adequate uterine activity is established. Thereafter it may be possible to reduce the dosage to 0.5 mg (1 tablet) hourly. It is recommended that a total single dose of 1.5 mg (3 tablets) not be exceeded.

Contra-indications, warnings, etc

Contra-indications: There are no absolute contra-indications to the use of Prostin E2. However, its use is not recommended in the following circumstances:

1. Where the patient is sensitive to prostaglandins.
2. For patients in whom oxytocic drugs are generally contra-indicated or where prolonged contractions of the uterus are considered inappropriate, such as:

Cases with a history of Caesarean section or major uterine surgery;

Cases in which major degrees of cephalopelvic disproportion may be present;

Cases in which there is clinical suspicion or definite evidence of pre-existing foetal distress;

Cases in which there is a history of difficult labour and/or traumatic delivery;

Grand multiparae with six or more previous term pregnancies.

3. Cases with a history of pelvic inflammatory disease.

Warnings: Since it has been found that prostaglandins may potentiate the effect of oxytocin, it is recommended that these drugs should not be used together, and, if used in sequence, that the patient's uterine activity should be carefully monitored.

The product is available only to hospitals, and clinics with specialised obstetric units and should only be used where 24-hour resident medical cover is provided.

Precautions: Caution should be exercised in the administration of Prostin E2 tablets for the induction of labour in patients with: (i) glaucoma or raised intra-ocular pressure; (ii) asthma or a history of asthma. In addition, labour induction, cephalopelvic relationships should be carefully evaluated before use of Prostin E2. During use, uterine activity, foetal status, and the progression of cervical dilatation should be carefully monitored to detect possible evidence of undesired responses, e.g. hypertonus, sustained uterine contractions, or foetal stress. In cases where there is a known history of hypertonic uterine contractility or tetanic uterine contractions, it is recommended that uterine activity and the state of the foetus should be continuously monitored throughout labour. The possibility of uterine rupture should be borne in mind where high-tone myometrial contractions are sustained.

Side-effects: Clinical studies have not revealed any life-threatening adverse reactions. The incidence of side-effects is directly dose-related. Nausea, vomiting and diarrhoea have been noted following oral administration of Prostin E2, but have seldom been severe enough to necessitate discontinuation of medication.

Verdosage: Uterine hypertonus or unduly severe uterine contractions have rarely been encountered, but might be anticipated to result from overdosage. In the rare instance where temporary discontinuation of therapy is not effective in reversing foetal distress or uterine hypertonus, prompt delivery is indicated. Treatment of overdosage must be, at this time, symptomatic, since clinical studies with prostaglandin antagonists have not progressed to the point where recommendations may be made. It is currently believed that vomiting produced by overdosage may act as a self-limiting factor in protecting the patient.

Pharmaceutical precautions Prostin E2 tablets have a shelf-life of two years when stored at 4°C. Store in a refrigerator. The tablets should be used within three months of opening the bottle.

Legal category POM.

Package quantities Prostin E2 tablets are packed in bottles of 10.

Further information The exact mode of action of the prostaglandins is not yet completely understood. Prostin E2 has been shown to have a local action on isolated uterine musculature and clinically its main action is oxytocic. However, unlike other oxytocics, Prostin E2 exhibits the capacity of the prostaglandins to influence uterine activity at any stage of gestation. Prostin E2 does not exhibit an antidiuretic effect. Other Prostin E2 dose forms are available for induction of labour and foetal death in utero (intravenous route), therapeutic termination of pregnancy (intravenous and extra-amniotic

routes), missed abortion and hydatidiform mole (intravenous route).

Product licence number 0032/0040.

PROSTIN E2* VAGINAL TABLETS

Presentation Prostin E2 Vaginal Tablets are presented as white biconvex capsule-shaped tablets debossed with 'UPJOHN' and '715' on one side. Each tablet contains 3 mg dinoprostone.

Uses Oxytocic. Prostin E2 Vaginal Tablets are indicated for the induction of labour, especially in patients with favourable induction features, when there are no foetal or maternal contra-indications.

Dosage and administration One tablet (3 mg) to be inserted high into the posterior fornix. A second tablet may be inserted after six to eight hours if labour is not established. Maximum dose 6 mg.

Contra-indications, warnings, etc

Contra-indications: There are no absolute contra-indications to the use of Prostin E2. However, its use is not recommended in the following circumstances.

1. For patients in whom oxytocic drugs are generally contra-indicated or where prolonged contractions of the uterus are considered inappropriate such as:

Cases with a history of Caesarian section or major uterine surgery;

Cases in which major degrees of cephalopelvic disproportion may be present;

Cases in which there is clinical suspicion or definite evidence of pre-existing foetal distress;

Cases in which there is a history of difficult labour and/or traumatic delivery;

Grand multiparae with six or more previous term pregnancies.

2. Patients with ruptured membranes.

3. Patients with known hypersensitivity to prostaglandin.

Warning: Since it has been found that prostaglandins may potentiate the effect of oxytocin, it is recommended that, if these drugs are used together or in sequence, the patient's uterine activity should be carefully monitored.

The product is available only to hospitals and clinics with specialised obstetric units.

Precautions: Caution should be exercised in the administration of Prostin E2 Vaginal Tablets for the induction of labour in patients with:

(i) glaucoma or raised intra-ocular pressure;

(ii) asthma or a history of asthma.

In addition, in labour induction, cephalopelvic relationships should be carefully evaluated before use of Prostin E2. During use, uterine activity, foetal status, and the progression of cervical dilatation should be carefully monitored to detect possible evidence of undesired responses, e.g. hypertonus, sustained uterine contractions, or foetal distress. In cases where there is a known history of hypertonic uterine contractility or tetanic uterine contractions, it is recommended that uterine activity and the state of the foetus should be continuously monitored throughout labour. The possibility of uterine rupture should be borne in mind where high-tone myometrial contractions are sustained. Animal studies lasting several weeks at high doses have shown that prostaglandins of the E and F series can induce

proliferation of bone. Such effects have also been noted in newborn infants who have received prostaglandin E₁ during prolonged treatment. There is no evidence that short-term administration of Prostin E2 Vaginal Tablets can cause similar bone effects.

Side Effects: Very occasional nausea and vomiting. Uterine hypertonus or unduly severe uterine contractions have rarely been encountered.

Overdosage: Treatment of overdosage must be, at this time, symptomatic, since clinical studies with prostaglandin antagonists have not progressed to the point where recommendations may be made.

Pharmaceutical precautions Prostin E2 Vaginal Tablets have a shelf-life of 24 months when stored in a refrigerator at 4°C. The tablets should be used within 1 month of opening the bottle.

Legal category POM.

Package quantities Prostin E2 Vaginal Tablets are packed in bottles of 4.

Further information Unlike other oxytocics, Prostin E2 exhibits the capacity of the prostaglandins to influence uterine activity at any stage of gestation. Other Prostin E2 dosage forms are available for induction of labour (oral and i.v. routes), foetal death in utero (i.v. route), therapeutic termination of pregnancy (i.v. and extra-amniotic routes), missed abortion and hydatidiform mole (i.v. route).

Product licence number 0032/0074.

PROSTIN F2 alpha* STERILE SOLUTIONS

Presentation Colourless, sterile aqueous solution containing 5 mg per ml dinoprost (Prostaglandin F₂ alpha). Dinoprost is presented as the tromethamine (THAM) salt.

1. Prostin F2 alpha Sterile Solution 5 mg/ml, 1.5 ml ampoule (intravenous).
2. Prostin F2 alpha Sterile Solution 5 mg/ml, 4 ml and 8 ml ampoules (intra-amniotic).
3. Prostin F2 alpha Sterile Solution 5 mg/ml, 5 ml ampoule (intravenous).

Uses Oxytocic agent. Prostin F2 alpha is indicated for induction of labour, foetal death in utero, therapeutic termination of pregnancy, missed abortion and hydatidiform mole.

Dosage and administration Prostin F2 alpha may be administered by the intravenous and intra-amniotic routes as follows:

1. Intravenous: for induction of labour and foetal death in utero.
2. Intra-amniotic: for therapeutic termination of pregnancy during the second trimester.
3. Intravenous: for therapeutic termination of pregnancy, missed abortion and hydatidiform mole.

For each route of administration except the intra-amniotic route, the ampoule contents must be diluted before use and full instructions on method of dilution and dosage are given on the package insert which should be consulted prior to initiation of therapy. The dose of Prostin F2 alpha used normally depends not only upon the indication but also on patient response. Increase in

dosage above that recommended is possible but may produce excessive uterine activity and be governed by the unacceptable appearance of dose-related side effects, such as nausea and vomiting.

The following is a guide to dosage:

1. *Prostin F2 alpha 5 mg/ml (1.5 ml ampoule) intra venous for induction of labour and foetal death in utero*: 15 mcg/ml solution is infused at 2.5 mcg/minute for at least 30 minutes and then maintained or increased. Case of foetal death in utero may require higher doses than those given above. An initial rate of 5 mcg/minute may be used with step-wise increases, at intervals of not less than one hour.
2. *Prostin F2 alpha 5 mg/ml (4 and 8 ml ampoules intra-amniotic for therapeutic termination of pregnancy*: 8 ml of undiluted solution (40 mg initial dose) should be withdrawn from the ampoule(s) and should be injected slowly into the amniotic sac.
3. *Prostin F2 alpha 5 mg/ml (5 ml ampoule) intra venous for therapeutic termination of pregnancy, missed abortion and hydatidiform mole*: 50 mcg/ml solution is infused at 25 mcg/minute for at least 30 minutes and then maintained or increased to 50 mcg/minute. This rate should be maintained for at least four hours before increasing further.

Contra-indications, warnings, etc

Contra-indications: There are no absolute contra-indications to the use of Prostin F2 alpha. However, its use is not recommended in the following circumstances:

1. Where the patient is sensitive to prostaglandins.
2. For patients in whom oxytocic drugs are generally contra-indicated or where prolonged contractions of the uterus are considered inappropriate, such as: cases with a history of Caesarean section or major uterine surgery cases in which major degree of cephalopelvic disproportion may be present; cases in which foetal malpresentation is present; cases in which there is clinical suspicion or definite evidence of pre-existing foetal distress; cases in which there is a history of difficult labour and/or traumatic delivery; grand multiparae with six or more previous term pregnancies; cases with a history of pelvic inflammatory disease.
3. In therapeutic termination of pregnancy where known pelvic infection exists, unless adequate prior treatment has been instituted.
4. The intra-amniotic route should not be employed in patients with a history of Caesarean section or prior major uterine surgery.

Warnings: There has been some evidence in animals of a low order of teratogenic activity, therefore, if abortion does not occur or is suspected to be incomplete as a result of prostaglandin therapy, the appropriate treatment for complete evacuation of the pregnant uterus should be instituted in all instances. Since it has been found that prostaglandins may potentiate the effect of oxytocin, it is recommended that these drugs should not be used together, and if used in sequence, that the patient's uterine activity should be carefully monitored.

The products are available only to hospitals and clinics with specialised obstetric units and should only be used where 24-hour resident medical cover is provided.

Precautions: Caution should be exercised in the administration of Prostin F2 alpha for induction of labour or therapeutic termination of pregnancy in patients with (i) glaucoma or raised intra-ocular pressure; (ii) asthma or history of asthma. In addition, in labour induction

5 ml ampoule	0032/0038

PROSTIN VR* STERILE SOLUTION ▼

Presentation Ampoule containing 0.5 mg alprostadil in 1 ml dehydrated ethanol.

Uses Prostin VR is indicated to temporarily maintain the patency of the ductus arteriosus until corrective or palliative surgery can be performed in infants who have congenital defects and who depend upon the patent ductus for survival. Such congenital heart defects include pulmonary atresia, pulmonary stenosis, tricuspid atresia, tetralogy of Fallot, interruption of the aortic arch, coarctation of the aorta, aortic stenosis, aortic atresia, mitral atresia, or transposition of the great vessels with or without other defects.

Dosage and administration For administration by intravenous drip or constant-rate infusion pump.

In infants with lesions restricting pulmonary blood flow (blood is flowing through the ductus arteriosus from the aorta to the pulmonary artery), Prostin VR may be administered by continuous infusion through an umbilical artery catheter placed at or just above the junction of the descending aorta and the ductus arteriosus, or intravenously. Adverse effects have occurred with both routes of administration, but the types of reactions are different. A higher incidence of flushing has been associated with intra-arterial than with intravenous administration.

Infusion should begin with 0.1 micrograms alprostadil per kilogram of body weight per minute. If the aorta can not be catheterised via the umbilical artery, the infusion may be given through a catheter advanced from the periphery into a larger vein.

In infants with lesions restricting systemic blood flow (blood is flowing through the ductus arteriosus from the pulmonary artery to the aorta), Prostin VR may be administered by continuous infusion through an umbilical artery catheter passed across the ductus arteriosus and into the pulmonary artery proximal to the ductus arteriosus, or intravenously. Infusion should begin with 0.1 micrograms alprostadil per kilogram of body weight per minute. If the pulmonary artery can not be catheterised via the umbilical artery, the infusion may be given through a catheter advanced from the periphery into a large vein.

When an effect is achieved, decrease the infusion to the lowest possible dose while maintaining the desired effects.

Dilution Instructions: To prepare infusion solutions, dilute 1 ml of Prostin VR Sterile Solution with sterile 0.9% Sodium Chloride Intravenous Infusion or sterile 5% Dextrose Intravenous Infusion. Dilute to volumes appropriate for the delivery system available. Prepare fresh infusion solutions every 24 hours. Discard any solution more than 24 hours old.

Examples: Dissolve 1 ml Prostin VR Sterile Solution (500 micrograms alprostadil) in 25 to 100 ml sterile 0.9% Sodium Chloride Intravenous Infusion or sterile 5% Dextrose Intravenous Infusion to provide a solution containing 500 micrograms alprostadil. The infusion rate can be calculated as follows:

Infusion rate (ml/hr) =

$$\frac{\text{Vol. containing 500 mcg alprostadil} \times \text{body weight (kg)}}{83.3}$$

With an infusion pump limited to discrete infusion rates, infuse 2 or 4 ml per hour. Calculate the volume of 0.9% saline or 5% dextrose to add to 1 ml Prostin VR Sterile Solution to deliver 0.1 micrograms alprostadil per kilogram of body weight per minute at the chosen pump rate as follows:

$$\text{Volume of saline or dextrose needed (ml)} = \frac{\text{Pump rate (ml/hour)} \times 83.3}{\text{body weight (kg)}} - 1$$

The infusion solution may be mixed conveniently in a graduated mixing chamber inserted between the IV bottle and the pump.

Change the dosage from 0.1 micrograms per kilogram of body weight per minute to 0.05 micrograms per kilogram of body weight per minute by reducing the pump rate to one-half the original rate.

PARTICULAR CARE SHOULD BE TAKEN IN CALCULATING AND PREPARING DILUTIONS OF PROSTIN VR

Contra-indications, warnings, etc

Contra-indications: None.

Warnings: Only the recommended Prostin VR dosages should be administered and only by medically trained personnel in hospitals or other facilities with immediately available intensive care.

Approximately 10–12% of neonates with congenital heart defects treated with Prostin VR Sterile Solution (alprostadil) experienced apnoea. Apnoea is most often seen in neonates weighing less than 2 kg at birth and usually appears during the first hour of drug infusion. Therefore, Prostin VR Sterile Solution should be used where ventilatory assistance is immediately available.

Precautions: Prostin VR Sterile Solution (alprostadil) should be infused for the shortest time and at the lowest dose which will produce the desired effects. The risk of long-term infusion of Prostin VR should be weighed against the possible benefits that critically ill infants may derive from its administration.

Cortical proliferation of the long bones has followed long-term infusions of alprostadil in infants and dogs. The proliferation in infants regressed after withdrawal of the drug.

Use Prostin VR Sterile Solution (alprostadil) cautiously in neonates with histories of bleeding tendencies.

Care should be taken to avoid the use of Prostin VR Sterile Solution in neonates with respiratory distress syndrome (hyaline membrane disease), which sometimes can be confused with cyanotic heart disease. If full diagnostic facilities are not immediately available, cyanosis (pO_2 less than 40 mmHg) and restricted pulmonary blood flow apparent on an X-ray are good indicators of congenital heart defects.

In all infants, commencing when infusion starts, intermittently monitor arterial pressure by umbilical artery catheter, auscultation, or with a Doppler transducer. Should arterial pressure fall significantly, decrease the rate of infusion immediately.

A weakening of the wall of the ductus arteriosus and pulmonary artery has been reported, particularly during prolonged administration.

Side-effects and Adverse reactions: The most frequent

adverse reactions observed with Prostin VR are related to its known pharmacological effects. These include flushing, bradycardia, hypotension, tachycardia, cardiac arrest, oedema, apnoea, diarrhoea, fever, convulsions disseminated intravascular coagulation, and hypokalaemia.

Overdosage: The effects of Prostin VR abate quickly when infusion is stopped.

Pharmaceutical precautions Prostin VR must be stored in a refrigerator. See dilution instructions for shelf-life of diluted solutions.

Legal category POM.

Package quantities Pack containing 5 × 1 ml ampoules Prostin VR Sterile Solution.

Further information Alprostadil (formerly known as prostaglandin E_2) dilates the ductus arteriosus in neonates, probably by relaxing smooth muscle in other parts of the vascular system, and can thus lower blood pressure.

Product licence number 0032/0083.

PROVERA*

Presentation White compressed tablets scored or one face, embossed 286 on either side of score, and marked U on other face, containing 5 mg medroxyprogesterone acetate.

Uses Progestogen.

Indicated for secondary amenorrhoea and for functional uterine bleeding.

Dosage and administration Oral.

Secondary Amenorrhoea: 2.5–10 mg daily for 5–10 days beginning on the assumed or calculated sixteenth to twenty-first day of the cycle. Repeat treatment for three consecutive cycles. In amenorrhoea associated with a poorly developed proliferative endometrium, conventional oestrogen therapy may be employed in conjunction with medroxyprogesterone acetate in doses of 5–10 mg for 10 days.

Functional uterine bleeding: 2.5–10 mg daily for 5–10 days commencing on the assumed or calculated sixteenth to twenty-first day of the cycle. Treatment should be given for two consecutive cycles. When bleeding occurs from a poorly developed proliferative endometrium, conventional oestrogen therapy may be employed in conjunction with medroxyprogesterone acetate, in doses of 5–10 mg for 10 days.

Contra-indications, warnings, etc

Contra-indications: None applicable.

Precautions: Whether administered alone or in conjunction with oestrogens, Provera should not be employed in patients with abnormal uterine bleeding until a definite diagnosis has been established and the possibility of genital malignancy eliminated.

Side-effects: No significant untoward effects or intolerance have been reported.

Overdosage: In animals Provera has been shown to be capable of exerting an adreno-corticoid effect but this has not been reported in the human, following usual dosages. The oral administration of Provera at a rate of 100 mg per day has been shown to have no effect on adrenal function.

Pharmaceutical precautions None.

Legal category POM.

Package quantities Bottles of 100.

Further information Provera is a highly active gestational agent. During its years of clinical use no significant toxicity has been recorded and it appears to be free of androgenic and oestrogenic effects.

Product licence number 0032/5035.

OVERA 100 mg*

Presentation White tablets marked 'U' on one side and '467' on the other, containing 100 mg medroxyprogesterone acetate.

Uses Progestogen.

Indicated for the treatment of certain hormone-dependent neoplasms, such as endometrial carcinoma and oestrogenoma.

Dosage and administration Oral.

100–400 mg daily continued for up to three months in order to assess response.

Intra-indications, warnings, etc

Contra-indications: Provera 100 mg is not recommended for primary or total therapy for carcinoma unless surgery or radiotherapy is not feasible.

Warnings: None applicable.

Precautions: In animals Provera has been shown to be capable of exerting an adreno-corticoid effect, but this has not been reported in the human, following usual dosages. The oral administration of Provera at a rate of 0 mg per day has been shown to have no effect on renal function.

Side-effects: Provera 100 mg appears to be devoid of androgenic effects. Masculinisation of the female foetus has not been demonstrated in animals but, despite extensive studies, the only changes reported in humans have been of minor significance (clitoral hypertrophy) and have reverted to normal in a few weeks.

Overdosage: No action required other than cessation of therapy (see 'Precautions').

Pharmaceutical precautions None.

Legal category POM.

Package quantities Bottles of 100.

Further information Provera 100 mg has achieved considerable success in the hormonal management of gynaecological malignancy. The overall picture is that of a selective remission has been obtained in about 25% of cases.

Product licence number 0032/5036.

SOLU-CORTEF*

Presentation White, freeze-dried powder of hydrocortisone sodium succinate, equivalent to 100 mg hydrocortisone, in rubber-capped vials.

Uses Anti-inflammatory agent.

Indicated for acute adrenocortical insufficiency, bilateral adrenalectomy, severe shock, acute hypersensitivity reactions, overwhelming infections with severe toxicity, systemic lupus erythematosus in relapse, aspiration

pneumonitis and other conditions requiring the metabolic and anti-inflammatory actions of hydrocortisone.

Dosage and administration Intravenous injection, intravenous infusion or intramuscular injection.

Preparation of solutions for intravenous or intramuscular use:

For intravenous and intramuscular injection add 2 ml sterile water for injection from accompanying ampoule to the vial, shake and withdraw for use.

For intravenous infusion, prepare a primary solution as above and then add to 100–1,000 ml (not less than 100 ml) of 5% dextrose in water, or isotonic saline or 5% dextrose in isotonic saline solution, if patient is not on sodium restriction.

When reconstituted as directed, the pH of solution will range from 7.0 to 8.0.

Dosage usually ranges from 100 mg to 500 mg, depending on the severity of the condition, and should be administered by intravenous injection over a period of one to several minutes.

In infants and children dose may be reduced but should not be less than 25 mg daily.

In critically ill patients, particularly in shock, it has been recommended that a dose of 1 g administered intravenously over several minutes be given, followed by 500 mg every four to eight hours for three to five days if necessary.

Contra-indications, warnings, etc

Contra-indications: The usual contra-indications to the use of systemic corticosteroids apply (excepting in the case of treatment of bilateral adrenalectomy) and include latent, healed and active tuberculosis, herpes simplex, chronic nephritis, acute psychosis, Cushing's syndrome, peptic ulcer and predisposition to thrombophlebitis.

Warnings: Due to its inhibitory effect on fibroplasia hydrocortisone may mask signs of infection, and enhance dissemination of the infecting organism.

Precautions: The existence of congestive heart failure, hypertension, diabetes, osteoporosis, or chronic psychotic reactions necessitate caution in the administration of Solu-Cortef.

Injection into the deltoid muscle should be avoided because of a high incidence of subcutaneous atrophy.

Side-effects: Since Solu-Cortef is normally employed on a short-term basis it is unlikely that side-effects will occur; however, the possibility of side-effects attributable to corticosteroid therapy should be recognised.

Overdosage: No known antidote. Following overdosage the possibility of adrenal suppression should be guarded against by gradual diminution of dose levels over a period of time. In such event the patient may require to be supported during any further traumatic episode.

Pharmaceutical precautions Store at room temperature. No diluents, other than referred to, are recommended.

Legal category POM.

Package quantities Solu-Cortef is supplied as: 100 mg vial with an ampoule containing 2 ml of water for injection.

Further information In the treatment of shock, massive, pharmacological, doses of corticosteroid of the order of equivalents of 1 g hydrocortisone are accepted therapy. It is considered that the corticosteroid assists in resensitising the capillary bed, thus helping to prevent blood stagnation and the onset of irreversible shock.

Product licence number
100 mg vial 0032/5019.

SOLU-MEDRONE*

Presentation Mix-O-Vials of 40 mg and 125 mg methylprednisolone (as the sodium succinate). Each Mix-O-Vial consists of adjoining compartments of lyophilised powder and solvent. Also 500 mg, 1 g and 2 g vials of methylprednisolone (as the sodium succinate) with solvent.

Uses Medrone is a potent corticosteroid with an anti-inflammatory activity at least five times that of hydrocortisone. An enhanced separation of glucocorticoid and mineralocorticoid effect results in a reduced incidence of sodium and water retention.

Solu-Medrone is indicated for any condition in which rapid and intense corticosteroid effect is required such as:

1. Hypersensitivity reactions.
2. Severe shock, i.e. haemorrhagic, septic, surgical, traumatic, or cardiogenic.
3. Overwhelming infection with severe toxæmia.
4. Acute adrenal insufficiency.
5. Suppression of graft rejection reactions following transplantation.
6. Cerebral oedema.
7. The treatment of certain emergency situations in advanced cancer patients such as acute dyspnoea due to pulmonary or mediastinal metastases or the obstruction of other hollow viscera.

Dosage and administration Solu-Medrone may be administered intravenously or intramuscularly, the preferred method for emergency use being intravenous injection given over a suitable time interval (see 'Precautions'). For intravenous infusion the initially prepared solution may be diluted with 5% dextrose, isotonic saline or dextrose saline. Dosage should be varied according to the severity of the condition. In general not less than 0.5 mg/kg/day. In the treatment of shock and graft rejection reactions a dose of up to 30 mg/kg may be required for limited periods. For detailed recommendations on dosage see Package Insert.

Contra-indications, warnings, etc

Contra-indications: Like all corticosteroids Solu-Medrone is contra-indicated in herpes simplex keratitis, acute psychoses, and latent, healed or active tuberculosis. Relative contra-indications include active or latent peptic ulcer, Cushing's syndrome, diverticulitis, osteoporosis, renal insufficiency, thromboembolic tendencies, diabetes mellitus, hypertension, local or systemic infection including viral, fungal and other exanthematous diseases. Pregnancy is included as a relative contra-indication.

Warnings and precautions: There have been a few reports of cardiovascular collapse associated with the rapid intravenous administration of large doses of Solu-Medrone (greater than 500 mg) in organ transplant recipients. The cause and relation to other medications (e.g. diuretics) are not known at this time, but physicians and surgeons should be alert to this possibility. When administering Solu-Medrone in high doses intravenously, it should be given over a period of 10–20 minutes. It should be remembered that prolonged high-dose corticosteroid therapy can cause serious corticosteroid-induced side-effects, and high dose therapy

should, in general, be continued only until the patient condition has stabilised: usually not beyond 48–hours.

Solu-Medrone should not be used for the treatment of cardiogenic shock if the central venous pressure is under 10 cm water.

In the treatment of acute adrenal insufficiency sodium-retaining corticosteroid, in addition to Solu-Medrone, will be needed.

When used to treat cerebral oedema due to brain trauma, gastro-intestinal bleeding may occur and the stool guaiac tests may be diagnostically helpful. Prompt lactic peptic ulcer therapy (i.e. antacids, etc) should be considered.

Injection into the deltoid muscle should be avoided because of a high incidence of subcutaneous atrophy.

The normal precautions to the use of system corticosteroids should be observed.

Adverse reactions and side-effects: Under normal circumstances Solu-Medrone therapy would be considered as short-term. However, the possibility of side-effects and adverse reactions common to corticosteroids must be considered, particularly when high-dose therapy is being used.

Overdosage: No known antidote. Following overdosage the possibility of adrenal suppression should be guarded against by gradual diminution of dose levels over period of time. In such event the patient may require be supported during any further traumatic episode.

Pharmaceutical precautions Mix-O-Vials should be protected from freezing. Prepared solutions should be used within 48 hours. No special requirement for syringe or infusion solution containers.

Legal category POM.

Package quantities Mix-O-Vials of 40 mg/1 ml, and 125 mg/2 ml.

Vials of 500 mg, 1 g and 2 g plus solvent.

Further information The following instructions for the use of the Mix-O-Vials should be observed. Remove the protective cap from the Mix-O-Vial. Give a half-turn to the piston and press it down as far as possible to allow the diluent to pass into the lower powder chamber. Shake well until solution is complete. Sterilise the surface of the rubber piston. Hold the vial up at 45° and insert the syringe needle through the centre of the piston and withdraw the required quantity of solution.

TOLANASE*

Presentation White, scored, convex tablets marked 'UPJOHN 70' on the opposite side, containing 100 mg tolazamide.

White, scored, convex tablet marked 'UPJOHN 11' on other side, containing 250 mg tolazamide.

Uses Sulphonylurea.

Indicated in maturity-onset diabetes of mild to moderate severity.

Dosage and administration Oral.

100–250 mg daily, or up to 1 g daily in divided doses necessary. It is doubtful whether doses greater than 1 g daily will result in improved control. (For dose inversion from other oral hypoglycaemic agents see literature.)

Depending on the results of urinary glucose tests and blood sugar determinations the daily dose should be either raised or lowered by amounts of one tablet (100 mg or 250 mg) at weekly intervals.

Contra-indications, warnings, etc

Contra-indications: Tolanase is not indicated in juvenile labile (brittle) diabetes, or in patients with infections those undergoing surgery or trauma. It is contra-indicated in patients with ketosis, acidosis or in coma, and who have a history of such.

Since Tolanase has not been studied extensively in diabetes complicated by pregnancy or in diabetics with liver, kidney or endocrine disease, it is not recommended in these instances.

Warnings: The appearance of significant acetonuria in a patient transferred from insulin to tolazamide makes a return to insulin therapy mandatory.

Side-effects: The most commonly encountered symptoms are gastro-intestinal (1.8%), including nausea, anorexia, diarrhoea. Other minor occurrences, such as dizziness, weakness, insomnia, lethargy, have been reported. A disulfiram-like action after taking alcohol has not been reported.

Overdosage: Action should be taken to counteract the ensuing hypoglycaemic period. No known antidote.

Pharmaceutical precautions Store at room temperature.

Legal category POM.

Package quantities Tolanase is supplied as tablets containing 100 mg or 250 mg tolazamide in bottles of 10 and 500.

Further information The half-life of seven hours makes Tolanase an ideal agent for a single or twice-daily dose regime.

Tablets 100 mg 0032/5043

Tablets 250 mg 0032/5044

TROBICIN*

Description Vial containing spectinomycin dihydrochloride pentahydrate equivalent to spectinomycin 3 g. Also ampoule of diluent containing benzyl alcohol 9%. When reconstituted with diluent each vial yields 1 ml containing the equivalent of 400 mg spectinomycin per millilitre.

Uses Antibiotic for intramuscular injection in the treatment of gonorrhoea.

Dosage and administration For adults a single dose as follows:

Males: 2 g by deep intramuscular injection.

Females: 4 g by deep intramuscular injection.

The dose may be divided between two injection sites.

Contra-indications, warnings, etc

Contra-indications: Trobicin is not indicated for the treatment of syphilis.

Warnings: Antibiotics used in high doses for short periods of time to treat gonorrhoea may mask or delay the symptoms of incubating syphilis. Since the treatment of acute syphilis demands prolonged therapy with any effective antibiotic, patients being treated for gonorrhoea should be closely observed clinically for a period of four to six weeks. Appropriate serological follow-up for at least four months should be instituted if a diagnosis of syphilis is suspected.

Safety for use in pregnancy has not been established.

Side-effects: During clinical trials no anaphylactic reactions or other serious side-effects were encountered. However, the usual precautions should be observed with atopic individuals. The following minor side-effects have been observed: dizziness, nausea, chills-fever, urticaria and (rarely) mild to moderate discomfort at the injection site.

Overdosage: Overdosage is unlikely to be a problem in practice.

Pharmaceutical precautions Shake vial vigorously immediately after adding diluent and before withdrawing dose. Dilution of the reconstituted suspension should not be necessary. Prepared suspension should be stored at room temperature and used within 24 hours. Otherwise no special storage precautions.

Legal category POM.

Package quantities 1 × 2 g vial plus diluent.

Further information Trobicin bears no structural or antigenic relationship to the penicillins. It is an inhibitor of protein synthesis in the bacterial cell, the site of action being the 30 S ribosomal subunit. Trobicin is rapidly absorbed after intramuscular injection, a single 2 g dose producing peak serum concentrations averaging 103 mcg/ml at one hour. Serum concentrations inhibitory to most gonococcal strains persist for up to eight hours. Up to 100% of the administered dose is excreted in the urine within 48 hours in a biologically active form.

WANDER

CAFERGOT* SUPPOSITORIES

Presentation Off-white suppositories weighing 1.98 g. Each suppository contains 2 mg Ergotamine Tartrate PhEur and 100 mg Caffeine PhEur.

Uses Cafergot contains a combination of ergotamine and caffeine specially developed for the treatment of the acute migraine attack. Ergotamine aborts attacks of migraine and related vascular headaches by a direct vasoconstrictor effect on distended extra-cranial arteries. Concomitant administration of caffeine enhances the absorption of ergotamine.

Cafergot Suppositories are specially valuable for patients who have nausea and vomiting early in the attack and cannot retain or absorb anything taken by mouth. To be fully effective the suppositories must be used as early as possible in the attack.

Indications: Migraine. Migraine variants.

Dosage and administration One suppository should be administered at the first warning of an attack. This dose is normally sufficient, but if relief is not obtained additional doses may be taken up to a maximum of 3 suppositories. Subsequently, the total dose found effective in a previous attack should be administered immediately prodromal symptoms are experienced. Maximum dosage is 3 suppositories per day and 5 in any one week.

Contra-indications, warnings, etc

Contra-indications: Pregnancy, peripheral vascular disorders, coronary disease, impaired hepatic or renal function, sepsis, obliterative vascular disease, severe hypertension, breast feeding.

Precautions: Concomitant use of erythromycin and ergotamine should be avoided.

Overdosage: Treatment should be directed to the elimination of ingested material by aspiration and gastric lavage. Arterial spasm may be corrected by the administration of a vasodilator. General supportive measures should be applied with particular reference to the respiratory and cardiovascular systems.

Side-effects: Drowsiness, nausea, vomiting and occasionally weakness in the legs and muscle pain may occur; numbness and tingling of the extremities can be indicative of peripheral vascular disturbance and treatment must be stopped immediately if signs of circulatory impairment appear. Failure to observe this precaution can lead to the development of ergotism.

Pharmaceutical precautions Keep in a cool place.

Legal category POM.

Package quantities Boxes of 6 and 30.

Further information Cafergot suppositories no longer contain total alkaloids of belladonna or isobutylallylbar-

bituric acid. Cafergot suppositories without these constituents are supplied in packs marked 'Revised Formulation'.

Product licence number 0101/5001.

CAFERGOT* TABLETS

Presentation Very pale pink, round, coated tablet: 9.5–10 mm diameter, 5.4 to 5.6 mm thick, weighing 370 mg. Branded 'WANDER' on one face. Each tablet contains 1 mg Ergotamine Tartrate PhEur, 100 mg Caffeine PhEur.

Uses Properties: Cafergot contains a combination of ergotamine and caffeine specially developed for the treatment of the acute migraine attack. Ergotamine aborts attacks of migraine and related vascular headaches by a direct vasoconstrictor effect on distended extracranial arteries. Concomitant administration of caffeine enhances the absorption of ergotamine. To be fully effective the tablets must be taken as early as possible in the attack.

Indications: Migraine. Migraine variants.

Dosage and administration Two tablets should be taken at the first warning of an attack. This dose is normally sufficient, but if relief is not obtained within an hour a further tablet should be taken, repeated if necessary at half-hourly intervals up to a maximum of 6 tablets. Subsequently, the total dose found effective in a previous attack should be taken immediately prodromal symptoms are experienced. Maximum dosage is 6 tablets per day and 10 in any one week.

Contra-indications, warnings, etc

Contra-indications: Pregnancy, peripheral vascular disorders, coronary disease, impaired hepatic or renal function, sepsis, obliterative vascular disease, severe hypertension and breast feeding.

Precautions: Concomitant use of erythromycin and ergotamine should be avoided.

Overdosage: Treatment should be directed to the elimination of ingested material by aspiration and gastric lavage. Arterial spasm may be corrected by the administration of a vasodilator. General supportive measures should be applied with particular reference to the respiratory and cardiovascular systems.

Side-effects: Nausea, vomiting and occasionally weakness in the legs and muscle pain may occur, numbness and tingling of the extremities can be indicative of peripheral vascular disturbance and treatment must be stopped immediately if signs of circulatory impairment appear. Failure to observe this precaution may lead to the development of ergotism.

ESERIL*

resentation Canary-yellow, coated, round, bi-concave tablets weighing 100 mg, 6 mm diameter, 3.4–3.9 mm thick, branded 'WANDER' one side. Each tablet contains 1.33 mg methysergide hydrogen maleate (equivalent to 1 mg methysergide base).

ses Deseril is a potent serotonin antagonist.

World-wide clinical trials indicate that Deseril will prevent, or reduce the frequency or severity of, headaches in 60–70% of patients.

indications:

1. Prophylactic treatment of migraine in patients, who, despite other attempts at control, experience attacks of such severity or regularity that their social or economic life is seriously disrupted. (*Note.* Deseril is not recommended for the treatment of the acute attack.)
2. Periodic migrainous neuralgia (Horton's syndrome).
3. To control the profuse diarrhoea associated with carcinoid disease.

dosage and administration *Prophylactic treatment of headache.* 1–2 tablets two or three times a day, with meals. The initial dose of 1 tablet should preferably be given at bedtime and dosage should be increased gradually to effective levels over an approximately two-week period, so that minimal effective doses are employed. It is wiser to settle for the smallest amount which will prevent 75% of the attacks than to increase the dose to a high level in an effort to prevent all headaches. From the outset, patients should understand that regular clinical supervision and periodic interruption in treatment are imperative so that side-effects can be recognised and minimised.

'carcinoid syndrome.' High oral doses are usually necessary. In most cases on record dosage ranged between 2 and 20 tablets daily.

Deseril is not recommended for the treatment of children.

Contra-indications, warnings, etc

Contra-indications: Pregnancy, peripheral vascular disease, phlebitis or cellulitis of the lower limbs, clinical arteriosclerosis, coronary artery disease, impaired hepatic, renal or renal tract function, valvular heart disease, severe hypertension, pulmonary or collagen disorders, states of cachexia or sepsis.

Warnings: *Note.* Continuous Deseril administration should not exceed six months without a drug-free interval of at least one month for reassessment. It is usually wise to decrease the dosage of the drug gradually or two or three weeks before complete withdrawal to prevent rebound headaches.

In patients undergoing treatment with Deseril, the dose of ergotamine required to control any acute attack may have to be reduced.

Precautions: Regular clinical supervision of patients under treatment with Deseril is essential. Particular

attention should be paid to complaints of urinary dysfunction, pain in the loin, flank or chest, and pain, coldness or numbness in the limbs. Patients should be regularly examined for the presence of cardiac murmurs, vascular bruits, pleural or pericardial friction rubs and abdominal or flank masses or tenderness. Treatment with Deseril should be stopped should any of these symptoms or signs occur. Caution is also advised during drug administration to patients with a past history of peptic ulceration. In carcinoid syndrome the risk of untoward side-effects due to the higher dosage must be weighed against the therapeutic requirements.

Overdosage: Treatment should be directed to elimination of the ingested material by aspiration and gastric lavage. General supportive measures should be applied. The patient should be carefully observed for peripheral vasospasm which may be treated by warmth, care being taken to protect ischaemic limbs. If there is evidence of impending tissue damage vasodilators may be used.

Side-effects:

1. **General:** The most commonly reported side-effects have been nausea, heartburn, abdominal discomfort, vomiting, dizziness, lassitude and drowsiness, particularly in the initial stages of treatment. These side-effects can often be minimised by taking the preparation with food. Tissue oedema, insomnia, leg cramps and weight gain have occurred, and very occasionally skin eruptions or loss of scalp hair. Psychic reactions have appeared in isolated instances. These effects regressed on reduction in dosage or withdrawal of medication.

2. Inflammatory fibroses:

(a) **Retroperitoneal fibrosis.** In a small percentage of patients, continuous long-term Deseril administration has been associated with abnormal development of fibrous tissue in the form of retroperitoneal fibrosis. This rare condition usually presents with symptoms of ureteric dysfunction. If, therefore, persistent loin or flank pain, oliguria or dysuria occur, pyelographic evidence of hydronephrosis and ureteric deviation or obstruction should be sought. In such patients, subjected to laparotomy, retroperitoneal fibrosis has been found. However, drug withdrawal alone is associated with clinical improvement over a few days to several weeks, and appreciation of this may avoid unnecessary surgical intervention.

(b) **Fibrosis in other areas.** There are isolated reports of similar fibrotic processes involving lungs, pleura, heart valves and major vessels. Examination of all patients prior to the institution of treatment is advisable and the development of signs or symptoms attributable to these effects should lead to immediate cessation of treatment. There is evidence which suggests that these fibrotic manifestations are reversible although less readily so than retroperitoneal fibrosis. On occasion pulmonary fibrosis has been localised to give, on radiography, a tumour-like appearance with or without obliteration of costophrenic angles and the development of pleural effusion. Appreciation of these effects should prevent unnecessary radical surgery.

3. **Vascular:** Vascular reactions, including arterial spasm, have been seen in some patients. Such occurrences are very rare. The following have all been described, although in some instances the role of Deseril is arguable: arterial spasm in a limb, causing coldness, numbness, pain or intermittent claudication; renal artery spasm giving rise

to transitory hypertension; mesenteric artery spasm causing abdominal pain; retinal artery spasm causing reversible loss of vision; coronary artery spasm causing angina and questionably resulting in myocardial infarction. Arterial spasm is rapidly reversible following drug withdrawal, and the development of significant sequelae is unlikely.

Pharmaceutical precautions Nil.

Legal category POM.

Package quantities Containers of 100.

Further information Nil.

Product licence number 0101/5026.

GATINAR*

Presentation Gatinar is available as a clear, almost colourless to pale yellow syrup. Each 5 ml spoonful contains 3.35 g lactulose and 1.34 g of other sugars (lactose, galactose, tagatose and other keto-sugars).

Uses *Principal action:* Gatinar prevents the formation of hard stools and encourages normal bowel movement. Unlike traditional laxative preparations which act either on the innervation or musculature of the intestine or by bulk stimulus, Gatinar provides a natural substrate for the saccharolytic bacterial flora in the colon.

The active principle of Gatinar, lactulose, is a disaccharide which is not hydrolysed in the small intestine. Therefore it cannot be absorbed and is transported to the colon with water to retain the osmotic balance. In the colon, several species of bacteria can hydrolyse lactulose, to the monosaccharides galactose and fructose.

By encouraging this normal metabolic activity of the bacteria, the osmotic pressure of the colonic contents is doubled and more water is drawn into the bowel.

Further metabolism of the monosaccharides leads to the production of acetic and lactic acids and a lowering of colonic pH. This acidification of the colonic contents is considered to be the main reason for the effectiveness of Gatinar. In chronic portal-systemic encephalopathy it may be associated with the decrease in the relative concentration of free ammonia, the major agent involved in the cerebral disturbance.

Indications: Chronic constipation. Chronic portal-systemic encephalopathy.

Dosage and administration *Chronic constipation:* Because Gatinar acts naturally to encourage the normal activity of the bowel, it may be two or three days before the full benefit of the treatment is obtained. It is important, therefore, to follow the dosage regimen set out below.

Adults: Initially: Three to six 5 ml spoonfuls for the first two to three days of treatment. (Nine spoonfuls may be given in obstinate cases.)

Maintenance: Two to three 5 ml spoonfuls daily or according to the needs of the patient.

Children: Initially: two to five 5 ml spoonfuls for the first two or three days of treatment.

Maintenance: one to three 5 ml spoonfuls daily or according to the needs of the patient.

Chronic portal-systemic encephalopathy: Initial: Six to ten 5 ml spoonfuls three times daily according to the requirements of the patient for adequate acidification of the colonic contents.

Contra-indications, warnings, etc

Contra-indications: In common with other preparations used for the treatment of constipation, Gatinar should not be used in patients with gastro-intestinal obstruction.

Gatinar should not be given to patients with galactosaemia or intolerance to lactose.

Precautions: Gatinar should be used with caution during the first trimester of pregnancy.

Overdosage: No cases of intoxication due to deliberate or accidental overdosage with Gatinar have been reported to the Company.

Side-effects: Side-effects rarely occur after the administration of Gatinar. Mild, transient effects such as abdominal distention or cramps and flatulence, which subside after the initial stages of treatment, have occasionally been reported.

High doses may provoke nausea in some patients. This can be minimised by administration with water, fruit juice or with meals.

Pharmaceutical precautions Gatinar should be stored in a cool place.

Dilution of Gatinar is not recommended.

Legal category P.

Package quantities Bottles of 200 ml and 2 litres.

Further information Gatinar has an absolute calorific value of 18.7 kJ per 5 ml spoonful.

Product licence number 0101/0076.

SANOMIGRAN*

Presentation *0.5 mg Tablets:* Ivory/yellow, coated, bi-convex tablets of 5.5–5.6 mm diameter, weighing 90 mg. Printed WANDER on one face. Each tablet contains 725 mcg pizotifen hydrogen malate (equivalent to 500 mcg pizotifen base).

1.5 mg Tablets: Ivory/yellow, coated, bi-convex tablets of 9.0 mm diameter, weighing 280 mg. Printed SMG on one face. Each tablet contains 2.175 mg pizotifen hydrogen malate (equivalent to 1.5 mg pizotifen base).

Uses *Principal action:* Pharmacodynamic studies demonstrate that Sanomigran has a broad antagonistic activity against biogenic amines. Tests show powerful antiserotonergic and antitryptaminergic properties, marked antihistaminic effects and some antagonistic activity against kinins. Sanomigran also has a weak anticholinergic effect and useful sedative and antidepressant properties.

The well-documented prophylactic effect of Sanomigran against the migraine attack is associated with its ability to modify the humoral elements of the headache mechanism. The powerful antiserotonergic and antihistaminic properties inhibit the permeability-increasing effect of these amines on the affected cranial vessels, thereby checking transudation of plasmakinin and, as a result, maintaining the pain threshold of the receptors at 'normal' levels.

One of the first links in the chain of events leading to the migraine attack is a loss of tone in the extracranial arteries. A factor in this mechanism is the depletion of plasma serotonin. Sanomigran inhibits the re-uptake of serotonin by the blood platelets, thus maintaining plasma serotonin and preventing the loss of tone in the vessels. By this indirect effect Sanomigran provides a counter-

measure to the passive distension of the extracranial arteries and circumvents the migraine attack.

Indications: Prophylactic treatment of recurrent vascular headaches, including classical migraine, common migraine and cluster headache (periodic migrainous uralgia).

Dosage and administration Usually 1.5 mg daily which may be taken in one dose at night (one 1.5 mg tablet) or three times a day (three 0.5 mg tablets). The dosage can be adjusted to individual patient's requirements and may vary from 0.5 mg to 6 mg daily. Up to 6 mg may be given as a single daily dose.

Contra-indications, warnings, etc *Precautions:* Patients should be cautioned about the possibility of drowsiness and informed of its significance in the driving of vehicles and the operation of machinery. Although its anticholinergic activity is relatively weak, Sanomigran could probably not be administered in the presence of closed angle glaucoma or to patients with a predisposition to urinary retention. No adverse effects during pregnancy have been reported but Sanomigran should not be administered in pregnancy with due caution.

Overdosage: Symptoms of overdosage may include fatigue, drowsiness, dryness of the mouth, confusion, nausea, vomiting, dyspnoea, cyanosis, tachycardia, coma and respiratory paralysis. Treatment should be directed to the elimination of the drug by gastric lavage, diuresis. Severe hypotension must be corrected but it is noted that adrenaline may produce paradoxical effects. General surveillance measures are indicated.

Side-effects: The most commonly occurring side-effects are drowsiness, a gain in weight or an increased appetite. Other side-effects such as dizziness and nausea have been reported infrequently.

Pharmaceutical precautions Nil.

Legal category POM.

Package quantities 0.5 mg: containers of 100 tablets; 5 mg: Calendar packs of 28 tablets.

Further information Nil.

5 mg tablets 0101/0129

AVEGIL*

Presentation Tavegil is available as tablets and elixir.

Tablets: White, uncoated, round tablets, 7 mm in diameter, with bevelled edges, branded 'WANDER' on one side with a single break line and coded 'OT' on the other. Each tablet contains 1.34 mg clemastine hydrogen fumarate equivalent to 1 mg clemastine base.

Elixir: A clear, colourless liquid with an odour of peaches. Each 5 ml spoonful contains 670 mcg (0.67 mg) of clemastine hydrogen fumarate equivalent to 500 mcg (0.5 mg) of clemastine base.

Uses *Principal action:* Tavegil is a potent, specific antihistamine which is innately long-acting.

Indications: Allergic rhinitis, including hay fever and perennial rhinitis, vasomotor rhinitis. Allergic dermatoses, including pruritus, atopic eczema and contact dermatitis. Urticaria. Angioneurotic oedema. Drug allergy.

Dosage and administration *Tablets: Adults:* 1 tablet night and morning. In individual cases the dose may be increased to 6 tablets daily if necessary.

Children up to 12 years: $\frac{1}{2}$ –1 tablet night and morning according to age.

Elixir: Children up to 12 years: One or two 5 ml spoonfuls night and morning according to age.

Adults: Two 5 ml spoonfuls night and morning. In individual cases the dose may be increased to 12 spoonfuls daily if necessary. Tavegil Elixir is sugar-free and may be administered to diabetic patients.

Contra-indications, warnings, etc *Precautions:* Patients should be warned not to take charge of vehicles or machinery until the effect of Tavegil treatment on the individual is known. Tavegil may potentiate the effects of sedatives and alcohol. Tavegil should be given in pregnancy and breast feeding only if strictly indicated.

Overdosage: May give rise to confusion, nausea and vomiting. Treatment should be directed to the removal of ingested material by induced emesis or gastric lavage as appropriate.

Routine supportive measures are indicated to combat respiratory depression and hypotension.

Side-effects: Of the side-effects associated with antihistamine drugs, excessive sedation is the most common and troublesome. With Tavegil at normal dosage drowsiness is infrequent and when it occurs it is usually mild and transient. Very occasional miscellaneous side-effects such as weakness, dizziness, fatigue, dry mouth, palpitations, gastro-intestinal disturbance, heartburn and skin rash have occurred. In general, these adverse effects can be controlled by a diminution of dosage.

Pharmaceutical precautions Protect tablets from light. Tavegil Elixir may be diluted with Purified Water or Syrup BP. The diluted elixir should be used within 14 days.

Legal category P.

Package quantities *Tavegil Tablets:* Containers of 50 and 500.

Tavegil Elixir: Bottles of 150 ml and 2 litres.

Further information Tavegil Elixir has an absolute calorific value of 11 kcal per 5 ml spoonful.

Product licence numbers

Tavegil Elixir 0101/0058

TERONAC*

Presentation White, uncoated, bi-convex tablets of 8 mm diameter, each weighing 220 mg. Branded WANDER on one side, with a single break line and coded JC on the other. Each tablet contains 2 mg of mazindol base.

Uses *Principal action:* Teronac is an appetite suppressant with potent anorexic activity. It has a novel chemical structure.

It is unrelated to amphetamine and is not metabolised to an amphetamine derivative.

Indications: An aid to the establishment of a diet in the treatment of the overweight.

Teronac may be used in patients with stable heart disease, and in diabetic patients: (see Precautions).

Dosage and administration *Adults and children over 12 years of age:* 1 tablet after breakfast or as directed by the physician.

A treatment period of three months is recommended as an aid to the establishment of a controlled diet. The recommended dosage should not be exceeded in an attempt to increase the effect.

Contra-indications, warnings, etc

Contra-indications: Teronac should not be used during pregnancy, breast feeding or in patients with peptic ulcer, glaucoma, severe renal, hepatic or cardiac insufficiency, cardiac arrhythmias and severe hypertension.

Teronac does not inhibit monoamine oxidase (MAO) but potentiates the pressor effects of catecholamines. It can therefore be anticipated that Teronac will interact with the following: MAO inhibitors and antihypertensives of the adrenergic neurone blocking type, e.g. guanethidine and debrisoquine.

These medicinal agents should not be taken until one month has elapsed from the cessation of treatment with Teronac.

Precautions: Teronac should be used with caution in patients with coronary heart disease, severely agitated states, and in patients taking thyroid medication or psychostimulants.

Patients should be cautioned against taking cough and cold remedies containing sympathomimetic decongestants during treatment with Teronac and for one month after ceasing treatment, without first seeking the doctor's advice. This caution is also applicable to patients undergoing local anaesthesia for dental procedures with products containing adrenaline or other sympathomimetic haemostatics.

The response to insulin and oral antidiabetic agents may be affected in diabetic patients treated with Teronac and therefore dietary control and thus the metabolic status of the patient should be kept under observation during treatment and the dosage of insulin or oral antidiabetic agents adjusted if necessary.

Patients driving vehicles or operating machinery should be alerted to the possibility of impaired reactions.

Overdosage: Treatment should be directed to the removal of ingested material by induced emesis and gastric lavage as appropriate. Hyperactivity and anxiety are major factors of overdosage, excess CNS stimulation should be controlled if necessary with chlorpromazine. There is no reported use of forced acid diuresis, but it may be of theoretical value.

Side-effects: The most commonly occurring side-effects include constipation, dry mouth and insomnia. Less frequently nervousness, headache, dizziness, chills, skin rashes, reversible disturbances of micturition and sexual function may also occur. Mild tachycardia has occasionally been reported at higher dosage levels.

Pharmaceutical precautions Store in a dry place at a temperature not exceeding 21°C.

Legal category POM.

Package quantities Containers of 30 and 100 tablets.

Further information Weight loss is steady and consistent during treatment with Teronac. In contrast to treatment with amphetamine-like obesity preparations, tolerance to treatment does not develop and there is no rebound effect on mood or appetite on cessation of therapy.

Product licence number 0101/0079.

TREMONIL®

Presentation White, uncoated, bi-convex tablets 8 mm diameter, each weighing 155 mg. Break line one side, with 'WANDER' imprinted on the other side. Each tablet contains 5 mg of methixene hydrochloride.

Uses *Principal actions:* Tremonil is a parasympatholytic agent and has spasmolytic and antihistaminic properties.

Indications: Tremonil is indicated in the treatment of Parkinsonism of any aetiology: paralysis agitans, postencephalitic Parkinsonism, arteriosclerotic Parkinsonism, drug-induced Parkinsonism. It is more effective in controlling the tremors than in reducing the rigidity of this syndrome.

Tremonil is also indicated in the treatment of senile tremor.

Dosage and administration *Adults:* At the beginning of treatment the total daily dosage should be small and given in divided doses over the day. Treatment may be started with single doses of 2.5 mg ($\frac{1}{2}$ tablet), three times daily. The dose may then be slowly and gradually raised by small increments until the most effective dose is reached.

The optimum effective dose lies between 15 mg and 60 mg daily in divided dosage, depending upon the severity of symptoms initially and their response to treatment.

In elderly patients, the optimum maintenance dosage is often lower, e.g. 15–30 mg daily, than that required in younger subjects with comparable disease.

Children: There are no dosage recommendations for children.

Contra-indications, warnings, etc

Contra-indications: Prostatic hypertrophy and other conditions causing urinary retention; narrow angle glaucoma, cardiac arrhythmias, intestinal hypomotility, myasthenia gravis, acute intoxication with alcohol, hypnotics, analgesics or psychotropics.

Precautions: Autonomic disturbances occasionally occur during the initial stages of treatment and due caution should be observed in patients who have to drive or perform tasks requiring precision. If these do not disappear spontaneously as treatment proceeds, the dose should be lowered until the highest well-tolerated dose is reached. Treatment should be continued at this level for several days and then gradually increased.

Special care is needed in the adjustment of the dosage in patients with marked autonomic liability.

When changing treatment from another anti-Parkinson drug, the small starting dose of Tremonil should be substituted for a part of the dosage of the drug already in use. As the dose of Tremonil is increased, that of the drug for which it is being substituted should be reduced accordingly.

When adding Tremonil to another anti-Parkinson drug it is advisable to reduce slightly the dose of the latter for a few days. In this way the occurrence of undesirable side-effects due to the sudden increase in the total dose of parasympatholytic agents may be avoided.

When Tremonil is administered concurrently with phenothiazine tranquilisers to control extrapyramidal side-effects, the average total daily dose of Tremonil should be around 15 mg.

Tremonil should be given in the early stages of pregnancy and during breast feeding only if strictly indicated.

de-effects: Tremonil is generally well tolerated but signs of autonomic imbalance, e.g. dryness of mucous membranes, transient visual disturbances, tachycardia, lightheadedness and dizziness, may occur in some patients during the early stages of treatment. These symptoms tend to disappear spontaneously during treatment, but a temporary reduction in dosage may be required. See commendations under 'Dosage'.

Nausea, sensations of abdominal pressure, weakness and fatigue may occur half to one hour after a single dose of 10–15 mg.

Constipation and urinary retention have been noted.

Mental confusion may result from the use of synthetic anti-Parkinson drugs, especially when given in high dosage, or to elderly patients, and the possibility of this de-effect should be borne in mind, especially when several drugs are given concurrently.

If signs of mental confusion are observed the drug should be discontinued immediately.

verdosage: Toxic effects are anticholinergic in nature.

Gastric lavage. Routine supportive measures. Give fluids freely. Atropine antagonists such as neostigmine ethylsulphate may relieve the peripheral symptoms. Although physostigmine (1 to 4 mg i.v.) will antagonise the central effects, it is rarely indicated.

pharmaceutical precautions Nil.

legal category POM.

package quantities Containers of 100 tablets.

further information Nil.

product licence number 0101/5904.

RIOCOS*

presentation Clear, colourless syrup with a citrus flavour. Each 5 ml spoonful contains 5 mg Pholcodine hEur, 20 mg Pseudoephedrine Hydrochloride BP, 2 mg chlorpheniramine Maleate BP, 600 mg Glycerol PhEur, and 5.25 g Syrup BP.

Uses *Principal action:* Triocos is a cough suppressant and decongestant. Of the active ingredients, pholcodine has a specific depressant effect on the cough centre in the medulla, has a more potent action than codeine, causes less respiratory depression than morphine and is not implicated in undesirable gastro-intestinal side-effects such as constipation, anorexia or vomiting; it has also the advantage of being well tolerated by children. Pseudoephedrine hydrochloride is an effective nasal and bronchial decongestant. Chlorpheniramine maleate is a well-tried antihistamine beneficial in the management of nasal irritation and in associated allergic symptoms.

Indications: The relief of cough, particularly when associated with congestion of nasal and bronchial mucous membranes.

Dosage and administration *Adults:* Two to three 5 ml spoonfuls every six hours as required.

Children: 6–12 years: One to two 5 ml spoonfuls every six hours as required.

1–6 years: Half to one 5 ml spoonful every six hours as required.

Do not exceed three doses in 24 hours.

Contra-indications, warnings, etc *Precautions:* As pseudoephedrine is a sympathomimetic amine, Triocos should be given with caution to hypertensive patients,

patients suffering from heart failure or to patients with incipient or established urinary retention, and should not be given to those being treated with monoamine oxidase (MAO) inhibitors or antihypertensives. Caution is necessary in patients receiving beta-blockers.

Antihistamines may cause drowsiness and dulling of mental alertness. Patients undergoing treatment with Triocos are advised not to take charge of vehicles, or other means of transport or machinery where loss of attention may lead to accidents.

Care should be exercised when administering antihistamines to patients with epilepsy as convulsions may be precipitated, especially in children.

Side-effects: The side-effects are those attributed to the antihistamines generally and the commonest include drowsiness, nausea, vomiting, headache, blurred vision, anorexia and dryness of the mouth.

Overdosage: Severe respiratory depression can be reversed by i.v. naloxone treatment.

Pharmaceutical precautions Triocos may be diluted with Syrup BP. The diluted syrup should be used within 14 days.

Legal category P.

Package quantities Bottles of 100 ml and 1 litre.

Further information Sucrose content 3.5 g per 5 ml dose. Absolute calorific value 12.3 kJ/5 ml.

Product licence number 0101/0104.

TRIOGESIC*

Presentation *Tablets:* Pink, bi-convex, round tablets of 645 mg weight, 12 mm diameter with a single break line on one side, and 'TRIOGESIC' engraved on the other. Each tablet contains 12.5 mg Phenylpropanolamine Hydrochloride BP and 500 mg Paracetamol PhEur.

Elixir: A deep red, clear liquid with a taste and odour of cherries. Each 5 ml spoonful contains 3 mg Phenylpropanolamine Hydrochloride BP, 125 mg Paracetamol PhEur and 0.5 ml ethanol (96%).

Uses *Principal action:* Triogesic provides a decongestant in conjunction with an analgesic.

Indications: For decongestion and relief from pain in coryza, sinusitis and otitis media.

Dosage and administration *Tablets: Adults:* 1 or 2 tablets every four hours.

Children 6 years and over: Half a tablet every four hours.

Do not exceed 8 tablets (adults) or 4 tablets (children) in 24 hours.

Elixir: Adults: Four 5 ml spoonfuls every four hours.

Children 6 years and over: Two 5 ml spoonfuls every four hours.

Children 1 to 5 years: One to two 5 ml spoonfuls every four hours.

Do not exceed 8 doses (adults) or 4 doses (children) in 24 hours.

Contra-indications, warnings, etc

Contra-indications: Hypertension, glaucoma, urinary retention.

Precautions: Triogesic should not be administered to patients during, or for two weeks after completion of treatment with monoamine oxidase (MAO) inhibitors. Caution is necessary in patients receiving beta-blockers.

Overdosage: Treatment should be directed to the elimination of the ingested material by aspiration and gastric lavage, and general supportive measures provided. Paracetamol levels should be checked. The antidotes methionine or N-acetyl cysteine should be given if indicated by ingested dose, plasma levels and time since ingestion, to prevent liver damage.

Pharmaceutical precautions Triogesic Elixir may be diluted with Syrup BP and Purified Water BP. The diluted elixir should be used within 14 days.

Legal category P.

Package quantities *Triogesic Tablets:* Containers of 12, 30 and 250.

Triogesic Elixir: Bottles of 150 ml and 1 litre.

Further information Triogesic Elixir does not contain sucrose. Each 5 ml spoonful has an absolute calorific value of 22.1 kJ.

Product licence numbers

Triogesic Tablets 0101/5907
Triogesic Elixir 0101/5908

TRIOMINIC*

Presentation *Tablets:* Yellow, round, bi-convex tablets of 470 mg weight, 11.1 mm diameter, 4.7 mm thick. Impressed 'WANDER' on one side. Each tablet contains 25 mg Mepyramine Maleate BP, 25 mg pheniramine maleate and 50 mg Phenylpropanolamine Hydrochloride BP.

Syrup: Clear, orange-red syrup with citrus flavour. Each 5 ml spoonful contains 6.25 mg Mepyramine Maleate BP, 6.25 mg pheniramine maleate and 12.5 mg Phenylpropanolamine Hydrochloride BP.

Uses A combination of two antihistamines with a decongestant.

Indications: For symptomatic relief of hay fever, or other forms of rhinitis.

Dosage and administration *Tablets: Adults:* 1 tablet every six to eight hours, not exceeding 3 tablets in 24 hours. The tablets must be swallowed whole.

Syrup: Adults: Two 5 ml spoonfuls every four hours.

Children 6 years and over: One 5 ml spoonful every three to four hours.

Children under 6 years: Dosage in proportion (may be diluted with an equal volume of syrup or water).

The number of doses (adults and children) should not exceed 4 in 24 hours.

Contra-indications, warnings, etc

Contra-indications: Hypertension, glaucoma, urinary retention.

Precautions: Triominic should not be administered to patients during, or for two weeks after, treatment with monoamine oxidase (MAO) inhibitors. Caution is necessary in patients receiving beta-blockers. The usual precautions with antihistamines should be observed.

Overdosage: Treatment should be directed to the elimination of the ingested material by aspiration and gastric lavage. Measures should be taken to minimise excitation. Respiration may require assistance. General supportive measures are of importance.

Pharmaceutical precautions Triominic Tablets should be stored and dispensed in airtight containers.

The Syrup may be diluted with Syrup BP or Purified Water BP. The diluted syrup should be used within 14 days.

Legal category P.

Package quantities *Triominic Tablets:* Containers of 12, 50 and 250.

Triominic Syrup: Bottles of 150 ml and 1 litre.

Further information Triominic Syrup Contains 3.6 g sucrose per 5 ml spoonful with an absolute calorific value of 17.6 kJ.

Product licence numbers

Triominic Tablets 0101/5909
Triominic Syrup 0101/5910

TRIOPAED*

Presentation Clear, colourless liquid with a citrus flavour. Each 5 ml spoonful contains 4 mg Pholcodine PhEur, 750 mg Glycerol PhEur and 5.25 g Syrup BP.

Uses *Principal action:* Triopaed is a cough suppressant. The active ingredient, pholcodine has a specific depressant effect on the cough centre in the medulla. The central antitussive action of pholcodine is at least three times as powerful as that of codeine. Pholcodine is many times less toxic than codeine and is employed in much smaller doses. It causes less respiratory depression than morphine and is not implicated in gastro-intestinal side effects such as constipation, anorexia, vomiting etc.

Indications: Unproductive cough.

Dosage and administration *Children over 6 years:* One to two 5 ml spoonfuls every six hours as required.

2-6 years: One 5 ml spoonful every six hours as required.

Contra-indications, warnings, etc

Contra-indications: There are no known contra-indications to Triopaed apart from use in patients where suppression of cough reflex is inadvisable.

Side-effects: Pholcodine may occasionally cause nausea and drowsiness.

Overdosage: Gastric lavage and general supportive measures. Severe respiratory depression may be reversed by i.v. naloxone.

Pharmaceutical precautions Triopaed may be diluted with Syrup BP. The diluted Syrup should be used within 14 days of dispensing.

Legal category P.

Package quantities Bottles of 100 ml and 1 litre.

Further information Sucrose content 3.5 g per 5 ml dose. Absolute calorific value 15 kJ/5 ml.

Product licence number 0101/0109.

TRIOTUSSIC*

Presentation Opaque, orange suspension with orange flavour. Each 5 ml spoonful contains 12.5 mg Phenylpropanolamine Hydrochloride BP, 6.25 mg Mepyramine Maleate BP, 6.25 mg pheniramine maleate, 20 mg Noscapine PhEur, 90 mg terpin hydrate and 160 mg Paracetamol PhEur.

Uses *Indications:* Triotussic has been formulated to provide symptomatic relief of cough, pain and nasal congestion associated with the common cold.

Dosage and administration *Adults:* One to two 5 ml spoonfuls every three to four hours.

Children 6 years and over: Half to one 5 ml spoonful four times daily.

Children under 6 years: Dosage in proportion (may be diluted with Syrup BP).

The number of doses (adults and children) should not exceed 4 in 24 hours.

Contra-indications, warnings, etc

Contra-indications: Severe cardiovascular disorders, tachycardia, hypertension, glaucoma, urinary retention, prostatic enlargement, severe diabetes mellitus, hyrotoxicosis.

Precautions: Triotussic should not be administered to patients during, or for two weeks after, treatment with monoamine oxidase inhibitors (MAOIs) and antihypertensives. Caution is necessary in patients receiving beta-blockers. The usual precautions with antihistamines should be observed. The effects of alcohol and sedation may be potentiated and the effects of anticoagulants enhanced.

Overdosage: Treatment should be directed to the elimination of the ingested material by aspiration and gastric lavage. Respiration may require assistance. General supportive measures are of importance.

Pharmaceutical precautions Triotussic Suspension may be diluted with Syrup BP. The diluted syrup should be used within 14 days.

Legal category P.

Package quantities *Triotussic Suspension:* Bottles of 300 ml.

Further information Each 5 ml spoonful has an absolute calorific value of 17.35 kJ.

Product licence number 0101/5911.

ZADITEN* ▼

Presentation *1 mg capsules:* White, opaque, oblong, gelatine capsules, size 4 weighing 182 mg. Each capsule contains 1.38 mg ketotifen hydrogen fumarate (equivalent to 1 mg ketotifen base). Coded CS.

1 mg tablets: Off-white, uncoated, round, flat, bevelled tablets weighing 190 mg and 7 mm diameter. Single breakline one side and marked ZADITEN 1 on the other. Each tablet contains 1.38 mg ketotifen hydrogen fumarate (equivalent to 1 mg ketotifen base).

Elixir: Clear, colourless, strawberry flavoured elixir. Each 5 ml spoonful contains 1.38 mg ketotifen hydrogen fumarate (equivalent to 1 mg ketotifen base).

Uses *Principal action:* Zaditen possesses marked anti-anaphylactic properties and is effective in preventing asthmatic attacks.

Laboratory experiments indicate that this anti-anaphylactic activity may be due in the main to the inhibition of release of myotonic mediators from tissue mast cells and basophils, in particular SRS (slow reacting substance) and histamine, to the inhibition of SRS-induced broncho-spasms in vivo and to calcium antagonistic properties. In addition, Zaditen exerts a sustained

inhibitory effect on histamine reactions which can clearly be dissociated from its anti-anaphylactic properties.

Experimental investigations in asthmatic subjects have shown that Zaditen is as effective orally as a selective mast cell stabiliser administered by inhalation: antihistamines are ineffective in these tests.

The effectiveness of Zaditen in the prevention of bronchial asthma has been studied in long term clinical trials. Asthma attacks were reduced in number, severity and duration and in some cases the patients were completely freed from attacks. Progressive reduction of corticosteroids and/or bronchodilators was also possible.

The prophylactic activity of Zaditen may take several weeks to become fully established.

Zaditen will not abort established attacks of asthma.

Indications: Prophylactic treatment of bronchial asthma.

Dosage and administration *Adults:* 1 mg twice daily with food. If necessary the dose may be increased to 2 mg twice daily.

Children from two years: 1 mg twice daily with food. Patients known to be easily sedated should begin treatment with 0.5–1 mg at night for the first few days.

Contra-indications, warnings, etc

Contra-indications: A reversible fall in the thrombocyte count in patients receiving Zaditen concomitantly with oral antidiabetic agents has been observed in a few cases. This combination of drugs should therefore be avoided until this phenomenon has been satisfactorily explained.

Although there is no evidence of any teratogenic effect, recommendations for Zaditen in pregnancy or when breast feeding cannot be given.

Precautions: Post-marketing surveillance has shown, in the interim results, exacerbation of asthma in approximately 2 per 1000 patients. Since some of these asthmatic attacks might have been related to stopping existing treatment, it is important to continue such treatment for a minimum of two weeks after starting Zaditen. This applies especially to systemic corticosteroids and ACTH because of the possible existence of adrenocortical insufficiency in steroid-dependent patients: in such cases recovery of a normal pituitary-adrenal response to stress may take up to one year.

If intercurrent infection occurs Zaditen treatment must be supplemented by specific antimicrobial therapy.

During the first days of treatment with Zaditen reactions may be impaired. Patients should be warned not to take charge of vehicles or machinery until the effect of Zaditen treatment on the individual is known. Patients should be advised to avoid alcoholic drinks.

Zaditen may potentiate the effects of sedatives, hypnotics, antihistamines and alcohol.

Overdosage: The reported features of overdosage include confusion, drowsiness, nystagmus, headache and disorientation. One patient became unconscious and one developed convulsions. Bradycardia and respiratory depression should be watched for. Elimination of the drug with gastric lavage or emesis is recommended. Otherwise general supportive treatment is all that is required.

Side-effects: Drowsiness and, in isolated cases, dry mouth and slight dizziness may occur at the beginning of treatment, but usually disappear spontaneously after a few days.

Pharmaceutical precautions Protect from heat and

1336

WANDER PHARMACEUTICALS

moisture. Zaditen Elixir may be diluted with Syrup BP containing parahydroxybenzoate preservatives. Diluted elixir should be used within 14 days of preparation.

Legal category POM.

Package quantities *1 mg capsules*: Containers of 60 capsules.

1 mg tablets: Containers of 60 tablets.

Elixir 1 mg/5 ml: Bottles of 150 ml.

Further information Zaditen is currently being evaluated in other atopic conditions. Zaditen Elixir contains

1.5 g sucrose per 5 ml dose. Absolute calorific 13.1 kJals per 5 ml dose.

ANUGESIC* - HC CREAM

Presentation Buff-coloured cream with the characteristic odour of Balsam Peru. Each 100 g of cream contains:

Pramoxine Hydrochloride USP	1.00 g
Hydrocortisone Acetate Ph Eur	0.50 g
Benzyl Benzoate BP	1.20 g
Bismuth Oxide	0.875 g
Balsam Peru BPC 1973	1.85 g
Zinc Oxide Ph Eur	12.35 g
Resorcinol BP	0.875 g

Uses Anugesic-HC Cream provides antiseptic, astringent, emollient and decongestant properties. In addition the anti-inflammatory action of hydrocortisone helps to reduce swelling and hyperaemia. Pramoxine is a rapidly acting local anaesthetic. The cream may be used to provide lubrication for suppositories.

Anugesic-HC Cream is indicated for the comprehensive symptomatic treatment of severe and acute discomfort or pain associated with internal and external haemorrhoids, proctitis, cryptitis, anal fissures, pruritus ani and perianal sinuses. It is also indicated post-operatively in ano-rectal surgical procedures.

Dosage and administration *Adults:* Apply cream to the affected area at night, in the morning and after each evacuation.

Thoroughly cleanse the affected area, dry and apply cream by gently smoothing onto the affected area. For internal conditions use rectal nozzle provided and clean it after each use.

Not to be taken orally.

Children: Not recommended.

Contra-indications, warnings, etc

Contra-indications: Tubercular, fungal and most viral lesions including herpes simplex, vaccinia and varicella. History of sensitivity to any of the constituents.

Warnings: As with all products containing topical steroids the possibility of systemic absorption should be borne in mind. Prolonged or excessive use may produce systemic corticosteroid effects. During the first trimester of pregnancy long-term therapy with topical corticosteroids should be avoided.

Precautions: Following symptomatic relief definitive diagnosis should be established.

Side-effects: Rarely, sensitivity reactions.

Patients may occasionally experience transient burning on application, especially if the anoderm is not intact.

Overdosage: If swallowed, main toxic ingredient is resorcinol, which may cause shock, collapse, rash, convulsion and coma, but only if more than about 100 g Anugesic-HC Cream is swallowed.

Fever, nausea, vomiting, stomach cramps and diarrhoea may develop 3-12 hours after ingestion.

Pramoxine is relatively non-toxic and less sensitising than other local anaesthetics.

Hydrocortisone normally does not produce toxic effects in an acute single overdose.

Treatment of a large acute overdosage should include gastric lavage, purgation with magnesium sulphate and complete bed rest. If necessary, give oxygen, and general supportive measures. Methaemoglobinemia should be treated by intravenous methylene blue.

Pharmaceutical precautions Store at a temperature not exceeding 25°C.

Legal category POM.

Package quantity Tubes containing 15 g.

Further information Anugesic-HC Cream is prepared in a water-miscible base which provides intimate contact with the area to be treated without having to cross an anhydrous barrier. A cream is also more convenient to use being aesthetically more acceptable than ointments.

Product licence number 0019/5005.

ANUGESIC* - HC SUPPOSITORIES

Presentation Buff-coloured suppositories. Each 2.8 g suppository contains:

Pramoxine Hydrochloride USP	27 mg
Hydrocortisone Acetate Ph Eur	5 mg
Benzyl Benzoate BP	33 mg
Bismuth Oxide	24 mg
Bismuth Subgallate BP	59 mg
Balsam Peru BPC 1973	49 mg
Zinc Oxide Ph Eur	296 mg

Uses Anugesic-HC Suppositories provide antiseptic astringent, emollient and decongestant properties. In addition the anti-inflammatory action of hydrocortisone helps to reduce swelling and hyperaemia. Pramoxine is a rapidly acting local anaesthetic.

Anugesic-HC Suppositories are indicated for the comprehensive symptomatic treatment of severe and acute discomfort or pain associated with internal haemorrhoids, proctitis, cryptitis, anal fissures, pruritus ani and perianal sinuses. Also indicated post-operatively in ano-rectal surgical procedures.

Dosage and administration *Adults:* Remove wrapper and insert one suppository into the anus at night, in the morning and after each evacuation.

Not to be taken orally.

Children: Not recommended.

Contra-indications, warnings, etc

Contra-indications: Tubercular, fungal and most viral lesions including herpes simplex, vaccinia and varicella. History of sensitivity to any of the constituents.

Warnings: As with all products containing topical steroids the possibility of systemic absorption should be

borne in mind. Prolonged or excessive use may produce systemic corticosteroid effects. During the first trimester of pregnancy long-term therapy with topical corticosteroids should be avoided.

Precautions: Following symptomatic relief definite diagnosis should be established.

Side-effects: Rarely, sensitivity reactions.

Patients may occasionally experience transient burning on application, especially if the anoderm is not intact.

Overdosage: If swallowed, fever, nausea, vomiting, stomach cramps and diarrhoea may develop 3–12 hours after ingestion.

Pramoxine is relatively non-toxic and less sensitising than other local anaesthetics.

Hydrocortisone normally does not produce toxic effects in an acute single overdose.

Treatment of a large acute overdosage should include gastric lavage, purgation with magnesium sulphate and complete bed rest. If necessary, give oxygen, and general supportive measures. Methaemoglobinaemia should be treated by intravenous methylene blue.

Pharmaceutical precautions Store in a dry place, at a temperature not exceeding 25°C.

Legal category POM.

Package quantity Box of 12 suppositories.

Further information Nil.

Product licence number 0019/5006.

ANUSOL* CREAM & OINTMENT

Presentation *Anusol Cream:* A buff-coloured cream having the characteristic odour of Balsam Peru. Each 100 g of cream contains:

Bismuth Oxide	2.14 g
Balsam Peru BPC 1973	1.80 g
Zinc Oxide Ph Eur	10.75 g.

Anusol Ointment: A light buff coloured ointment having the characteristic odour of Balsam Peru. Each 100 g of ointment contains:

Bismuth Subgallate BP	2.25 g
Bismuth Oxide	0.875 g
Balsam Peru BPC 1973	1.875 g
Zinc Oxide Ph Eur	10.75 g.

Uses Anusol Cream and Anusol Ointment provide antiseptic, astringent and emollient properties which help to relieve discomfort associated with minor ano-rectal conditions. Anusol Cream also provides lubricating properties for use with suppositories. Indicated for the symptomatic relief of uncomplicated internal and external haemorrhoids, pruritus ani, proctitis and fissures. Also indicated post-operatively in ano-rectal surgical procedures and after incision of thrombosed or sclerosed ano-rectal veins.

Dosage and administration *Adults:* Apply to the affected area at night, in the morning and after each evacuation until the condition is controlled. Thoroughly cleanse the affected area, dry and apply cream or ointment. Anusol Ointment should be applied on a gauze dressing. Anusol Cream is prepared in a vanishing cream base and may be gently smoothed onto the affected area without the need to apply a gauze dressing. For internal conditions use rectal nozzle provided, and clean it after each use. Not to be taken orally.

Children: No dose recommended.

Contra-indications, warnings, etc

Contra-indications: History of sensitivity to any of the constituents.

Warnings: None applicable.

Precautions: None applicable.

Side-effects: Rarely, sensitivity reactions. Patients may occasionally experience transient burning on application especially if the anoderm is not intact.

Overdosage: Treatment of a large acute overdose should include gastric lavage, purgation with magnesium sulphate and complete bed rest. If necessary, apply oxygen and give general supportive measures.

Pharmaceutical precautions Store at a temperature not exceeding 25°C.

Legal category GSL.

Package quantities Anusol Cream: Tubes containing 23 g., Anusol Ointment: Tubes containing 25 g.

Further information The formula of Anusol Cream is similar to that of Anusol Ointment. The advantage of the cream preparation is that the water-miscible base gives intimate contact with the area to be treated and the medicaments do not have to cross an anhydrous barrier. A cream is also more convenient to use, being aesthetically more acceptable than ointments.

Pharmaceutical precautions Store at a temperature not exceeding 25°C.

Legal category GSL.

Packaging quantities Box of 12 or 24 suppositories.

Further information Nil.

Product licence number 0019/5001.

ANUSOL[®]-HC OINTMENT

Presentation A buff-coloured ointment having a characteristic odour of Balsam Peru. Each 100 g of ointment contains:

Hydrocortisone Acetate Ph Eur	0.25 g
Benzyl Benzoate BP	1.25 g
Bismuth Subgallate BP	2.25 g
Bismuth Oxide	0.875 g
Balsam Peru BPC 1973	1.875 g
Zinc Oxide Ph Eur	10.75 g
Resorcinol BP	0.875 g

Uses Anusol-HC Ointment provides antiseptic, astringent, emollient and decongestant properties which help to relieve discomforts associated with minor ano-rectal conditions. In addition the anti-inflammatory action of hydrocortisone helps reduce swelling and hyperaemia.

Indicated for the symptomatic relief of external and internal haemorrhoids, proctitis, cryptitis, anal fissures, pruritus ani and perianal sinuses. Also indicated post-operatively in ano-rectal surgical procedures.

Dosage and administration *Adults:* Apply ointment to the affected area at night, in the morning and after each evacuation.

Thoroughly cleanse the affected area, dry and apply ointment on a gauze dressing. For internal conditions use rectal nozzle provided and clean it after each use.

Not to be taken orally.

Children: Not recommended.

Contra-indications, warnings, etc

Contra-indications: Tubercular, fungal and most viral lesions including herpes simplex, vaccinia and varicella. History of sensitivity to any of the constituents.

Warnings: As with all products containing topical steroids the possibility of systemic absorption should be borne in mind. Prolonged or excessive use may produce systemic corticosteroid effects. Product licence number 0019/5003.

CENTRAX*

Presentation Blue, slightly mottled, circular, biconvex tablets, having a single breakline on one face. Each tablet contains 10 mg prazepam.

Uses Centrax is indicated for the symptomatic relief of anxiety-tension states resulting from stressful circumstances, anxiety associated with anxiety neurosis and other psychoneuroses, and as an adjunct in other disease states in which anxiety is manifested.

Dosage and administration Oral

Adults: The usual dosage is 30 mg daily in divided doses. The dose should be adjusted within the range 10 mg to 60 mg daily in accordance with response of the patient.

Elderly: Half the normal adult dose may be sufficient for a therapeutic response in the elderly.

Children: None.

Contra-indications, warnings, etc

Contra-indications: Known sensitivity to benzodiazepines, acute pulmonary insufficiency.

Use in pregnancy: There is no evidence as to drug safety in human pregnancy, nor is there evidence from animal work that it is free from hazard. Do not use during pregnancy, especially during the first and last trimesters, unless there are compelling reasons.

Precautions: Chronic pulmonary insufficiency, and in renal or hepatic disease.

In labour: High single doses or repeated low doses have been reported to produce hypotonia, poor sucking and hypothermia in the neonate, and irregularities in the fetal heart. In view of their molecular size, prazepam and its metabolites are probably excreted in human milk, therefore Centrax should not be given to nursing mothers.

Caution must be exercised in patients with glaucoma or myasthenia gravis because of possible deleterious effects attributed to the benzodiazepines in such patients.

Warnings and adverse effects: As with other benzodiazepines drowsiness, sedation, blurring of vision, unsteadiness and ataxia have been reported. The effects occur following single as well as repeated dosage and may persist well into the following day. Performance at skilled tasks and alertness may be impaired. Patients should be warned of this hazard and advised not to drive or operate machinery during treatment. The effects are potentiated by alcohol, phenothiazines, narcotics, barbiturates, other CNS depressant drugs, MAO inhibitors, and other anti-depressants. The elderly are particularly liable to experience these symptoms together with confusion especially if organic brain symptoms are present. Therefore in elderly or debilitated patients, the initial dose should be small, and increments should be made gradually, in accordance with the response of the

patient, to preclude ataxia or excessive sedation. See also Dependence Potential and Withdrawal Symptom below. Abnormal psychological reactions to benzodiazepines have been reported. Rare behavioural adverse effects include paradoxical aggressive outbursts, excitement, confusion, and the uncovering of depression with suicidal tendencies. Other rare adverse effects include slight decreases in blood pressure, gastro-intestinal and visual disturbances, skin rashes, urinary retention, head ache, vertigo, change in libido, blood dyscrasias and jaundice.

Dependence potential and withdrawal symptoms: In general, the dependence potential of benzodiazepines is low but this increases when high doses are attained especially when given over long periods. This is particularly so in patients with a history of alcoholism or drug abuse, or in patients with marked personality disorders. Regular monitoring of treatment in such patients is essential and routine repeat prescriptions should be avoided. Treatment in all patients should be withdrawn gradually as symptoms such as depression, nervousness, rebound insomnia, irritability, sweating, and diarrhoea have been reported following abrupt cessation of treatment in patients receiving even normal therapeutic doses for short periods of time. Abrupt withdrawal following excessive dosage may produce confusion, toxic psychosis, convulsions, or a condition resembling delirium tremens.

Treatment of overdosage: Clinical features of benzodiazepine overdosage include impaired level of consciousness, dizziness, ataxia, slurred speech and respiratory depression. Gastric lavage or emesis is rarely necessary and the mainstay of management is general supportive therapy.

Pharmaceutical precautions No special precautions.

Legal category POM.

Package quantities Packs of 100 tablets.

Further information This is a long acting benzodiazepine. Repeated dosage will lead to accumulation of drug metabolites. The elderly and patients with impaired renal and/or hepatic function will be particularly susceptible to adverse effects listed above. Treatment should be kept to a minimum and given only under close medical supervision. Little is known regarding efficacy or safety of benzodiazepines in long term use. It is advisable to review treatment regularly, and to discontinue use as soon as possible.

Product licence number 0019/0054

CHOLEDYL*

Presentation Coated pink, bi-convex tablets with a debossed 'Choleydl 100' on one side, containing 100 mg Choline Theophyllinate BP.

Coated yellow, bi-convex tablets with a debossed 'Choleydl 200' on one side, containing 200 mg Choline Theophyllinate BP.

An amber-coloured, chocolate-flavoured, clear syrup. Each 5 ml spoonful contains Choline Theophyllinate BP 62.5 mg.

Uses For the relief and prophylaxis of bronchospasm in chronic bronchitis and asthma.

Dosage and administration *Tablets:* Oral administration.

Adults: 400–1,600 mg daily in divided doses. The usual adult dose is 100–400 mg four times daily.

Children (over 6 years): 3–4 × 100 mg tablets daily in divided doses. The 200 mg tablet should not be administered to children.

Syrup: Oral administration.

Children (3–6 years): One or two 5 ml spoonfuls three times daily.

Contra-indications, warnings, etc

Contra-indications: Use in patients with a known hypersensitivity to the xanthine group of drugs. An initial dose of 5 mg/kg may be increased slowly over three-day periods until an optimum clinical response is achieved. The peak serum theophylline level should not reach values greater than 20 mcg/ml. Use in children at more than six-hourly intervals.

Precautions and warnings: Caution should be exercised in its use in patients with cardiac disease. Care should be taken in its use in patients suffering from insomnia and in its concomitant use with β -adrenergic agonists, glucagon and the other xanthine drugs as these will potentiate the effect of theophylline. The incidence of toxic effects may be enhanced by the concomitant use of ephedrine. There is no evidence of safety of this drug in human pregnancy but it has been in wide use for many years without apparent ill consequences; animal studies have shown no hazard. Choleleryl syrup contains invert sugar syrup (3.7 ml/5 ml) and due care should be taken where it is prescribed for patients with diabetes mellitus.

Side-effects: Occasional gastro-intestinal upsets may occur.

Overdosage: Characterised by nausea, vomiting, gastro-intestinal irritation, unusual thirst, tachycardia, fall in BP and collapse.

Treatment: If more than about 1 g ingested: Gastric lavage. For fall in blood pressure, nurse in head-down position and give pressor drugs i.v. with general supportive measures.

Pharmaceutical precautions Choleleryl Syrup should be stored in a dry place at a temperature not exceeding 25°C, and protected from light.

Legal category P.

Package quantities *Tablets 100 mg:* Bottles containing 100 and 500 tablets.

Tablets 200 mg: Bottles containing 100 and 500 tablets.

Choleleryl Syrup: Bottles containing 200 ml and 1 litre.

Further information Nil.

Syrup 0019/0048

ESTROVIS*

Presentation Pink-coloured, bi-convex tablets having one side debossed with 'W' monogram, the other side debossed 'Estrovis 4'. Each tablet contains Quinestrol 4.0 mg.

Uses Quinestrol is a synthetic oestrogen which is stored to a considerable extent in body fat.

Estrovis is indicated both for the inhibition of lactation and the suppression of established lactation.

Dosage and administration *Adults:* Oral administration.

Inhibition: 1 tablet given within six hours of delivery. Symptoms of lactation may occasionally develop on the fourth to sixth day and should be treated expectantly. Only if these symptoms persist and prove troublesome should a second tablet of Estrovis be necessary.

Suppression: 1 tablet to be given immediately the decision to suppress lactation has been made, followed by a second tablet 48 hours later. In many cases one tablet only will suffice to suppress an already failing lactation.

When 2 tablets are given it is advisable to inform the patient that she may experience a heavier than normal period when her menses resume.

Contra-indications, warnings, etc

Contra-indications: Use in patients with a history of, or existent thromboembolic disorders, or with breast or genital cancer (known or suspected to be oestrogen dependent). Use in patients with existing thrombophlebitis or cerebrovascular disease or cardiovascular disease. Use in patients with undiagnosed, irregular vaginal bleeding. Use in pregnancy or suspected pregnancy and in patients with impaired liver function or with active liver disease.

Warnings and precautions: Use in patients suffering from epilepsy, or a history of migraine, asthma or cardiac dysfunction, may result in exacerbation of these disorders because of fluid retention. A decreased glucose tolerance may occur in diabetic patients on this treatment and their control must be carefully supervised. It is important that oestrogens or oestrogen/progestogen combinations should be used at the lowest possible dosage and for the shortest time period compatible with the requisite response.

Side-effects: Clinical studies have indicated an extremely low incidence of side-effects due to Estrovis: very rarely, nausea and vomiting have been reported.

Overdosage: Acute overdosage is seldom attended by any symptoms though there may be nausea and vomiting. Treatment is rarely required except symptomatically.

Pharmaceutical precautions Store in a cool dry place, not exceeding 25°C.

Legal category POM.

Package quantities Estrovis Tablets are supplied in packs of 2 or 20 designed so that the tablets may be dispensed one or two at a time.

Further information Nil.

Product licence number 0019/5009.

GELUSIL* SUSPENSION

Presentation A viscous white suspension, each 5 ml containing:

Magnesium Trisilicate Ph Eur	620 mg
Dried Aluminium Hydroxide Gel BP	310 mg

Uses Gelusil Suspension is a liquid antacid indicated for the relief of hyperacidity, indigestion and heartburn when occurring alone or in association with peptic ulcer.

Dosage and administration *Adults:* One to four 5 ml

spoonfuls of the liquid to be administered with water after meals or whenever symptoms arise.

Children (6–12 years): Half the adult dose.

Contra-indications, warnings, etc

Contra-indications: None known.

Warnings: None applicable.

Precautions: Prolonged or intensive therapy in patients with severe renal insufficiency may lead to hypermagnesaemia.

Side-effects: None is observed at the therapeutic dosage.

Overdosage: Symptoms are unlikely and treatment is rarely required.

Pharmaceutical	precautions	No	special
precautions.			

Legal category GSL.

Package quantities Gelusil Suspension is packed in clear glass bottles containing 200 ml.

Further information Nil.

Product licence number 0019/5012.

GELUSIL* TABLETS

Presentation A white bevel-edge tablet containing:

Magnesium Trisilicate Ph Eur	500 mg
Dried Aluminium Hydroxide Gel BP	250 mg

Uses Gelusil is an antacid indicated for the relief of gastric hyperacidity, indigestion and heartburn when occurring alone or in association with peptic ulcer.

Dosage and administration *Adults:* One or two tablets to be chewed or sucked after meals or whenever symptoms arise.

Children (6–12 years): Half the adult dose.

Contra-indications, warnings, etc

Contra-indications: None known.

Warnings: None applicable.

Precautions: Prolonged or intensive therapy in patients with severe renal insufficiency may lead to hypermagnesaemia.

Gelusil tablets contain 561 mg sugar per tablet and due care should be taken when it is prescribed for patients with diabetes mellitus.

Side-effects: None is observed at the therapeutic dosage.

Overdosage: Symptoms are unlikely and treatment is rarely required.

Pharmaceutical	precautions	No	special
precautions.			

Legal category GSL.

Package quantities Gelusil Tablets are packed in bottles containing 250 and 500 tablets and in foil-wrapped tubes of 20 and 50.

Further information Nil.

Product licence number 0019/5011.

LENTIZOL*

Presentation Capsules containing 50 mg Amitriptyline Hydrochloride BP – white pellets in a size 2 capsule with a pink body and a red cap.

Capsules containing 25 mg Amitriptyline Hydrochloride BP – white pellets in a size 3 all-pink capsule.

The pellets are prepared in a special sustained-release presentation which allows the active constituent to be released over a period of up to 12 hours.

Uses Symptoms of depressive illness especially when sedation is required.

Dosage and administration *Adults and adolescent over 16 years old:* – Oral administration.

Initially 50–100 mg as a single dose at night, increasing to 200 mg/day according to clinical response. Maintenance dose 50–100 mg at night.

Elderly

25–75 mg a day initially. The initial dose should be increased with caution under close supervision. Half the normal maintenance dose may be sufficient to produce a satisfactory clinical response.

Children (under 16 years)

Not recommended.

Use in pregnancy: Do not use during pregnancy especially during the first and last trimesters, unless there are compelling reasons. There is no, or inadequate evidence of safety of the drug in human pregnancy although it has been in wide use for many years without apparent ill-consequence. There is evidence of harmful effects in pregnancy in animals, when given in exceptionally high doses.

Contra-indications, warnings, etc

Contra-indications: Recent cardiac infarction and patients with any degree of heart block or disorders of cardiac rhythm. Patients with mania, severe liver disease or known hypersensitivity to dibenzazepines. Lentizol should not be given to mothers during breast feeding.

Precautions: The elderly are particularly liable to experience adverse reactions, especially agitation, confusion and postural hypotension (see Dosage).

Unless essential it is inadvisable to combine Lentizol with ECT.

Avoid if possible in patients with narrow angle glaucoma, symptoms suggestive of prostatic hypertrophy and a history of epilepsy. Lentizol should be used with caution in hyperthyroid patients.

Patients posing a high suicidal risk require close initial supervision.

Tricyclic anti-depressants potentiate the central nervous depressant action of alcohol.

Anaesthetics given during tri/tetracyclic anti-depressant therapy may increase the risk of arrhythmias and hypotension. If surgery is necessary, the anaesthetist should be informed that a patient is being so treated.

Drug interactions: Lentizol should not be administered concurrently or within 14 days of termination of treatment with MAO inhibitors. It should not be given with directly acting sympathomimetics, and should be used with caution when administered concurrently with anticholinergic drugs.

Lentizol may counteract the effect of adrenergic neurone blocking agents, and possibly clonidine, and therefore it would be advisable to review all anti-hypertensive therapy during treatment.

The action of Lentizol may be decreased by barbiturates, and potentiated by methyl phenidate.

Warnings: As improvement may not occur during the first 2–4 weeks of treatment, patients should be closely monitored during this period.

Amitriptyline may initially impair alertness. Patients could be warned of the possible hazard when driving or operating machinery.

Cardiac arrhythmias and severe hypotension are likely to occur with high dosage or in deliberate overdose. They may also occur in patients with pre-existing heart disease taking normal dosage.

Adverse effects: The following adverse effects, although not necessarily all reported with amitriptyline, have occurred with other tricyclic anti-depressants.

Amitriptyline may produce excessive perspiration and has some anticholinergic activity which may cause dryness of mouth, blurred vision, constipation, tachycardia and urinary retention. These symptoms are common but usually lessen on continuing therapy.

Other common adverse effects include postural hypotension, tremor and skin rashes. Interference with sexual function, nausea, anorexia and dizziness may also occur. Drowsiness may occur in some patients but this is usually controlled by reducing the dose. If necessary the dose may subsequently be gradually increased.

Serious adverse effects are rare; those reported include:

depression of the bone marrow, including agranulocytosis, cholestatic jaundice, hypomania, convulsions and peripheral neuropathy, paralytic ileus.

Psychotic manifestations, including mania and paranoid delusions, may be exacerbated during treatment with tricyclic anti-depressants.

Withdrawal symptoms may occur on abrupt cessation of therapy and include insomnia, irritability and excessive perspiration.

Adverse effects such as withdrawal symptoms, respiratory depression and agitation have been reported in neonates whose mothers had taken amitriptyline during the last trimester of pregnancy.

Precautions: Amitriptyline exerts an anticholinergic effect as well as antihistamine and adrenaline blocking actions. Large doses produce convulsions, coma, apnoea and cardiac irregularities, with intestinal stasis.

Treatment: Gastric lavage and emesis if appropriate. Vital signs should be continuously monitored and patients should be treated in ICUs wherever possible. General supportive measures with careful attention to electrolyte balance. Cardiac irregularities may need controlling with antiarrhythmic drugs and physostigmine salicylate is also indicated. Forced diuresis and haemodialysis have no place in treatment.

Pharmaceutical precautions Store in a dry place at temperature not exceeding 25°C.

Legal category POM.

Package quantities 50 mg: Bottles containing 50 and 250 capsules.

5 mg: Bottles containing 50 and 250 capsules.

Further information Nil.

MUCOLEX

Presentation *Mucorex Syrup*: Clear reddish syrup with a raspberry-menthol flavour containing carbocysteine 250 mg/5ml.

Mucorex Tablets: Round, convex orange tablet, each tablet containing 375 mg carbocysteine.

Uses Mucolytic agent for use in disorders of the respiratory tract in which an increase in the amount or viscosity of mucus is a prominent feature.

Dosage and administration Oral administration.

Mucorex Syrup: **Adults**: Three 5 ml spoonfuls three times a day initially; after a satisfactory response, this may be reduced to two 5 ml spoonfuls three times daily.

Children: (6–12 years): One 5 ml spoonful three times a day.

(2–5 years): 5–10 ml daily in divided doses.

Not recommended for children under 2 years.

Mucorex Tablets: **Adults**: Two tablets three times daily initially, after a satisfactory response, this may be reduced to one tablet four times daily.

Children: Not recommended.

Contra-indications, warnings, etc Carbocysteine is contra-indicated in cases of peptic ulcer, and is not recommended during the first trimester of pregnancy.

Treatment of overdose: Gastric lavage and supportive therapy.

Pharmaceutical precautions Protect from light.

Legal category POM.

Package quantities

Mucorex Syrup is contained in 250 ml glass bottles.

Mucorex Tablets are available in containers of 100.

Further information Nil.

Mucorex Tablets 0019/0069

NARDIL

Presentation Orange, sugar-coated tablets each containing 15 mg phenelzine (as the Sulphate BP).

Uses Phenelzine is a monoamine oxidase inhibitor. Nardil is indicated as follows:

Symptoms of depressive illness, especially where phobic symptoms are present or where treatment with other anti-depressants has failed.

Dosage and administration **Adults**: Oral administration.

One 15 mg tablet three times a day. A response is usually seen within the first week. If no response is evident after two weeks, the dosage may be increased to a maximum of one 15 mg tablet four times a day. Doses of up to two 15 mg tablets three times a day may be used in hospitals. The effectiveness of the drug may not become apparent in less than four weeks' therapy. After a satisfactory response has been achieved, the dosage may be reduced very gradually to a suitable maintenance level. This may be as low as one 15 mg tablet every other day.

Children: Nardil is not indicated for children.

Contra-indications, warnings, etc

Contra-indications: Nardil should not be given where there is any history of hepatic damage or insufficiency. Toxic hepatitis due to Nardil, as well as other monoamine oxidase inhibitors, has been reported. Incidence is low, occurring no more than once in every 37,500 courses of

treatment with Nardil. Contra-indicated in cerebrovascular disease. In general tricyclic anti-depressants, e.g. clomipramine, imipramine, desipramine, butriptyline, nortriptyline, protriptyline, should not be given with, or within 14 days of treatment with MAOI therapy; although it is recognised that there is some division of consultant opinion on this matter.

Nardil tablets contain gluten and are therefore contra-indicated in coeliac disease or gluten enteropathy.

Use in pregnancy: Do not use during pregnancy, especially during the first and last trimesters, unless there are compelling reasons. There is no evidence as to drug safety in human pregnancy nor is there evidence from animal work that it is free from hazard.

Precautions: Nardil may potentiate the action of pethidine, morphine, adrenaline, amphetamines and other sympathomimetic amines such as fenfluramine, ephedrine, phenylpropanolamine, dopamine and levodopa. Many patients on Nardil react quite normally to therapeutic doses of pethidine or morphine. However, if it is necessary to administer either of these drugs to a patient on Nardil, a trial dose of one-tenth to one-fifth of the normal dose should be given initially. If this is without adverse effect the dosage may be built up to the normal over a further period of two to three hours. Nardil may also potentiate the effects of anti-hypertensives, hypoglycaemic agents, sympathomimetics, anti-parkinson drugs, local anaesthetics and CNS depressants including barbiturates.

Nardil should be withdrawn two weeks before elective surgery/dentistry.

Patients under treatment with Nardil should avoid cheese, cooked or plain, and foods containing a high proportion of degraded protein – Oxo, Bovril, Marmite, etc – during treatment, and up to 14 days after ceasing treatment. Flavoured textured vegetable protein, hung game, pickled herrings or broad bean pods may also present a hazard. Patients should severely restrict their alcohol intake and heavy red wines, particularly Chianti, should be avoided completely. Patients should be warned against self-medication, particularly cold cures. Where a reaction between Nardil and certain foodstuffs occurs the intensity of the reaction is usually related to the tyramine content of the food. The reaction is now well recognised and serious hypertensive episodes are extremely rare. Should such a reaction occur, the hypertension should promptly be controlled by slow administration of phentolamine 5–10 mg i.v., repeated if necessary. Care should be taken in administering Nardil with trimipramine or amitriptyline.

Nardil should only be used with great caution in elderly or agitated patients, or those who have cardiovascular disease, epilepsy, blood dyscrasias, phaeochromocytoma or patients with liver toxicity, or diabetes; patients taking diuretics. Nardil may also potentiate the effects of alcohol.

Warnings and adverse effects: Minor side-effects are: dizziness, drowsiness, weakness and fatigue, oedema and gastro-intestinal disturbances (nausea, vomiting, dryness of the mouth, constipation), insomnia, blurred vision, adverse effects on driving ability and postural hypotension. Less common side-effects are: headache, nervousness, euphoria, paraesthesia, sweating, increased appetite and weight, rash, difficulty in micturition, muscle tremor, peripheral neuritis, behavioural changes, arrhythmias, convulsions, impotence and delayed ejaculation, purpura and blood dyscrasias.

Overdosage: Large doses may produce hypomania, followed by coma with hypotension, or acute hypertension with sometimes sub-arachnoid haemorrhage. In a few cases, extra-pyramidal symptoms have been recorded. Treatment – gastric lavage (tablets dissolve slowly in stomach). Absolute bed rest: raise feet in hypotension. Vasopressors are best avoided. Hypertension should be urgently controlled with phentolamine i.v. Avoid hypnotics, such as morphine, pethidine, barbiturates. Use phenothiazine derivatives (chlorpromazine) to control restlessness and intravenous therapy maintain fluid and electrolyte balance. In deep coma a severe hypotension hydrocortisone by injection may be tried. There is no specific antidote for Nardil.

Pharmaceutical precautions Store in a dry place at a temperature not exceeding 25°C.

Legal category POM.

Package quantity Bottles of 100 tablets.

Further information Nil.

Product licence number 0019/5018R.

OPILON* AMPOULES

Presentation Ampoules containing a sterile, colourless aqueous solution, free from turbidity and foreign particles. Each 1 ml Opilon Ampoule contains:

Thymoxamine hydrochloride BP	5.65 mg
(Moxisylyte Hydrochloride INN)	
equivalent to thymoxamine base	5.00 mg

Each 2 ml Opilon Forte Ampoule contains:

Thymoxamine hydrochloride BP	33.92 mg
(Moxisylyte Hydrochloride INN)	
equivalent to thymoxamine base	30.00 mg

Uses All conditions characterised by peripheral ischaemia responsive to alpha adrenergic blockade.

Intra-arterially, to counteract vasospasm in reconstructive surgery and before withdrawal of a needle catheter.

As an intra-arterial perfusion for treatment of rest pain and incipient gangrene.

Dosage and administration *Adults:* Parenteral administration.

1. As a single dose of 0.1 mg/kg body weight i.v. The dose may be given four times a day.

2. As a single dose of 0.1 mg/kg body weight i.v. which may be followed by oral therapy.

3. As an intra-arterial perfusion for treatment of rest pain and incipient gangrene. It is not recommended that this technique be carried out prior to consultation with the Product Licence Holder.

4. As a single dose of 5 mg into the distal end of an artery following arterial surgery or before withdrawal of a cardiac catheter.

Children: No dose recommended.

Contra-indications, warnings, etc

Contra-indications: Hypersensitivity to any of the ingredients.

Warnings: The alpha adrenergic blocking action of Opilon may potentiate the effect of a number of drugs used in the management of hypertension. In practice with the recommended dosage of Opilon, difficulties have not been reported.

Precautions: Opilon should be used with caution in diabetes, theoretically, insulin requirements may be reduced. Tricyclic antidepressants may increase any potent effect produced by α -blockade. Opilon could also be used with caution in patients with anginal symptoms and in subjects who have had a recent coronary infarction.

The safety of Opilon for use during pregnancy and lactation has not been established.

Side-effects: Occasionally mild nausea, diarrhoea, vertigo, headache, and facial flushing may be encountered. These are, however, rare and transient.

Overdosage: In excessive overdosage, a fall in blood pressure is the main symptom. Nurse in head-down position and give an i.v. infusion of noradrenaline until the blood pressure has been restored to normal.

Pharmaceutical precautions Store at a temperature 2–8°C. Do not freeze. Protect from light.

Legal category POM.

Package quantities Opilon and Opilon Forte Ampoules are supplied in boxes of 10.

Further information Nil.

Product licence numbers

Opilon Ampoules 0019/5019

PILON* TABLETS

Presentation Pale yellow, bi-convex tablets approximately 11 mm in diameter debossed 'Opilon' on one side and a bisecting score on the other. Each tablet contains:

Thymoxamine hydrochloride BP	45.22 mg
Moxisylyte Hydrochloride INN(M)	
Equivalent to thymoxamine base	40.00 mg

Uses Thymoxamine is an α adrenergic blocking agent. Opilon is indicated in all conditions characterised by peripheral ischaemia responsive to α adrenergic blockade, in particular those due to vasospasm such as Raynaud's phenomenon, chilblains, acrocyanosis, erythrocyanosis, excessively cold hands and feet and labyrinthine ischaemia (Ménière's syndrome).

Dosage and administration *Adults* – Oral administration.

One tablet to be swallowed four times a day. For those conditions affected by climatic environment 1 tablet should be administered every three hours during the 12-hour period when symptoms are most likely to occur.

Children: Opilon is not indicated for use in children.

Contra-indications, warnings, etc

Contra-indications: Hypersensitivity to any of the ingredients.

Warnings: The α adrenergic blocking action of Opilon may potentiate the effect of a number of drugs used in the management of hypertension. In practice, with the recommended dosage of Opilon, difficulties have not been reported.

Precautions: Opilon should be used with caution in diabetes, theoretically, insulin requirements may be reduced. Tricyclic antidepressants may increase any hypotensive effect produced by α -blockade. Opilon should also be used with caution in patients with anginal

symptoms and in subjects who have had a recent coronary infarction.

The safety of Opilon for use during pregnancy and lactation has not been established.

Side-effects: Occasionally mild nausea, diarrhoea, vertigo, headache and facial flushing may be encountered. These are, however, rare and transient.

Overdosage: In excessive overdosage, a fall in blood pressure is the main symptom. Nurse in head-down position and give an i.v. infusion of noradrenaline until the blood pressure has been restored to normal.

Pharmaceutical precautions Store in a cool dry place, not exceeding 30°C.

Legal category POM.

Package quantities Opilon is supplied in bottles containing 50 and 250 tablets.

Further information Nil.

Product licence number 0019/5021.

ORALDENE*

Presentation A clear, red-coloured solution containing hexetidine 0.10%.

Uses Oraldene is an anti-infective agent indicated for mouth infections such as gingivitis, pyorrhoea, stomatitis. Also of value in aphthous ulcers, dental ulcers, halitosis, pre- and post-dental surgery and oral thrush and in geriatric nursing. It is also of value as an adjuvant to systemic therapy in tonsillitis and pharyngitis.

Dosage and administration *Adults and children:* Rinse the mouth or gargle with at least 15 ml of Oraldene two to three times a day. Oraldene should not be diluted.

Contra-indications, warnings, etc

Contra-indications: None known.

Warning: Oraldene is not to be taken internally.

Precautions: None applicable.

Side-effects: Very rarely, mild local irritation of the buccal tissues.

Overdosage: Hexetidine is a bactericide and fungicide. It is non-toxic in the strength used in this preparation. Acute intoxication with alcohol contained in the vehicle is unlikely even with massive doses.

Treatment: Treatment is rarely necessary.

Pharmaceutical precautions Store away from direct light.

Legal category GSL.

Package quantities Oraldene is supplied in clear glass bottles containing 100 ml, 200 ml and 1 litre (this size for hospital use only).

Further information Nil.

Product licence number 0019/5022.

RINUREL* LINCTUS

Presentation Yellow-coloured linctus. Each 5 ml contains:

Paracetamol Ph Eur	150.00 mg
Phenylpropanolamine Hydrochloride BP	12.50 mg

Phenyltoloxamine citrate	11.00 mg
Pholcodine Ph Eur	5.00 mg

Uses Rinurel Linctus provides analgesic, antipyretic, decongestant, antihistamine and antitussive properties.

Rinurel Linctus is indicated for symptomatic relief of unproductive cough, headache, sinus and facial pain, nasal and sinus congestion often associated with acute and chronic sinusitis, allergic and vasomotor rhinitis and upper and lower respiratory tract infections including influenza and the common cold.

Dosage and administration *Adults:* Two 5 ml spoonfuls to be taken orally four times daily.

Children (6–12 years): One 5 ml spoonful to be taken orally four times daily.

(2–5 years): 2.5 ml to be taken orally four times daily.

Contra-indications, warnings, etc

Contra-indications: Contra-indicated in persons whose sensitivity to small doses of sympathomimetic agents is manifested by sleeplessness, dizziness, light-headedness, weakness, tremors or cardiac arrhythmias.

Warnings: If drowsiness occurs, patients should not drive or operate machinery.

Alcohol or barbiturates should not be taken concomitantly.

Precautions: Caution should be exercised in patients with hyperthyroidism, hypertension, cardiac dysfunction, diabetes mellitus and liver disorders. Rinurel Linctus should not be used during treatment with MAO inhibitors or for two weeks after completion of therapy.

Not recommended during the first trimester of pregnancy.

Side-effects: Drowsiness, dryness of mouth and mild stimulation have been occasionally reported.

Overdosage: Drowsiness, palpitations, weakness and inco-ordination. Later delayed acute liver failure.

Treatment: Gastric lavage. If possible check plasma paracetamol level. Within 10 hours of ingestion give methionine orally or cysteamine i.v. Otherwise take generally supportive measures.

Pharmaceutical precautions No special precautions.

Legal category P.

Package quantities Bottles containing 200 ml.

Further information Rinurel Linctus may be diluted with Syrup BP when prescribing for young children.

Product licence number 0019/5031.

RINUREL* TABLETS

Presentation Pink tablets, scored once. Each tablet contains:

Paracetamol Ph Eur	300.0 mg
Phenylpropanolamine Hydrochloride BP	25.0 mg
Phenyltoloxamine citrate	22.0 mg

Uses Rinurel Tablets provide analgesic, antipyretic, decongestant and antihistamine properties.

Rinurel Tablets are indicated for the symptomatic relief of headache, sinus and facial pain, nasal and sinus congestion often associated with acute and chronic sinusitis, allergic and vasomotor rhinitis, influenza and the common cold.

Dosage and administration *Adults:* 2 tablets to be swallowed initially, followed by 1 tablet every four hours. Do not exceed 6 tablets in 24 hours.

Children (5–12 years): Half adult dose.

Contra-indications, warnings, etc

Contra-indications: Contra-indicated in persons whose sensitivity to small doses of sympathomimetic agents manifested by sleeplessness, dizziness, light-headedness, weakness, tremors or cardiac arrhythmias.

Warnings: If drowsiness occurs, patients should not drive or operate machinery.

Alcohol or barbiturates should not be taken concomitantly.

Precautions: Caution should be exercised in patient with hyperthyroidism, hypertension, cardiac dysfunction, diabetes mellitus and liver disorders. Rinurel should not be used during treatment with MAO inhibitors or for two weeks after completion of therapy.

Not recommended during the first trimester of pregnancy.

Side-effects: Drowsiness, dryness of mouth and mild stimulation have been occasionally reported.

Overdosage: Drowsiness, palpitations, weakness and inco-ordination. Later delayed acute liver failure.

Treatment: Gastric lavage. If possible check plasma paracetamol level. Within 10 hours of ingestion give methionine orally or cysteamine i.v. Otherwise take generally supportive measures.

Pharmaceutical precautions Store in a dry place.

Legal category P.

Package quantity Bottles containing 250 tablets.

Further information Nil.

Product licence number 0019/5029.

RINUREL* SA TABLETS

Presentation Pink, oval-shaped tablets, two layered and scored once. Each tablet contains:

Paracetamol Ph Eur	600.0 mg
Phenylpropanolamine Hydrochloride BP	100.0 mg
Phenyltoloxamine citrate	66.0 mg

Uses Rinurel SA Tablets provide analgesic, antipyretic, decongestant and antihistamine properties.

Indicated for prolonged symptomatic relief of headache, sinus and facial pain, nasal and sinus congestion often associated with acute and chronic sinusitis, allergic and vasomotor rhinitis, influenza and the common cold.

Dosage and administration *Adults:* 1 tablet to be swallowed whole every 12 hours.

Children (5–12 years): Half adult dose.

Contra-indications, warnings, etc

Contra-indications: Contra-indicated in persons whose sensitivity to small doses of sympathomimetic agents is manifested by sleeplessness, dizziness, light-headedness, weakness, tremors or cardiac arrhythmias.

Warnings: If drowsiness occurs, patients should not drive or operate machinery.

Alcohol or barbiturates should not be taken concomitantly.

recautions: Caution should be exercised in patients with hyperthyroidism, hypertension, cardiac dysfunction, diabetes mellitus and liver disorders. Rinurel SA tablets should not be used during treatment with MAO inhibitors or for two weeks after completion of therapy. Not recommended during the first trimester of pregnancy.

ide-effects: Drowsiness, dryness of mouth and mild stimulation have been occasionally reported.

verdosage: Drowsiness, palpitations, weakness and inco-ordination. Later delayed acute liver failure.

reatment: Gastric lavage. If possible check plasma acetamol level. Within 10 hours of ingestion give methionine orally or cysteamine i.v. Otherwise take generally supportive measures.

harmaceutical precautions Store in a dry place.

egal category POM.

ackage quantity Bottles containing 250 tablets.

urther information Nil.

roduct licence number 0019/5030.

TEDRAL* TABLETS

resentation Each white, bi-convex tablet contains:

Theophylline Ph Eur	120 mg
Ephedrine Hydrochloride Ph Eur	24 mg

Uses Tedral is for symptomatic relief of bronchospasm in bronchial asthma, chronic bronchitis and hay fever.

Dosage and administration Oral. *Adults:* 1 tablet every four hours.

Children (6–12 years): $\frac{1}{2}$ tablet every four hours, preferably after meals.

Contra-indications, warnings, etc

Contra-indications: Sensitivity to any of the ingredients.

Precautions and warnings: Tedral should not be administered to patients who are being treated with MAO inhibitors, or have received them within the preceding 14 days. It should not normally be administered during pregnancy and lactation. It should be used with caution in patients who are suffering from cardiovascular disorders, severe hypertension, hyperthyroidism, prostatic hypertrophy or glaucoma.

Side-effects: Difficulty in micturition, mild epigastric distress, palpitations, tremulousness, insomnia and CNS stimulation have been reported.

Overdosage: Irritation of alimentary tract. Nausea, vomiting and giddiness.

Treatment: Gastric lavage. Use general supportive measures.

Pharmaceutical precautions No special precautions.

Legal category POM.

Package quantities Tedral Tablets are packed in brown glass bottles containing 50 and 500 tablets.

Further information Nil.

Product licence number 0019/5036.

TEDRAL* EXPECTORANT

Presentation Tedral Expectorant is a clear viscous liquid with an orange-ginger taste, each 5 ml containing:

Diprophylline Ph Eur	100 mg
Ephedrine Hydrochloride Ph Eur	10 mg
Guaiphenesin BPC 1973	50 mg

Uses Tedral Expectorant is a bronchodilator and expectorant indicated in chronic bronchitis, coughs associated with bronchial congestion, influenza, bronchial asthma associated with retained bronchial secretions, and other conditions where tenacious sputum is a problem.

Dosage and administration *Adults:* Two 5 ml spoonfuls every four hours, preferably after meals.

Children (6–12 years): One 5 ml spoonful every four hours, preferably after meals.

Contra-indications, warnings, etc

Contra-indications: Sensitivity to any of the ingredients.

Precautions and warnings: Tedral Expectorant should not be administered to patients who are receiving MAO inhibitors, or who have received them within the preceding 14 days. It should not normally be administered during pregnancy and lactation. It should be used with caution in patients who are suffering from cardiovascular disorders, severe hypertension, hyperthyroidism, prostatic hypertrophy or glaucoma.

Side-effects: Difficulty in micturition, mild epigastric distress, palpitation, tremulousness, insomnia and CNS stimulation have been reported.

Overdosage: Irritation of alimentary tract. Nausea, vomiting and giddiness.

Treatment: Gastric lavage. Use general supportive measures.

Pharmaceutical precautions Store at a temperature, not exceeding 25°C.

Legal category POM.

Package quantities Tedral Expectorant is available in brown glass bottles containing 200 ml.

Further information Nil.

Product licence number 0019/0039.

TEDRAL* SA

Presentation A double-layered tablet consisting of a mottled coral colour, sustained-release layer and a white with pink mottled, immediate-release layer. Each tablet contains:

Theophylline Ph Eur	180.0 mg
Ephedrine Hydrochloride Ph Eur	48.0 mg

Uses Tedral SA is for symptomatic relief of bronchospasm in bronchial asthma, chronic bronchitis and hay fever.

Dosage and administration Oral. *Adults:* 1 tablet in the morning and 1 tablet 12 hours later.

Children (6–12 years): $\frac{1}{2}$ tablet in the morning and $\frac{1}{2}$ tablet 12 hours later, preferably after meals. The tablet should be cut from the pink layer through to the white layer.

Contra-indications, warnings, etc

Contra-indications: Sensitivity to any of the ingredients.

Precautions and warnings: Tedral SA should not be administered to patients who are receiving MAO inhibitors, or who have received them within the preceding 14 days. It should not normally be administered during pregnancy and lactation. It should be used with caution in patients who are suffering from cardiovascular disorders, severe hypertension, hyperthyroidism, prostatic hypertrophy or glaucoma.

Side-effects: Difficulty in micturition, mild epigastric distress, palpitations, tremulousness, insomnia and CNS stimulation have been reported.

Overdosage: Irritation of alimentary tract. Nausea, vomiting and giddiness.

Treatment: Gastric lavage. Use general supportive measures.

Pharmaceutical precautions No special precautions.

Legal category POM.

Package quantities Tedral SA Tablets are packed in bottles containing 100 and 500 tablets.

Further information Nil.

Product licence number 0019/5037.

VEGANIN*

Presentation White scored tablets containing:

Paracetamol Ph Eur	250.0 mg
Aspirin Ph Eur	250.0 mg
Codeine Phosphate Ph Eur	6.80 mg

Uses Veganin provides analgesic and antipyretic properties. It is indicated in influenza and other conditions which require an antipyretic and for all kinds of mild to moderate pain, especially headache, dysmenorrhoea, rheumatism and toothache.

Dosage and administration Oral. *Adults:* 1 or 2 tablets to be swallowed every three to four hours up to a maximum of 8 tablets in 24 hours.

Children (6–12 years): Half to one tablet to be swallowed every four hours up to a maximum of four tablets in 24 hours.

(under 6 years): Not recommended.

Contra-indications, warnings, etc

Contra-indications: Hypersensitivity to any of the components. Veganin is contra-indicated in patients suffering from active peptic ulceration and haemophilia.

Precautions and drug interactions: There is clinical and epidemiological evidence of safety of aspirin and paracetamol in human pregnancy, but the safety of codeine in pregnancy has not been established. Aspirin may prolong labour and contribute to maternal and neonatal bleeding and is best avoided at term. Aspirin may increase the anticoagulant effects of coumarin derivatives, and inhibit the action of uricosurics. It may also precipitate bronchospasm and induce attacks of asthma in susceptible subjects. Veganin should be used with caution in patients with impaired renal or hepatic function.

Warnings and adverse effects: Codeine is a narcotic analgesic and tolerance, psychological and physical dependence and constipation may occur. Aspirin may induce gastro-intestinal haemorrhage, which may very occasionally be severe.

Overdosage: Nausea, dizziness, ataxia, tinnitus, deafness, vomiting, electrolyte imbalance, delayed acute liver failure. An overdose can cause hepatic necrosis.

Treatment: Urgently check plasma levels of acetylsalicylic acid and paracetamol. If the a.s.a. level is above 50 mg/100 ml use forced alkaline diuresis. If more than 30–40 tablets taken and within 10 hours of ingestion give methionine immediately by mouth or acetylcysteine i.v.

Pharmaceutical precautions Store in a dry place.

Legal category P.

Package quantities Veganin is supplied in blister packs containing 10, 20 and 50 tablets.

Further information Nil.

Product licence number 0019/5041R.

*Trade Mark

VB Pharmaceuticals Limited

P.O. Box 23

Bracknell

Berkshire RG12 4YS

EROTEC*

Presentation Pressurised metered inhaler: 10 ml vial (200 metered doses) available as complete unit with mouthpiece. Each metered dose contains fenoterol hydrobromide 0.2 mg (0.18 mg available to the patient).

Uses *Action:* Berotec is a highly potent, rapidly acting, selective β_2 - adrenergic stimulant with a duration of action of 6-8 hours. The degree of selectivity coupled with administration by inhalation allows maximal bronchodilator effect with minimal side-effects.

Indications: For the treatment of reversible airways obstruction as in bronchial asthma, bronchitis and emphysema.

Dosage and administration By inhalation.

As Berotec has a longer duration of action than other bronchodilators a dosage of 1 or 2 puffs three times daily is usually sufficient to control bronchospasm in adults. If necessary this may be increased up to 2 puffs every four hours. Children (6-12 years) will normally require 1 puff three times daily but this may be increased up to 1 puff every four hours if necessary. It is recommended that administration of Berotec to children should be supervised by a responsible adult.

Contra-indications, warnings, etc

Contra-indications: There are no absolute contra-indications to the use of Berotec.

Precautions: Caution should be observed should it be necessary to administer Berotec to patients with thyrotoxicosis, myocardial insufficiency, angina, cardiac dysrhythmias, hypertension or hypertrophic subvalvular aortic stenosis.

In view of the possible interaction between sympathomimetic amines and monoamine oxidase inhibitors or cyclic anti-depressants, care should be exercised if it is proposed to administer these compounds concurrently with Berotec.

Berotec should be used with caution in patients already receiving other sympathomimetic agents as cardiovascular effects may be additive.

Patients must be instructed in the correct use of a metered inhaler and warned not to exceed the prescribed dose. If relief is not obtained after correct use of the inhaler, the dose should not be exceeded and the patient should contact the doctor for advice.

Although Berotec has been in wide general use for several years, there is no definite evidence of ill consequence during human pregnancy. Animal studies have shown no hazard.

Berotec treatment may result in the prolongation of pregnancy and inhibition of labour.

Medicines should not be used in pregnancy, especially the first trimester, unless the expected benefit is thought to outweigh any possible risk to the foetus.

Beta-adrenergic blocking agents may antagonise berotec and reduce its bronchodilator effect if administered concurrently.

A temporary dose-related decrease in serum potassium levels has been observed in some patients.

Side-effects: Transient sympathomimetic side-effects, such as palpitation, tachycardia, headache and tremor may occur, as with other beta-adrenergic agonists, but are uncommon with administration by inhaler.

Overdosage: Accidental overdosage may give rise to tachycardia, palpitation and tremor. It is suggested that the patient should be treated symptomatically.

Should the administration of a beta-adrenergic blocking agent be considered necessary to counteract the effects of overdosage, its use in a patient liable to bronchospasm should be carefully monitored.

Pharmaceutical precautions Protect from heat, including the sun.

The inhaler vial should not be incinerated or opened even when empty.

Legal category POM.

Package quantities 10 ml vial (200 metered doses) complete with mouthpiece.

Further information There is evidence to suggest that Berotec may reduce the allergic response of tissues. Animal studies have shown that Berotec also produces an increase in the frequency of movement of the respiratory epithelial cilia and in the rate of mucus transport.

Long-term use has shown Berotec to be free from significant adverse effects, particularly with respect to the blood gases and general biochemistry. Tolerance is not a feature of long-term use.

Product licence number 0015/0034.

CELEVAC*

Presentation Methylcellulose 450 BP as pink granules containing 64% and pink tablets containing 500 mg.

Uses *Action:* Methylcellulose is a hydrophilic colloid which absorbs water to swell to a soft gel of uniform consistency.

Indications:

1. Colostomy, ileostomy and simple diarrhoea.
2. Diverticular disease and ulcerative colitis.
3. Simple constipation.
4. Obesity.
5. Liquid and tube fed diets.

Dosage and administration

1. *Colostomy and ileostomy control and for simple diarrhoea:* 1-2 level 5 ml spoonfuls of granules (or 3-6 tablets) twice daily with the minimum of liquid. Liquids should be avoided for 30 minutes before and after each dose. Dosage should be adjusted to give stools the required consistency.

2. *Diverticular disease and ulcerative colitis:* 3-6 tablets

or 1–2 level 5 ml spoonfuls of granules twice daily, adjusted according to the degree of constipation, diarrhoea or spastic pain.

3. **Simple constipation:** 1–2 level 5 ml spoonfuls of granules (or 3–6 tablets) twice daily, to be taken with at least 300 ml of liquid. The dose may be reduced as normal bowel function is restored.

4. **Obesity:** 3 tablets, with at least 300 ml of warm liquid, half an hour before each meal, and between meals when hunger pangs are severe.

5. **Liquid diet and intragastric tube feeding:** 1 level 5 ml spoonful of granules, dispersed in hot water, added to each litre of diet mix.

Contra-indications, warnings, etc Imminent or threatened bowel obstruction. Bowel obstruction is a rare complication of treatment with any bulk-forming hydrophilic colloid.

Although Celevac has been in wide general use for many years there is no evidence of ill-consequence during human pregnancy.

Medicines should not be used in pregnancy, especially the first trimester, unless the expected benefit is thought to outweigh any possible risk to the foetus.

Overdosage: Methylcellulose is not absorbed. The features to be expected would be abdominal distension which may be followed by intestinal obstruction.

Gastric lavage should be employed where appropriate. The patient should be observed and fluids given. If obstruction develops, appropriate measures such as rectal washout must be taken.

Pharmaceutical precautions Protect from heat and moisture.

Legal category GSL.

Package quantities Granules packs of 500 g. Tablets packs of 250.

Further information Methylcellulose is a hydrophilic colloid which bonds loosely with H₂O and with H₂S, thus acting as a bulking agent and a deodorising agent. In diverticular disease its use has been associated with a fall in intracolonic pressures as well as relief of symptoms.

Celevac Granules 1416/5000
Celevac Tablets 1416/5003

DIXARIT®

Presentation Blue, bi-convex, sugar-coated tablets with the Company initials on one side. Each tablet contains clonidine hydrochloride 0.025 mg.

Uses **Action:** Treatment with Dixarit diminishes the responsiveness of peripheral vessels to constrictor and dilator stimuli, thereby preventing the vascular changes associated with migraine. The same direct action on peripheral vessels moderates the vascular changes associated with menopausal flushing.

Indications:

1. The prophylactic management of migraine or recurrent vascular headache.

2. The management of vasomotor conditions commonly associated with the menopause and characterised by flushing.

Dosage and administration **Adults:** Initially 2 tablets

twice daily. If after two weeks there has been a remission, increase to 3 tablets twice daily.

Children: Not generally recommended for administration to children under 12 years.

The duration of treatment depends upon the severity of the condition.

Contra-indications, warnings, etc

Contra-indications: There are no known absolute contraindications to the use of Dixarit.

Precautions: Dixarit may be unsuitable for patients who have co-existing or a previous history of depressive illness, since further depressive episodes have occasionally been reported in such patients.

Although clonidine has been in wide general use for many years there is no definite hazard during human pregnancy.

In animal studies involving doses higher than the equivalent maximum therapeutic dose in man, effects on foetal development were only seen in one species. Foetal malformations did not occur.

Medicines should not be used in pregnancy, especially the first trimester unless the expected benefit is thought to outweigh any possible risk to the foetus.

Using higher doses than those recommended above, clonidine is an effective antihypertensive agent. Caution should therefore be observed where antihypertensive agents are being used as potentiation of hypotensive effect may occur. Provided the recommended Dixarit dosage regimen is followed, no difficulty with hypertension should arise during the routine management of patients with either migraine or menopausal flushing.

Clonidine is available for the management of hypertension as Catapres Tablets (0.10 mg and 0.30 mg Perlongets (0.25 mg) and Ampoules (0.15 mg in 1 ml (Boehringer Ingelheim Ltd). Where Catapres is already being used Dixarit therapy is obviously illogical.

Side-effects: Initially there may be sedation or dry mouth in some patients. Dizziness, nausea and nocturnal urination have been reported, and occasionally rashes have been attributed to Dixarit.

In the management of hypertension a single case of toxic hepatitis has been reported with clonidine. However, the role of clonidine in hepatotoxicity in this patient remains questionable. Monitoring of haematological, renal and hepatic status in large numbers of patients has revealed no drug-related adverse effects.

Overdosage: Accidental overdosage may cause hypotension, bradycardia, sedation and coma. Transient hypertension may be seen if the total is over 10 mg.

Gastric lavage should be performed where appropriate. In most cases all that is required are general supportive measures. Forced diuresis has been employed. Where bradycardia is severe atropine will increase the heart rate. If hypotension is giving rise to concern the administration of an alpha-adrenergic blocking drug such as phentolamine may help.

Pharmaceutical precautions Protect from heat and moisture and light.

Legal category POM.

Package quantities Packs of 100.

Further information There is no information which suggests that Dixarit will interact with any other preparation used routinely in the management of either migraine or menopausal flushing.

Product licence number 0015/5014.

ENDOXYANA®

resentation White, compression-coated tablets containing Cyclophosphamide BP 10 mg or 50 mg; marked /BP E1 on one side and either 10 or 50 on the reverse. /hite powder in vials for injection containing Cyclophosphamide BP 107 mg, 214 mg, 535 mg or 1,069 mg (equivalent to 100 mg, 200 mg, 500 mg or 1,000 mg anhydrous cyclophosphamide, respectively) and sodium chloride sufficient to render isotonic when diluted with water for Injections using the volume recommended for each strength.

ses Action: Cyclophosphamide is a potent alkylating agent although the compound itself is inert until activated by microsomal enzymes. The main organ of activation is the liver. Several of the metabolites are cytotoxic.

indications: Endoxana is a cytotoxic drug for the treatment of malignant disease.

Used as a single agent it has successfully produced an objective remission in a wide range of malignant conditions. Endoxana is also frequently used in combination with other cytotoxic drugs.

osage and administration Endoxana should only be used by clinicians experienced in the use of cytotoxic drugs.

osage: The dose, route of administration and frequency of administration should be determined by the tumour type, tumour staging, the general condition of the patient and whether other chemotherapy or radiation is to be administered concurrently.

A guide to the dosage regimes used for most indications is given below:

ow dose – 2–6 mg/kg (80–240 mg/m²) daily as a single i.v. dose or orally.

Medium dose: 10–15 mg/kg (400–600 mg/m²) as a single i.v. dose weekly.

Large dose: 20–40 mg/kg (800–1600 mg/m²) as a single i.v. dose given at 10–20 day intervals.

High dose: 60–80 mg/kg (2.4–3.2 g/m²) as a single i.v. dose at three to four week intervals.

administration: The dry contents of a vial may be mixed with sterile water (5 ml per 100 mg Endoxana) and used within two hours. The pH of an aqueous solution is between 4.5 and 5.5. Endoxana is usually given directly into the vein over one or two minutes or directly into the tubing of an infusion with the patient supine. It is not recommended that Endoxana be given by infusion over longer than 30 minutes. Should the drug accidentally be given paravenously local tissue damage is unlikely and no specific measures need be taken. Endoxana injection may also be given intraperitoneally, intrapleurally, intrathecally or by local perfusion but these routes offer no therapeutic advantages over the i.v. route. The dosage recommendations are as above.

A minimum urine output of 2–3 l/day should be maintained during therapy to avoid cystitis. If larger doses are used a urine output of 4–5 l/day should be maintained for 24 hours following administration, by a forced alkaline diuresis.

Endoxana should be given during the day so that the bladder may be voided frequently. Nausea and vomiting may be reduced by the prior administration of an antiemetic. Treatment with Endoxana should be temporarily withheld if the leucocyte count is below 4,000/mm³ or the platelet count below 100,000/mm³.

An elixir may be prepared by dissolving the contents

of the dry powder vials in Aromatic Elixir USP shortly before use.

Contra-indications, warnings, etc *Contra-indications:* Endoxana should only be administered under the direction of a specialist oncology service having facilities for regular monitoring of clinical, biochemical and haematological effects during and after administration.

Endoxana is contra-indicated in patients with haematuria or cystitis, with known hypersensitivity, with acute infections, or with bone marrow aplasia.

Endoxana should not be used in the management of non-malignant disease, except for immuno-suppression in life-threatening situations.

Endoxana should not be used in pregnancy, especially the first trimester, unless the expected benefit is thought to outweigh the substantial risk to the foetus.

Contraception is advised during Endoxana therapy and for at least nine months following treatment. Mothers should not breast-feed while being treated with Endoxana.

Precautions: Care should be exercised in patients who are elderly, debilitated, have diabetes mellitus or evidence of myelosuppression or who have recently received radiotherapy or cytotoxic agents.

Endoxana is not recommended in patients with serum creatinine greater than 120 µmol/l, bilirubin greater than 17 µmol/l or with transaminases or alkaline phosphatase more than 2–3 times the normal value.

Increased myelosuppression may be seen following concurrent administration of other marrow depressant drugs.

Endoxana potentiates the hypoglycaemic effects of the sulphonylurea compounds. An alteration in carbohydrate metabolism may be seen in patients on Endoxana.

Side-effects: Nausea and vomiting. This may be reduced by the prior administration of an anti-emetic.

Epilation occurs to some degree in about 20% of patients receiving over 100 mg daily and is inevitable following high doses. Epilation commences usually after the first three weeks of treatment but regrowth is evident after three months in most patients even though they remain on treatment.

The reticulo-endothelial system is depressed, granulopoiesis and lymphopoiesis being more affected than thrombopoiesis and erythropoiesis, but this depression is reversible. Following a single dose the fall in the peripheral white cell count reaches a nadir between 5 to 10 days following administration. Recovery is seen from 10–14 days following administration with full recovery in most cases by 21–28 days. The fall in the peripheral count and the recovery time increase with increasing amounts of Endoxana administered. If the peripheral white cell count is very low, increased risk of infection should be considered but since recovery is usually spontaneous steroids are not recommended.

Cystitis is usually controllable by maintaining an adequate urine output. The daily urine output should never be less than 2–3 litres on low and medium doses and should be increased with larger doses of Endoxana. The administration of a diuretic is sometimes advisable especially with larger doses as Endoxana may cause water retention. Frequent emptying of the bladder is recommended. Endoxana should be withheld from patients with cystitis from any cause, until it has been treated.

Amenorrhoea and azoospermia often occur but can be reversible.

Other side-effects such as pigmentation, macrocytosis, water retention and induction of hyperglycaemia have been reported. Following large doses, ECG changes, elevation of LDH, SGOT and CPK have been reported in some patients.

Endoxana has been shown to be mutagenic, teratogenic and carcinogenic in certain laboratory tests, and, as with other cytotoxic agents, there have been reports of possible drug-induced neoplasia.

Overdosage: The most serious consequences of overdosage are suppression of the reticulo-endothelial system and haemorrhagic cystitis. The former usually recovers spontaneously, but until it does, administration of a broad spectrum antibiotic (or possibly gammaglobulin) may be advisable. Transfusions of whole-blood, platelets or white cells are rarely necessary.

Cystitis should be treated with analgesics and the maintenance of a high urine output by a high IV fluid intake in conjunction with a diuretic if necessary. Haemorrhagic cystitis usually resolves on stopping Endoxana. In severe cases more intensive management may be necessary. Intravesical instillation of 200–300 ml of a 5% formalin solution for 15 minutes followed by a washout with 1 litre distilled water has been successful. Care should be taken to prevent ureteric reflux. If this fails a urological opinion should be sought with a view to bladder tamponade, cautery or surgery. Blood transfusions should also be given if clinically indicated.

No further courses of Endoxana should be given until the patient has fully recovered.

Cardiotoxicity has been observed with high doses of Endoxana. Endoxana should be discontinued and where necessary, treatment with bed-rest, diuretics, oxygen and digitalis should be considered.

Pharmaceutical precautions Store below 30°C; protect from light. The solution for parenteral use should be used within two hours of preparation.

Legal category POM.

HERPID*

Presentation A clear, colourless solution containing Idoxuridine BP in dimethyl sulphoxide, of spectroscopic quality 5%.

Uses Action: The antiviral agent idoxuridine arrests replication of DNA viruses, e.g. varicella/zoster; herpes-virus hominis; vaccinia. The idoxuridine is dissolved in dimethyl sulphoxide which penetrates the skin and carries the antiviral agent to the deeper levels of the epidermis where the virus is replicating.

Indications: Cutaneous herpes simplex and herpes zoster (shingles).

Dosage and administration Herpid should be painted on the lesions and their erythematous bases times daily for four days. Treatment should start as soon as the condition has been diagnosed, ideally within two to three days after the rash appears. Good results are less likely if treatment is not started within seven days.

Contra-indications, warnings, etc

Contra-indications: Animal studies have shown idoxuridine to be teratogenic. Consequently, Herpid should not be prescribed for women who are pregnant or at risk of becoming pregnant. In a small number of cases, women who used Herpid inadvertently in early pregnancy and who were followed to term, the infant was normal in each case.

Known hypersensitivity to either idoxuridine or dimethyl sulphoxide.

Dermographia.

Side-effects: Patients often experience stinging when applying Herpid and a distinctive taste during a course of treatment; both effects are transient.

Over-usage of the solution may lead to maceration of the skin.

Warning: Herpid in the eye causes stinging; treat by washing out with water.

Overdosage: There is no clinical experience of overdosage. Standard supportive measures should be adopted.

Pharmaceutical precautions Herpid should be stored in its box at room temperature. Do not refrigerate as the contents of the bottle may solidify. If crystals do form, allow to redissolve before use.

Because the solution is hygroscopic, any remaining after completion of treatment should be discarded.

Legal category POM.

Package quantities 5 ml bottle, with brush.

Further information Herpid can damage some synthetic materials (e.g. artificial silk and terylene) and printed cotton fabrics. Contact between Herpid and these materials should therefore be avoided.

The use of Herpid in children with malignant disease might be justified but, although not a contra-indication its use in children under the age of 12 years is not recommended.

Product licence number 1416/0001.

HONVAN*

Presentation White tablets marked $\frac{WBP}{H}$ on one side containing tetrasodium fosfestrol 100 mg and 5 ml ampoules containing tetrasodium fosfestrol 276 mg.

Uses Action: Honvan is a water-soluble synthetic oestrogen which is inert until activated by dephosphorylation at sites of high phosphatase (particularly acid phosphatase) activity, releasing high local concentrations of oestrogen which have been demonstrated to exert a cytotoxic effect in animals. The localisation of activity reduces systemic effects, in particular adrenal hypertrophy, often associated with conventional hormonal treatment. Honvan administered in lower oral doses is comparable with conventional hormonal therapy.

Indications: Honvan is a cytotoxic drug for the treatment of all stages of prostatic carcinoma. Honvan may be used as an adjuvant to surgery, in inoperable cases and for the reduction of pain due to metastases. Patients who are resistant to conventional hormone therapy have responded to Honvan. Where acute retention has occurred the use of Honvan may reduce the need for transurethral resection.

Dosage and administration *Initial therapy: Acute retention of urine and Relapse:* 2–4 ampoules Honvan intravenously as a single injection daily for at least five days or until a response has been obtained (seven to ten days). The patient should preferably be lying down and the injection given slowly, directly into the vein. Slow infusions are not recommended as high local cytotoxic levels may not be achieved.

Maintenance: 1 ampoule intravenously one to four times weekly.

Oral maintenance therapy is usually 1–6 tablets daily in divided doses. The initial dose should be up to 2 tablets three times daily for the first week, reducing over the next two weeks to the lowest dose that will control the disease which is usually from 1 to 3 tablets daily in divided doses.

Contra-indications, warnings, etc There are no absolute contra-indications to the use of Honvan. Honvan should only be administered under the direction of a specialist oncology service having facilities for the regular monitoring of clinical, biochemical and haematological effects during and after administration.

Caution is advised when using Honvan in patients with poor cardiac reserve or fluid retention, and in these cases concomitant diuretic therapy may be indicated. In rare cases hypersensitivity to Honvan has been noted.

Honvan should not be administered to pregnant women as oestrogens have been shown to produce a teratogenic effect in the female foetus.

Side-effects: A burning in the perineum and pain in bony metastases may occur during or immediately after intravenous injection. Perineal discomfort may be reduced by prior administration of a sedative.

Nausea and vomiting may occur, but will be less severe than with hormone therapy; oedema and lung congestion have been reported, but there is no evidence of an increased incidence of cardiovascular disease. After prolonged high dosage, feminising side-effects which may occur, due to leak of oestrogen from sites of ephosphorylation, will be less marked than those occurring during conventional hormonal therapy.

Honvan is non-irritant to the veins and should not be injected accidentally into the paravenous tissue no specific action is necessary.

Overdosage: In the event of overdosage, monitoring for fluid retention should be undertaken and in patients with cardiac disease, the administration of diuretics and digitalis should be considered.

Pharmaceutical precautions Store in a cool place. Incompatible with aqueous solutions of pH less than 7 and solutions containing calcium or magnesium ions.

Legal category POM.

Package quantities Ampoules in boxes of 10 × 5 ml. Tablets in containers of 100.

Further information Response to treatment with

Honvan may be objectively assessed by the degree of reduction in plasma acid phosphatase concentrations and by the reduction in size of: the primary prostatic tumour, cutaneous, subcutaneous or lymph node metastases, bone lesions or visceral metastases. Subjective assessment may be made by the reduction in pain, improvement in urinary function and improvement in patient well-being.

Honvan Ampoules	1416/5022

LAXOBERAL®

Presentation A clear, yellowish orange, fruit-flavoured liquid containing sodium picosulphate 5 mg per 5 ml.

Uses Action: Laxoberal contains a synthetic laxative, sodium picosulphate, which is broken down by bacteria in the large intestine to the active substance, bis-(p-hydroxyphenyl)-2-pyridyl methane. A predictable evacuation of soft formed stools occurs usually 10–14 hours after administration.

Indications: Constipation, either recent or chronic, whenever a stimulant laxative is required. Bowel clearance before surgery, labour or radiological investigations.

Laxoberal is suitable for routine use in both adults and children.

Dosage and administration *Adults:* 5–15 ml at night.

Children: 5–10 years: 2.5–5 ml at night.

0–5 years: 2.5 ml at night.

Diluent: Laxoberal may be diluted with purified water.

Contra-indications, warnings, etc

Contra-indications: As with any laxative. Laxoberal should not be given to patients with undiagnosed abdominal pain, or where intestinal obstruction is suspected.

Precautions: It is generally recommended that laxatives should not be given to patients being prepared for barium enema examinations where inflammatory bowel disease, such as ulcerative colitis, is suspected. This recommendation applies also to Laxoberal.

As Laxoberal is broken down by bacteria in the large intestine, it is possible that in patients taking broad-spectrum antibiotics there may be some loss of laxative action.

Although Laxoberal has been in wide general use for many years, there is no evidence of ill-consequence during human pregnancy.

Only in doses much higher than the equivalent maximum therapeutic dose in man were effects on foetal development seen in animals. Drug-induced foetal malformations did not occur.

Medicines should not be used in pregnancy, especially the first trimester, unless the expected benefit is thought to outweigh any possible risk to the foetus.

Side-effects: As with most laxatives of this group there have been occasional reports of mild abdominal discomfort following Laxoberal administration.

Overdosage: Colicky lower abdominal pain and possible signs of dehydration may be expected particularly in the elderly and the very young.

Gastric lavage should be performed where appropriate. Adequate hydration must be maintained and the serum potassium should be measured. Antispasmodics may be

of value. Particular care about fluid balance should be taken in the elderly and young.

Pharmaceutical precautions Laxoberal should be stored at room temperature and protected from light.

Legal category P.

Package quantities 100 ml and 500 ml.

Further information Nil.

Product licence number 1416/0007.

METHRAZONE*

Presentation Orange opaque hard gelatin capsules imprinted with the company symbol on each half of the capsule. Each capsule contains feprazone 200 mg.

Uses Action: Methrazone is a non-steroidal anti-inflammatory agent of the pyrazole group, with analgesic and antipyretic activity.

Indications: The treatment of rheumatoid arthritis, osteoarthritis, ankylosing spondylitis and gout.

Dosage and administration Adults: 200–600 mg daily in divided doses by mouth after food.

Paediatric usage has not been established

Contra-indications, warnings, etc

Contra-indications: Where there is a danger of cardiac decompensation; hepatic disease including recent hepatitis; history of peptic ulceration; blood dyscrasia; drug rash or known sensitivity to pyrazoles; renal disease.

Precautions: Concurrent therapy with plasma protein-bound agents may necessitate modification of dosage.

Methrazone may potentiate the effect of some oral hypoglycaemic and sulphonamide agents and coumarin type anticoagulants. In the case of the latter, the prothrombin level should be checked regularly.

Because of rare reports of blood dyscrasias, blood count should be monitored both before and during treatment.

Patients receiving this drug should also be kept under regular surveillance for sodium and water retention and effects on the upper intestinal tract.

Although Methrazone has been in general use for several years, there is no evidence of ill-consequence during pregnancy. Animal studies have shown no hazard.

Medicines should not be used in pregnancy, especially the first trimester, unless the expected benefit is thought to outweigh any possible risk to the foetus.

Side-effects: Rashes occur in some patients, usually within 2 weeks of starting treatment; those appearing within one week are mainly urticarial, whilst those appearing in the second week tend to be morbilliform. Purpura and angioedema have occasionally been reported.

Headache, dizziness, jaundice, alimentary tract disorders (including stomatitis, diarrhoea, and bleeding) have been reported as have occasionally thrombocytopenia, granulocytopenia, tinnitus and reversible visual disturbances.

Overdosage: Up to 96 capsules have been ingested without any long-term consequences. Prothrombin time, clotting factors and platelet counts were not affected at these doses.

Symptoms include nausea, vomiting, disorientation and twitching. Treatment should include gastric lavage and general supportive measures.

Pharmaceutical precautions Store in a cool place

Legal category POM.

Package quantities Containers of 100 capsules.

Further information Nil.

Product licence number 0015/0071R

MITOXANA* ▼

Presentation White powder in vials for injectable containing ifosfamide 500 mg, 1 g or 2 g for dissolving in Water for Injections using the volume recommended for each strength.

Uses Action: Mitoxana, a cytotoxic alkylating agent does not show *in vitro* cytotoxic activity until activated by hepatic microsomal enzymes.

Indications: Following the administration of Mitoxana good response has been shown in tumours of lung, ovary, breast and testis and in soft tissue sarcoma. Responses have also been reported in tumours of uterus, kidney, pancreas, GI tract, bone, ENT and in lymphoma.

Mitoxana has been used in combination with radiotherapy, vincristine, doxorubicin, bleomycin, methotrexate, 5FU, BCNU, cytarabine, etoposide and the following regimens: doxorubicin, vincristine and prednisone; methotrexate and prednisone; 5 azacytidine and cisplatin; bleomycin and doxorubicin; bleomycin and vinblastine; vincristine and fluorouracil; doxorubicin and fluorouracil; and a modified DeVita scheme.

Dosage and administration Mitoxana should be used only by clinicians experienced in the use of cytotoxic drugs.

Dosage: The usual total dose for each course is 10 g/m² which is equally fractionated as single daily doses over 5 days. Courses are normally repeated at intervals of 2–4 weeks depending on haematological or biochemical monitoring. The white cell count should not be less than 4,000/mm³ or the platelet count less than 100,000/mm³ before the start of each course. The drug should be used only by clinicians experienced in the use of cytotoxic drugs.

The usual number of courses given is four, but maximum of seven courses has been given. Retreatment is sometimes possible following relapse.

The total course dose, the number of days over which it is fractionated and the number of courses per treatment period should be determined by the tumour type, tumour staging, the general condition of the patient and whether other chemotherapy or radiation is to be administered concurrently.

Administration: The dry contents of a vial should be dissolved in Water for Injections as follows:

500 mg vial: Add 6.5 ml of Water for Injections.

1 g vial: Add 12.5 ml of Water for Injections.

2 g vial: Add 25 ml of Water for Injections.

The resultant solution of 8% ifosfamide should not be injected directly into the vein. With the patient supine the solution may be:

1. diluted to less than a 4% solution and injected directly into the vein, or
2. infused in 5% dextrose-saline over 30–120 min or
3. injected directly into a fast running infusion.

unction have been re-
ent. Other side-effects
ea, pulmonary fibrosis,
itation.

Overdosage: The most serious consequences of over-
dosage are due to haemorrhagic cystitis and suppression
of the reticulo-endothelial system. The latter usually
recovers spontaneously, but until it does, administration
of a broad spectrum antibiotic (or possibly gammaglob-
ulin) may be advisable. Transfusions of whole-blood,
platelets or white cells are rarely necessary.

Cystitis should be treated with analgesics and the
maintenance of a high urine output by a high IV fluid
intake in conjunction with a diuretic if necessary. Haem-
orrhagic cystitis usually resolves on stopping Mitoxana.
In severe cases more intensive management may be
necessary. Intravesical instillation of 200-300 ml of a
5% formalin solution for 15 minutes followed by a
washout with 1 litre distilled water has been successful.
Care should be taken to prevent ureteric reflux. If this
fails a urological opinion should be sought with a view
to bladder tamponade, cautery or surgery. Blood trans-
fusions should also be given if clinically indicated.

No further courses of Mitoxana should be given until
the patient has fully recovered.

Cardiotoxicity has been observed with high doses of
Endoxana but as yet there have been no reports with
Mitoxana. Mitoxana should be discontinued and where
necessary, treatment with bed-rest, diuretics, oxygen
and digitalis should be considered.

Pharmaceutical precautions Store below 30°C;
protect from light. The solution should be used within
two hours of preparation.

Legal category POM.

MYDRILATE*

Presentation Isotonic, sterile, aqueous solutions of
Cyclopentolate Hydrochloride BP 0.5% and 1.0% w/v
buffered to pH5 and containing 0.01% w/v benzalko-
nium chloride.

Uses Action: A cycloplegic and mydriatic agent: it
produces paralysis of the iris sphincter and ciliary muscle
by local anticholinergic action.

Indications: The primary indication is refraction, but
Mydrilate may be used whenever mydriasis is required
for diagnosis or treatment, e.g. in corneal ulceration,
keratitis, iritis, iridocyclitis, choroiditis, especially where
atropine or homatropine cannot be used.

**Dosage and administration Refraction: Adults (16
and over):** 1 drop of 0.5% solution. Repeat in 15-20
minutes only if no apparent effect is produced.

Children (6 to 16 years): 1 drop of 1% solution. Repeat
in five minutes. Refraction can be carried out in 40-50
minutes after instillation.

Under 6 years: 1 or 2 drops of 1% solution 40-50 minutes
before refraction. It may sometimes be necessary to instil
1 drop in the evening before examination.

Mydriasis: 1 drop of 0.5% or 1% solution as required.

Treatment: 1–2 drops of 0.5% or 1% solution as required.

Cycloplegia following administration is quick in onset and short-lived. Maximal cycloplegia is achieved within 15–45 minutes of instillation, and lasts on average about 20 minutes. Recovery normally takes place in about four hours, but very occasionally some effect persists for up to 24 hours.

Mydriasis is produced very rapidly and an average pupil diameter of 7 mm is usually reached 15–30 minutes after instillation of 1 drop of 0.5% solution. Complete recovery from the mydriatic effect generally occurs spontaneously in not more than 20 hours.

Contra-indications, warnings, etc Where intra-ocular pressure is high, caution should be observed, but the effect on tension is less and does not last as long as that produced by conventional cycloplegic mydriatic drugs.

Caution should be observed when drugs of this group are administered to patients with prostatic enlargement, coronary insufficiency or cardiac failure. They are contra-indicated in patients with paralytic ileus. Systemic side-effects have rarely been reported, but have included ataxia and other atropine-like effects. Physostigmine Eye Drops BNF or any miotic agent will reverse the effect of Mydrilate.

Although Mydrilate has been in wide general use for many years, there is no evidence of ill-consequence during human pregnancy.

Medicines should not be used in pregnancy especially the first trimester, unless the expected benefit is thought to outweigh any possible risk to the foetus.

Overdosage: Symptoms of overdose include dry mouth, tachycardia, dilated pupils, ataxia, nightmares and other atropine-like effects. Treat with gastric lavage where appropriate. Neostigmine by injection may be necessary.

Pharmaceutical precautions Store in a cool place. The BPC recommends that when eye drops are dispensed for domiciliary use a caution should be given to the user to avoid contamination during use and not to use the eye drops later than one month after first opening the container. When eye drops are used in hospital wards, a separate container should be provided for each patient, and, when both eyes are being treated, a separate container for each eye. They should be discarded not later than one week after first opening the container. In out-patient and casualty departments, opened containers should be discarded at the end of each day, but each patient who has undergone out-patient surgery should be treated with a separate supply of the drops. In operating theatres, a previously unopened container should be used for each patient.

Legal category POM.

Package quantities 5 ml dropper bottles of 0.5% and 1.0% solutions.

Further information Mydrilate is non-irritant and sensitivity reactions are uncommon. The onset of cycloplegia is at least as fast as that obtained by any other preparation used for the purpose. In the normal eye it has little or no effect on intra-ocular tension.

Mydrilate 0.5% 1416/5030

Mydrilate 1.0% 1416/5031

ORGANIDIN*

Presentation Light yellow elixir containing iodinated glycerol 60 mg and alcohol (96%) 1.25 ml per 5 ml.

Uses Action: Mucosecretory stimulating agent.

Indications: For the treatment of diseases of the respiratory tract in which thick, tenacious mucus, or lack of mucous secretion, is an undesirable feature, e.g. bronchitis, asthma, laryngitis.

Dosage and administration *Adults and children over 12 years:* One 5 ml spoonful four times daily.

Children: Up to half the adult dosage.

Diluent: Organidin may be diluted with a 1:1 mixture of glycerol and water.

Contra-indications, warnings, etc In view of the association of neonatal goitre and/or hypothyroidism with maternal ingestion of iodides. Organidin therapy is not advocated during pregnancy, particularly during the last two trimesters. Long-term administration of iodide to children is also best avoided because of this goitrogenic hazard. Caution is recommended in cases of known hypersensitivity to iodides. Most patients, however, tolerate Organidin, and any adverse reactions which may occur are likely to be less severe than those resulting from inorganic iodide therapy.

Overdosage: Symptoms may be those of alcohol intoxication or excessive salivation. Elimination of the drug may be hastened by increasing the water and sodium chloride intake or by forced diuresis with mannitol.

Pharmaceutical precautions Store in a cool place, protect from light.

Legal category P.

Package quantities Bottles of 250 ml.

Further information Nil.

Product licence number 1416/5034.

PAVACOL*-D

Presentation Dark-brown cough mixture. Each 5 ml contains Papaverine Hydrochloride BP 1 mg and Pholcodine BP 5 mg, together with balsam of tolu, oil of clove, tincture of ginger, oil of aniseed, tincture of capsicum, oil of peppermint, alcohol and chloroform.

Uses Action: Papaverine is a myotropic spasmolytic which relaxes the bronchi by direct action on the smooth muscle of their walls.

Pholcodine exerts an inhibitory action on the cough centre, and has been found to be as effective as heroin as a cough suppressant. It is not a drug of addiction, and does not cause constipation.

Indications: For the symptomatic treatment of cough due to upper respiratory tract infection, influenza, bronchitis, pulmonary tuberculosis, carcinoma of the bronchus, etc, particularly in diabetic patients who require strict control of carbohydrate intake. It is a suitable for obese patients who are on a weight-reducing diet.

Dosage and administration *Adults:* One or two 5 ml spoonfuls as required.

The above dosage is adequate for most patients, but higher doses can safely be prescribed if necessary.

Children: from 6 to 12 years: One 5 ml spoonful four or five times daily.

From 3 to 5 years: One 5 ml spoonful three times daily.

From 1 to 2 years: Half a 5 ml spoonful three or four times daily.

Pavacol-D may be diluted with Sorbitol Solution BPC.

Contra-indications, warnings, etc Hypersensitivity to papaverine has been recorded. Nausea and drowsiness occur occasionally after pholcodine.

Although Pavacol-D has been in general use for many years, there is no evidence of ill-consequence during human pregnancy.

Medicines should not be used in pregnancy, especially in the first trimester, unless the expected benefit is thought to outweigh any possible risk to the foetus.

Overdosage: Overdosage may be manifest by drowsiness, nausea and should be treated by emesis or gastric lavage followed by oral hydration.

Pharmaceutical precautions Store in a cool place and protect from light.

Legal category P.

Package quantities Bottles of 100 ml and 250 ml.

Further information Previously known as Pavacol ibetic. Suitable for both diabetic and non-diabetic patients.

Product licence number 1416/5039.

NOTRANE* PESSARIES

Presentation White, bluntly conical pessaries containing hydragraphen 1.5 mg or 5 mg.

Uses Action: Anticandidal, antitrichomonal, antibacterial antiseptic.

Indications: For the treatment of vaginitis and for routine prophylaxis in gynaecological surgery.

Dosage and administration 1. Infective vaginitis. Two 1.5 mg pessaries to be inserted into the posterior fornix of the vagina each night for 15 nights, treatment being continued throughout menstruation, if appropriate. Further 15 day course should be initiated at the start of the next menstrual cycle. For severe or resistant infection or for relapse or reinfection, two 5 mg pessaries each night for 15 nights repeated at the commencement of the next menstrual cycle.

2. Prophylaxis (before vaginal surgery or cervical uterine). Two 5 mg pessaries at night for 10 nights pre-operatively and continued for 10 nights after operation.

Contra-indications, warnings, etc Known hypersensitivity to organic mercurials. Should not be used with copper IUDs, PVC ring pessaries or in the absence of vaginal secretions, e.g. in atrophic vaginitis. Penotrane pessaries should only be used during pregnancy if considered essential by the physician.

This product possesses spermicidal properties and should not be used when conception is desired.

Overdosage: There is no clinical experience of overdosage. Standard supportive measures should be adopted.

Pharmaceutical precautions Store in a cool place. Penotrane is incompatible with metals, halides and phosphides.

Legal category POM.

Package quantities Packs of 15 and 60 pessaries.

Further information In trichomoniasis concurrent treatment with a systemic trichomonocide is recommended.

Product licence numbers

Pessaries 5 mg 1416/5045

UVISTAT* CREAM

Presentation Off-white cream containing Mexenone BPC 4% w/w in an oil-in-water emulsion base.

Uses Action: Ultraviolet screen.

Indications: For the prevention of photodermatoses, acute solar dermatitis, solar urticaria and lesions or eruptions resulting from drug-induced photosensitivity and the precipitation or aggravation of ultraviolet-sensitive conditions such as lupus erythematosus, herpes labialis (simplex), rosacea, erythema multiforme and other dermatoses.

Dosage and administration The cream should be applied liberally and rubbed into all areas of the skin likely to be exposed to ultraviolet radiation, including the scalp if hair is sparse. Application twice a day may be sufficient but more frequent application is often necessary, depending on the sensitivity of the skin, the extent of exposure to ultraviolet radiation and whether sweating is profuse or the skin becomes wet.

Contra-indications, warnings, etc Although Uvistat has been in wide general use for many years, there is no evidence of ill-consequence of use during human pregnancy.

Overdosage: There is no clinical experience of overdosage. Standard supportive measures should be adopted.

Pharmaceutical precautions Nil.

Legal category GSL.

Package quantities Tubes of 50 and 100 g.

Further information Nil.

Product licence number 1416/5054.

UVISTAT-L*

Presentation Mexenone BPC 4% w/w in a base suitable for application to the lips.

Uses Action: Ultraviolet screen.

Indications: For the prevention of photodermatitis of the lips (including actinic cheilosis) and herpes labialis.

Dosage and administration Uvistat-L should be applied to the lips before they are exposed to sunlight. Maximal protection is afforded if Uvistat-L is applied frequently in a thin layer.

Further application is necessary immediately after meals, swimming or washing.

Contra-indications, warnings, etc Although Uvistat-L has been in wide general use for many years, there is no evidence of ill-consequence of use during human pregnancy.

Overdosage: There is no clinical experience of overdosage. Standard supportive measures should be adopted.

Pharmaceutical precautions Nil.

Legal category GSL.

Package quantities Single lipsticks of 5 g.

Further information Cosmetic coloured lipstick can be worn over Uvistat-L.

Product licence number 1416/5055.

WARFARIN WBP

Presentation Compressed tablets containing Warfarin Sodium BP, impressed with the letters **WBP** on one side and coloured according to strength; 1 mg—brown; 3 mg—blue, 5 mg—pink.

Uses *Action:* Oral anticoagulant.

Indications: For prophylaxis against venous thrombosis and pulmonary embolism, and for use in the treatment of these conditions to prevent their extension.

Dosage and administration Effective blood levels are rapidly reached by administering an *initial loading dose* usually of the order of 0.45–0.50 mg/kg for adults.

Maintenance dosage is started when the peak effect of the initial dosage is passed, usually after 48 hours. Its size depends on the prothrombin time or other appropriate coagulation tests. The single daily maintenance requirement is usually between 5 mg and 12 mg, but can vary between 2 mg and 30 mg.

The maintenance dose is omitted if the prothrombin time is excessively prolonged. Once the maintenance dose is stabilised in the therapeutic range it is rarely necessary to alter it.

Contra-indications, warnings, etc Animal studies have shown warfarin to be teratogenic and there have been reports of foetal death associated with its administration during human pregnancy. Warfarin should not be prescribed for pregnant women.

Warfarin should not be given to patients within three days of surgery.

The use in patients known to be hypersensitive to warfarin is contra-indicated.

When warfarin therapy is first introduced, patients should be told what to do if bleeding occurs.

Warfarin should be given with caution to patients with impaired liver or kidney function or in severe hypertension.

Warfarin should be given with caution to patients where there is a risk of serious haemorrhage such as haemorrhagic blood dyscrasias, haemophilia, ulcerative disorders, threatened abortion, subacute bacterial endocarditis, in the presence of extensive surgical wounds and after recent surgery to the eye and central nervous system.

Prothrombin times should be determined at least twice weekly for the first two weeks and subsequently longer intervals (every two to three weeks).

Overdosage may be manifest by haematuria or spontaneous bruising. This should be treated with vitamin (5–10 mg) intravenously. Significant correction occurs within four hours.

There is some evidence that abrupt conclusion or interruption of anticoagulant therapy leads to complications in the form of relapses or exacerbations of the underlying disease and it is probably wiser to 'taper' oral anticoagulants when therapy has to be concluded. Many factors *potentiate* the effect of warfarin:

1. Warfarin in the circulation is firmly bound to plasma protein and will have an increased effect if displaced by other drugs such as diuretics, oral anti-diabetic agents and anti-inflammatory agents.

2. Certain drugs, for example D-thyroxine, potentiate the effects of warfarin by increasing its affinity for the hepatic receptor site.

3. Alcohol may inhibit liver enzymes, leading to reduced dosage requirement of warfarin.

4. Other drugs which may potentiate the effect of warfarin include anabolic steroids, cimetidine, aspirin, clofibrate, sulphapyrazole, chloral hydrate, some arylglycoside antibiotics, chloramphenicol, disulfiram and paracetamol.

5. Renal damage may reduce the rate of excretion of warfarin and thus decrease the dose requirement.

6. Acute illness, weight loss and a decreased intake of vitamin K will exaggerate the response.

Other factors may *decrease* the effect of warfarin:

1. Warfarin is metabolised in the liver by microsomal enzymes. These enzymes are induced by drugs such as barbiturates and phenytoin leading to rapid metabolism of warfarin and necessitating an increased dose.

2. Oestrogens and oral contraceptives increase the concentration of vitamin K-dependent factors. Increased doses of warfarin may therefore be required.

3. Cholestyramine may absorb warfarin and thus reduce its effect.

4. Weight gain, gastro-intestinal upset and increased intake of vitamin K will necessitate an increase in maintenance dosage of warfarin.

5. Carbamazepine, glutethimide, phenazone, griseofulvin and rifampicin also diminish the effect of warfarin.

Pharmaceutical precautions Protect from heat, light and moisture.

Legal category POM.

Package quantities 1 mg, 3 mg and 5 mg tablets in containers of 100 and 500.

Further information Nil.

/eddel Pharmaceuticals Limited
/eddel House
4 West Smithfield
London EC1A 9HY

TABUSE* 200

Presentation Plain white tablets with single break. Each tablet contains 200 mg Disulfiram BP.

Uses Anti-alcoholic agent. Antabuse 200 is indicated in adjuvant in the treatment of cooperative chronic alcoholics, but its use should be supported by appropriate psychiatric treatment.

Dosage and administration On the first day of treatment, the patient should be given 4 tablets of antabuse 200 in one dose and told on no account to take any alcohol. The next day, the patient is to take 3 tablets and on the third day 2 tablets.

On the fourth and fifth days the patient should take 1 tablet and subsequently 1 tablet or possibly $\frac{1}{2}$ tablet daily, dosage continuing until, in the opinion of the physician, the patient is restored to the social order.

Dosage may be continued for up to 12 months.

On the fifth day of dosage the physician may give the patient a challenge dose of 10–15 ml of 95% alcohol to test the patient's reaction especially in terms of blood pressure and pulse rate. If the reaction is not marked a further dose of alcohol may be given, which will produce increasingly severe symptoms to make a deep impression on the patient's mind.

Do not give Antabuse 200 until at least 12 hours after last ingestion of alcohol. On no account must the patient take alcohol during treatment with Antabuse 200 as it is given as a challenge dose by the physician. The patient should be warned that many liquid medicines and wines contain sufficient alcohol to cause a reaction.

Antabuse 200 interferes with the metabolism of alcohol and causes a build-up of acetaldehyde in the blood stream. The effect of Antabuse 200 with alcohol is therefore similar to paraldehyde poisoning. Antabuse is rapidly absorbed from the gastro-intestinal tract and is very slowly eliminated.

Contra-indications, warnings, etc Antabuse 200 is contra-indicated in the presence of cardiac failure, coronary artery disease, pregnancy, psychosis and drug addiction. It should be used with caution in the presence of renal, hepatic or respiratory disease, diabetes mellitus or epilepsy.

Great care should be taken when the challenge dose of alcohol is given to patients taking Antabuse 200. The extent of the reaction is very variable. It may not appear at all on the first alcohol challenge, but it may be very severe.

Several deaths have been reported following the drinking of large volumes of alcohol by patients receiving antabuse 200.

The Antabuse/alcohol reaction is characterised by intense flushing, dyspnoea, throbbing headache, palpitations, tachycardia, nausea and vomiting. The reaction to alcohol can occur within ten minutes of taking an alcoholic drink and may persist for several hours.

Drug interactions: Antabuse 200 may potentiate the action of paraldehyde, barbiturates and other centrally acting drugs. Diazepam and chlorpromazine can reduce, and amitriptyline increase, the severity of the Antabuse/alcohol reaction.

Side effects: During initial treatment with Antabuse 200, drowsiness and fatigue are common. Nausea, vomiting, halitosis and reduction in libido can also occur. If side effects are marked the dosage should be reduced.

Rarely, psychotic reactions, including depression, paranoia, schizophrenia and mania, occur in patients on Antabuse therapy. Allergic dermatitis, peripheral neuritis and liver cell damage have been reported.

Treatment of overdose: With alcohol; Intensive supportive therapy; the main aim is to counteract hypotension and to prepare for the possibility of severe vomiting. Intravenous fluids should be administered and oxygen should be available. A pressor agent such as noradrenaline may be needed.

Without alcohol; Gastric lavage. Observation; Antabuse by itself has low toxicity.

Pharmaceutical precautions No special precautions.

Legal category POM.

Package quantities Containers of 50 tablets.

Further information Antabuse is very slowly excreted and may be detected in body fluids up to seven days after cessation of administration.

Product licence number 0495/5900.

CHENDOL*

Presentation Each orange and pearl capsule contains 125 mg of chenodeoxycholic acid.

Uses

1. **Indications:** For dissolution of radiolucent cholesterol-rich gallstones in functioning gallbladders. Cholesterol stones coated with calcium, or stones composed of bile pigments are not dissolved by chenodeoxycholic acid. It has a particular place in the treatment of patients in whom surgery is contra-indicated or who are anxious to avoid surgery.

2. **Pharmacology:** Chenodeoxycholic acid is a normal constituent of human bile. It is known as a primary bile acid since it is one of the two main bile acids synthesised by the liver. Its possible main mechanism of action is that it reduces the output of cholesterol secreted into the bile by inhibiting the enzyme HMG CoA reductase. A secondary mechanism of action is the expansion of the bile acid pool which accompanies taking exogenous chenodeoxycholic acid.

Dosage and administration The present clinical

evidence suggests that optimum results will be obtained on a dose level of 10–15 mg per kg body weight daily either as a single night time dose or in divided doses.

Duration of treatment appears to be correlated with size of stone. Generally speaking the smaller the stones, the shorter the treatment – dissolution may occur after only three months. On the other hand, larger stones may require up to two years' treatment. It is recommended that treatment continues for three months after dissolution.

Contra-indications, warnings, etc Chendol should not be administered to patients with radio-opaque calcified gallstones nor to patients with non-functioning gallbladders. In addition, Chendol should not be administered to women who may become pregnant, nor to patients with chronic liver disease, nor with inflammatory diseases of the small intestine and colon.

Chendol is generally well tolerated; the only side-effects reported to date are diarrhoea and pruritus.

It has been found that after a slight reduction in dose for a few days, diarrhoea ceases and the dose can then gradually be increased to the former level. The clinician's discretion should be applied to the necessity, in individual cases, for laboratory monitoring.

Pharmaceutical precautions Store in a well closed container.

Legal category POM.

Package quantities 100 and 500.

Further information Nil.

Product licence number 0495/0003.

HEPARIN INJECTION BP

Presentation A clear, colourless or straw-coloured pyrogen-free solution of Heparin Sodium (Mucous) in Water for Injections BP adjusted to a pH of 5 to 8. It is supplied in 5 ml multidose vials containing 1,000, 5,000 and 25,000 units heparin per ml, with 0.15% chlorocresol. In addition, single-dose ampoules containing 1,000 units per ml (5 ml) and 5,000 units in 0.2 ml are available.

Uses Heparin is an anticoagulant. It is believed to act by enhancing the effects of antithrombin III, thereby inactivating several activated clotting factors including activated factor X (Xa).

The chief use of heparin is in the treatment of arterial and venous thrombosis. It may also be used as a prophylaxis against postoperative venous thrombosis; in extra-corporeal circulation (heart-lung and dialysis machines); in blood transfusions; and in coronary thrombosis as a cover for the first 36–48 hours of oral anticoagulant therapy.

Dosage and administration *Adults:* An initial intravenous injection of 12,500 units may be given, followed by maintenance doses of about 6,000 to 12,000 units every 4 hours. The dose should, however, be adjusted to individual response, monitored by anticoagulation tests. For continuous infusion, 10,000 to 20,000 units are given in Dextrose Injection or Sodium Chloride Injection over 12 hours. In an emergency, heparin may be given subcutaneously, in doses of 10,000 to 12,500 units at 6 to 12 hour intervals. The intramuscular route of administration is not recommended.

In prophylaxis of postoperative venous thrombosis,

the usual dose is 5,000 units subcutaneously 2 hr before surgery, followed by 5,000 units every 12 hr for about 10 days after surgery.

Children: The initial dose is 50 units per kg body weight by intravenous infusion, increased to about 100 u per kg every 4 hours.

Contra-indications, warnings, etc Heparin is contra-indicated in surgery of the brain, spinal cord and because of the special hazard of post-operative haemorrhage in these patients which could cause significant disability.

The relative risks and benefits of heparin therapy should be carefully assessed in patients with a bleeding tendency (e.g. haemophilia, purpura, severe hypersensitivity or scurvy), or those patients with an actual potential bleeding site (e.g. peptic ulcer, visceral carcinoma, postoperative oozing of blood, subacute bacterial endocarditis, suspected intracranial haemorrhage, cerebral thrombosis or threatened abortion). Neither mstruation nor pregnancy is a contra-indication.

Heparin does not cross the placenta or appear in milk.

In patients with advanced renal or hepatic disease reduction in dosage may be necessary. Although hypersensitivity is rare, it is advisable to give a trial dose of 1,000 units in patients with a history of allergy.

Drugs that interfere with platelet aggregation, such as aspirin, may prolong the anticoagulant action of heparin.

The chief danger of heparin therapy is haemorrhage; but this is usually due to overdosage and is minimised by strict laboratory control. Slight haemorrhage can usually be treated by withdrawing the drug. Overdosage treated by intravenous injection of Protamine Sulphate 1 mg for every 100 units of heparin to be neutralised.

Rare side effects include acute, reversible thrombocytopenia, alopecia and osteoporosis with spontaneous fractures (after prolonged therapy).

Pharmaceutical precautions Heparin should be stored at a temperature not exceeding 25°C, when it is expected to retain its potency for at least 3 years at the date of manufacture. Heparin is incompatible aqueous solution with certain substances e.g. antibiotic hydrocortisone, phenothiazines and antihistamines.

Legal category POM.

Package quantities Vials: Packs of ten. Ampoules: Packs of fifty/ten.

HEPSAL*

Presentation A sterile, pyrogen-free, clear, colourless solution, of Heparin Sodium (Mucous) BP in Sodium Chloride Injection BP adjusted to pH 5 to 8. The solution is preservative free. Each 5 ml ampoule contains 50 u Heparin Sodium (10 units per ml).

Uses Heparin is an anticoagulant. It is believed to act by enhancing the effects of antithrombin III, thereby inactivating several activated clotting factors, including activated Factor X (Xa).

heparin is indicated in any clinical circumstances in which it is desired to maintain the patency of indwelling, intravascular catheters/cannulae, attendant lines or arterial locks.

Hypurin is not recommended for systemic use.

Dose and administration Flush with 5 mls (50 s) every 4 hours or as required.

Contra-indications, warnings, etc The very rare occurrence of established hypersensitivity to heparin is only a contra-indication to Hepsal.

As directed, it is extremely unlikely that the low levels of heparin reaching the blood will have any systemic effect.

Rigorous aseptic technique should be observed at all times in its use.

Pharmaceutical precautions Heparin may be incompatible with solutions of certain other drugs. Hepsal should be stored at a temperature not exceeding 25°C in which it can be expected to retain its potency for at least 5 years after the date of manufacture.

Legal category POM.

Package quantities Packs of 10 x 5 ml Ampoules.

Further information Nil.

Product licence number 0495/0014.

HYPURIN* ISOPHANE

Presentation A sterile suspension of a white crystalline precipitate of isophane insulin (bovine) in an isotonic aqueous medium buffered to a pH of 6.9 to 7.5. It is prepared by adding highly purified crystalline insulin of bovine origin to protamine sulphate in such an amount that the excess of insulin or of protamine in the emulsion is at a minimum. The preparation complies with the requirements of the European Pharmacopoeia for Isophane Protamine Insulin Injection. Two strengths, 40 and 80 international units per ml, are available.

Hypurin Isophane is supplied in 10 ml multidose glass ampoules. The packaging and labels are colour coded. Red and white signify Hypurin Isophane 40 international units per ml and green and white, Hypurin Isophane 80 international units per ml.

Uses Insulin is used in growth onset diabetes mellitus in maturity onset diabetes mellitus, not responding to diet or oral drugs. Its principal action is probably to accelerate the passage of glucose into the cells of certain tissues, notably skeletal muscle and adipose tissue. Hypurin Isophane may be particularly advantageous in the treatment of diabetics with insulin lipodystrophy, insulin allergy, and also in labile diabetes and when intermittent short-term therapy is required.

Dose and administration The practical aims of therapy are to reduce the blood glucose concentration to physiological levels and eliminate glycosuria and ketonuria. The dose required depends on the severity of diabetes and has to be determined empirically. Most adult patients are controlled by 20 to 120 international units per day. Children may require much less.

Isophane insulin is poorly soluble in body fluids and forms a depot from which insulin is slowly released. Its action begins after about two hours and lasts for about 24 hours. A single injection before breakfast is suitable for many patients (usually those requiring less than 40 international units per day), but others require two

injections per day or a combination of Hypurin Isophane and Hypurin Neutral.

Insulin is normally administered subcutaneously in the upper arms, thighs, buttocks or abdomen. Wherever possible, the patient should be taught to give the injection. The injection area should be varied so that the same site is never used more than about once a month. Care should be taken to see that a blood vessel has not been entered. The injection site should not be massaged.

Contra-indications, warnings, etc The vial should be shaken gently before use.

Where Hypurin Isophane is mixed with Hypurin Neutral in the same syringe, care should be taken to draw up the Hypurin Neutral into the syringe first, so as to avoid contaminating it with the longer-acting insulin.

Mixing of Hypurin Isophane with a conventional insulin should be avoided.

In no circumstances should Hypurin Isophane be given intravenously.

Insulin requirements may increase during illness, puberty, pregnancy, emotional upsets or if drugs with hyperglycaemic activity are being taken. Insulin requirements may decrease during periods of increased activity, in liver or kidney diseases or when drugs with hypoglycaemic activity are being taken.

Overdosage causes hypoglycaemia. The warning signs are vomiting (in children), palpitations, trembling, sweating, a tingling in the hands or lips, pallor, impaired vision, listlessness, confusion and dizziness. The patient should take sugar, and rest. If the patient is comatose, Strong Dextrose Injection BPC should be given intravenously.

Patients transferred to Weddel Hypurin Insulins from other commercially available preparations may require dosage adjustment.

Pharmaceutical precautions Hypurin Isophane should be stored in a refrigerator (between 2°C and 8°C) when it may be expected to retain its potency for at least two years after the date of manufacture. It should not be frozen.

Care should be taken to ensure that the syringe and needle are scrupulously cleaned before use.

Legal category P.

Package quantities Packs of 10 vials.

Further information Nil.

80 i.u./ml 0495/0018

HYPURIN* LENTE

Presentation A sterile buffered suspension of highly purified bovine insulin with zinc chloride consisting of a mixture of 3 volumes of insulin zinc suspension (amorphous) and 7 volumes of insulin zinc suspension (crystalline). The insulin is in a form insoluble in water and appears as a white suspension which on standing deposits a white sediment and leaves a colourless or almost colourless supernatant liquid. The sediment is readily re-suspended on gentle shaking. The majority of particles are crystals with a maximum dimension greater than 10 µm but rarely exceeding 40 µm; a considerable proportion have no uniform shape and do not exceed 2 µm in maximum dimension. It has a pH of 7.0 to 7.5. Two strengths are available: 40 and 80 international

units per ml. Hypurin Lente is supplied in 10 ml multi-dose glass containers. The packaging and labels are colour coded. Blue and magenta signify Hypurin Lente 40 international units per ml and green and magenta signify Hypurin Lente 80 international units per ml.

Uses Insulin is used in growth onset diabetes mellitus, and in maturity onset diabetes mellitus not responding to diet or oral drugs. Its principal action is probably to accelerate the passage of glucose into the cells of certain tissues, notably skeletal muscle and adipose tissue.

The onset of action of Hypurin Lente is gradual with a maximum lowering of blood sugar concentration 8 to 12 hours after subcutaneous injection and a total duration of action of about 30 hours.

The onset of action after the usual morning dose may be sufficiently rapid to control the rise of blood sugar concentration after breakfast, so that some diabetics needing insulin may be satisfactorily controlled by a single daily injection of the preparation.

Hypurin Lente may be particularly advantageous in the treatment of insulin-related fat atrophy, allergy, and resistance.

Dosage and administration The practical aims of insulin therapy are to reduce the blood glucose concentration to physiological levels and eliminate glucosuria and ketonuria. The dose required has to be determined empirically for each patient. The total daily insulin requirement for most adult patients lies between 20–120 international units per day.

Insulin dependent diabetes is first brought under control with Hypurin Neutral. Hypurin Lente may then be introduced as a supplement in those cases where control with a single daily injection of neutral and depot insulin seems desirable and feasible.

Some diabetics may be controlled with Hypurin Lente alone. An initial dose of 10 to 16 international units is given, and the dose gradually increased in increments of 4 units until the blood sugar concentration and glucosuria are satisfactorily controlled.

Hypurin Lente is administered by subcutaneous injection in the upper arms, thighs, buttocks or abdomen. Wherever possible, the patient should be taught to give the injection. The injection area should be varied so that the same site is never used more than about once a month. Care should be taken to see that a blood vessel has not been entered. The injection site should not be massaged.

Contra-indications, warnings, etc The vial should be shaken gently before use.

Hypurin Lente should never be given intravenously and is not suitable for the emergency treatment of diabetic coma. When, on medical advice, Hypurin Lente is administered with Hypurin Neutral, using the same syringe, care should be taken to draw up the Hypurin Neutral first into the syringe to avoid contamination of the short-acting preparation. Mixtures of Hypurin Lente with Hypurin Neutral should be used immediately after preparation and should not be stored, as there may be pharmaceutical interactions.

Various well-recognised causes of altered insulin requirement exist.

Increased insulin requirement is commonly associated with trauma, intercurrent infection, cardiac infarction and, physiologically, with puberty and the adolescent growth spurt. Early pregnancy and certain types of medication, including steroids, thyroxine and sympathomimetic agents may also increase insulin requirements.

Decreased insulin requirement is associated with increased physical activity and may occur in the later stages of pregnancy. Hypoglycaemic drugs (e.g. salicylates and sulphonamides) may lessen insulin requirements.

Overdosage causes hypoglycaemia. The warnings signs are vomiting (in children), palpitations, trembling, sweating, a tingling in the hands or lips, pallor, impaired vision, listlessness, confusion and dizziness. The patient should take sugar and rest. If the patient is comatose, Strc Dextrose Injection BPC should be given intravenously.

Patients transferred to Weddel Hypurin Insulins from other commercially available preparations may require dosage adjustment.

Pharmaceutical precautions Insulin should be stored in a refrigerator (between 2°C and 8°C) where it may be expected to retain its potency for at least 5 years after the date of manufacture. It should not be frozen.

Legal category P.

HYPURIN* NEUTRAL

Presentation A sterile, clear, colourless aqueous solution of highly purified crystalline insulin (bovine) in an isotonic medium buffered to a pH of 6.6 to 7.7. The preparation complies with the requirements of the British Pharmacopoeia for Neutral Insulin Injection. Three strengths, 40 and 80 international units per ml, are available. Hypurin Neutral is supplied in 10 ml multidose glass containers. The packages and labels are colour coded. Blue and brown signify Hypurin Neutral 40 international units per ml and green and brown signify Hypurin Neutral 80 international units per ml.

Uses Insulin is used in growth onset diabetes mellitus and in maturity onset diabetes mellitus, not responding to diet or oral drugs. Its principal action is probably to accelerate the passage of glucose into cells of certain tissues, notably skeletal muscle and adipose tissue.

Hypurin Neutral may be particularly advantageous in the treatment of diabetics with insulin lipodystrophy, insulin allergy, and also in labile diabetes and with intermittent short-term therapy is required.

Dosage and administration The practical aims of insulin therapy are to reduce the blood glucose concentration to physiological levels and eliminate glucosuria and ketonuria. The dose required depends on the severity of the diabetes and has to be determined empirically. Most adult patients are controlled by 20 to 120 international units per day. Children may require much less.

Hypurin Neutral has a rapid onset of action and may be used in the emergency treatment of diabetic coma and pre-coma. It may be used in conjunction with longer acting Hypurin insulin.

Insulin is usually administered subcutaneously in the upper arms, thighs, buttocks or abdomen. Wherever possible, the patient should be taught to give the injection. The injection area should be varied so that the same site is never used more than about once a month.

It should be taken to see that a blood vessel has not been entered. The injection site should not be massaged. Where necessary, Hypurin Neutral may be given amulsarily or, for very rapid effect, intravenously.

Contra-indications, warnings, etc Mixing of Hypurin Neutral and Hypurin Protamine Zinc Insulins in the same syringe is inadvisable because Protamine Zinc insulin contains excess protamine. This will convert a portion of the soluble insulin into long-acting insulin and in some cases, may lead to hyperglycaemia in the early stages and prolonged hypoglycaemia during the night.

Insulin requirements may increase during illness, puberty, pregnancy, emotional upsets or if drugs with hyperglycaemic activity are being taken. Insulin requirements may decrease during periods of increased activity, in liver or kidney diseases or when drugs with hypoglycaemic activity are being taken.

Overdosage causes hypoglycaemia. The warning signs are vomiting (in children), palpitations, trembling, sweating, a tingling in the hands or lips, pallor, impaired vision, weakness, confusion or dizziness. The patient should take sugar, and rest. If the patient is comatose, then Strong Dextrose Injection BPC should be given intravenously.

Patients transferred to Weddel Hypurin Insulins from other commercially available preparations may require dosage adjustment.

Pharmaceutical precautions Insulin should be stored in a refrigerator (between 2°C and 8°C) when it may be expected to retain its potency for at least two years after the date of manufacture. It should not be frozen. Care should be taken to ensure that the syringe and needle are scrupulously cleaned before use.

Legal category P.

Package quantities Packs of 10 vials.

'PURIN' PROTAMINE ZINC

Presentation A sterile suspension of protamine zinc insulin (bovine) in an isotonic aqueous medium buffered to a pH of 6.9 to 7.5. It is prepared by the addition of protamine sulphate and zinc chloride to a solution of highly purified crystalline insulin of bovine origin. The preparation complies with the requirements of the European Pharmacopoeia for Protamine Zinc Insulin Injection. Two strengths, 40 and 80 international units per ml, are available. Hypurin Protamine Zinc is supplied in 10 ml multidose glass containers. The packaging and labels are colour coded. Blue and pink signify Hypurin Protamine Zinc 40 international units per ml, and green and pink, Hypurin Protamine Zinc 80 international units per ml.

Uses Insulin is used in growth onset diabetes mellitus and in maturity onset diabetes mellitus, not responding to diet or oral drugs. Its principal action is probably to accelerate the passage of glucose into the cells of certain tissues, notably skeletal muscle and adipose tissue.

Hypurin Protamine Zinc may be particularly advantageous in the treatment of diabetics with insulin lipodys-

trophy or insulin allergy, and also in labile diabetes and when intermittent short-term therapy is required.

Dosage and administration The practical aims of therapy are to reduce the blood glucose concentration to physiological levels and eliminate glycosuria and ketonuria. The dose required depends on the severity of the diabetes and has to be determined empirically. Most adult patients are controlled by 20 to 120 international units per day. Children may require much less.

Hypurin Protamine Zinc is poorly soluble in body fluids and forms a depot from which insulin is slowly released. Its action begins after 4 to 6 hours but lasts for 24 to 36 hours. Because its action is slow in onset, it is commonly used in conjunction with Hypurin Neutral.

Insulin is normally administered subcutaneously in the upper arm, thighs, buttocks or abdomen. Wherever possible, the patient should be taught to give the injection. The injection area should be varied so that the same site is never used more than about once a month. Care should be taken to see that a blood vessel has not been entered. The injection site should not be massaged.

Contra-indications, warnings, etc The vial should be shaken gently before use.

Mixing of Hypurin Neutral and Hypurin Protamine Zinc Insulins in the same syringe is inadvisable, since protamine zinc insulin contains excess protamine. This will convert a proportion of the soluble insulin into long-acting insulin, and in some cases may lead to hyperglycaemia in the early stages, and prolonged hypoglycaemia during the night.

In no circumstances should Hypurin Protamine Zinc be given intravenously.

Insulin requirements may increase during illness, puberty, pregnancy, emotional upsets or if drugs with hyperglycaemic activity are being taken. Insulin requirements may decrease during periods of increased activity, in liver or kidney diseases or when drugs with hypoglycaemic activity are being taken.

Overdosage causes hypoglycaemia. The warning signs are vomiting (in children), palpitations, trembling, sweating, a tingling in the hands or lips, pallor, impaired vision, listlessness, confusion and dizziness. The patient should take sugar, and rest. If the patient is comatose, Strong Dextrose Injection BPC should be given intravenously.

Patients transferred to Weddel Hypurin Insulins from other commercially available preparations may require dosage adjustment.

Pharmaceutical precautions Insulin should be stored in a refrigerator (between 2°C and 8°C) when it may be expected to retain its potency for at least two years after the date of manufacture. It should not be frozen.

Care should be taken to ensure that the syringe and needle are scrupulously cleaned before use.

80 i.u./ml 0495/0013

INSULIN INJECTION PhEur, BP (SOLUBLE INSULIN BP)

Presentation A sterile, clear, colourless, isotonic,

aqueous solution of crystalline insulin (bovine), adjusted to a pH of 3.0 to 3.5. Insulin Injection is supplied in 10 ml multidose glass vials. Three strengths, 20, 40 and 80 units per ml, are available.

The packages and labels are colour coded. Yellow alone signifies Insulin Injection BP 20 units/ml, blue alone, Insulin Injection BP 40 units/ml and green alone, Insulin Injection BP 80 units/ml.

Uses Insulin is used in juvenile-onset diabetes mellitus, and in maturity-onset diabetes mellitus unresponsive to diet or oral hypoglycaemic agents.

Insulin Injection is particularly useful in diabetic coma and ketoacidosis, pregnancy, trauma and infection.

Dosage and administration The dose depends on the individual requirements of the patient and should be determined empirically.

Insulin Injection has a rapid onset of action (about 30 minutes); its effects last for 6 to 8 hours. It may be used in conjunction with a longer-acting insulin.

Insulin Injection is normally administered subcutaneously. Suitable sites are the upper arm, upper thigh, buttocks and lower abdomen. Whenever possible, the patient should be taught to give the injection. The same injection site should not be used more than about once a month. Care should be taken to ensure that a blood vessel has not been entered. The Injection site should not be massaged.

Insulin Injection may be given intramuscularly or, for very rapid effect, intravenously.

Contra-indications, warnings, etc When Insulin Injection is mixed with Isophane Insulin in the same syringe, Insulin Injection should be drawn into the syringe first, to prevent contamination with the longer-acting preparation. The mixing of Insulin Injection and Protamine Zinc Insulin Injection in the same syringe is not recommended, as the excess protamine in the latter preparation reacts with the Insulin Injection, reducing its immediate effect. Because of pharmaceutical incompatibility, Insulin Injection should not be mixed with Insulin Zinc Suspension.

Care should be taken if patients are changed from one insulin to another of a different animal source as the dosage required may differ.

Development of insulin antibodies may occasionally lead to a gradual increase in dosage requirement. Insulin requirements may also increase during illness (especially infection), pregnancy, puberty, emotional upsets, and concomitant administration of oral contraceptives, adrenaline, thiazide diuretics and other hyperglycaemic agents. Insulin requirements may decrease during periods of increased activity, liver or kidney disease, and concomitant administration of alcohol, monoamine oxidase inhibitors, propranolol, aspirin and other hypoglycaemic agents.

New patients often experience minor skin reactions, which generally cease spontaneously. Insulin may sometimes cause local lipo-atrophy.

Insulin overdosage causes hypoglycaemia. The early warning signs are weakness, giddiness, pallor, sweating, palpitations, trembling etc. Later symptoms are depression or euphoria, inability to concentrate, drowsiness, amnesia etc. In children, headache, nausea and vomiting are common. Treatment of hypoglycaemia is sugar ingestion, and rest. If untreated, hypoglycaemia leads to convulsions and coma. A comatose patient should be treated intravenously with up to 50 ml of a 50% solution of dextrose.

Pharmaceutical precautions Insulin Injecti should be stored in a refrigerator (between 2°C and 8°C) when it may be expected to retain its potency for at least two years after the date of manufacture. It should not be frozen.

Legal category P.

INSULIN ZINC SUSPENSION (MIXED) BP

Presentation A sterile buffered suspension of bovine insulin with zinc chloride consisting of a mixture of three volumes of Insulin Zinc Suspension (Amorphous) and seven volumes of Insulin Zinc Suspension (Crystalline) the insulin is in a form insoluble in water. It is an almost colourless turbid liquid in which the majority of particles are crystals with a maximum dimension greater than 10 µm but rarely exceeding 40 µm; a considerable proportion have no uniform shape and do not exceed 2 µm in maximum dimension. It has a pH of 7 to 7.5. Two strengths are available: 40 and 80 international units per ml. Insulin Zinc Suspension (Mixed) is supplied in 10 ml multidose glass containers. The packaging and labels are colour coded. Blue and purple signify Insulin Zinc Suspension, 40 i.u./ml and green and purple signify Insulin Zinc Suspension, 80 i.u./ml.

Uses Insulin is used in the treatment of diabetes mellitus not responding to diet or oral drugs. Its principal action is probably to accelerate the passage of glucose into the cells of certain tissues, notably skeletal muscle and adipose tissue.

Insulin Zinc Suspension (Mixed) gives suitable control for the average diabetic. Its onset of action is gradual with a maximum lowering of blood sugar concentration 8 to 12 hours after subcutaneous injection and a total duration of action of about 30 hours. The onset of action after the usual morning dose is sufficiently rapid to control the rise of blood sugar concentration after breakfast. Diabetics needing insulin may be satisfactorily controlled by a single daily injection of this preparation. A small proportion may need the addition of Insulin Zinc Suspension (Amorphous) or Insulin Zinc Suspension (Crystalline) for optimum control.

Dosage and administration The practical aims of therapy are to reduce the blood glucose concentration to physiological levels and eliminate glucosuria and ketonuria. The dose required depends on the severity of the diabetes and has to be determined empirically.

Severe diabetes is first brought under control with Insulin Injection and an insulin zinc suspension is then substituted in the same or slightly larger daily dose.

With uncomplicated diabetes of moderate severity, an initial dose of 10 to 16 units is given and the dose gradually increased by four units until the blood sugar concentration and glucosuria are satisfactorily controlled.

When a patient who has been receiving Protamine Zinc Insulin is changed to an insulin zinc suspension, an increase in dose of about 20% will probably be required.

When transferring from other insulin preparations to Insulin Zinc Suspension, the carbohydrate intake may have to be readjusted.

Insulin Zinc Suspension (Mixed) is administered by subcutaneous injection usually 30 to 45 minutes before breakfast in the upper arms, thighs, buttocks or abdomen. Wherever possible, the patient should be taught to give an injection. The injection area should be varied so that the same site is never used more than about once a month. Care should be taken to see that a blood vessel has not been entered. The injection site should not be massaged. Before a dose is withdrawn, the vial should be shaken gently; vigorous shaking may cause excessive foaming.

The insulin zinc suspensions are freely miscible with each other, without affecting the absorbability of the different particles. Mixtures may therefore be prepared which will control the blood sugar concentration by means of a single daily injection. They should not, however, be mixed with other insulins.

Contra-indications, warnings, etc Insulin zinc suspensions should never be given intravenously and are not suitable for the emergency treatment of diabetic coma or for insulin shock therapy.

Insulin requirements may increase during illness, puberty, pregnancy, emotional upsets or if drugs with hyperglycaemic activity are being taken. Insulin requirements may decrease during periods of increased activity, liver or kidney disease, or when drugs with hypoglycaemic activity are being taken.

Because bovine insulin is antigenic in man, insulin requirements may gradually increase over the years. Care should be taken if the patient is switched to a non-bovine insulin as the requirements may be different.

Overdose causes hypoglycaemia. The warning signs are vomiting (in children), palpitations, trembling, sweating, a tingling in the hands or lips, pallor, impaired vision, listlessness, confusion, and dizziness. Patients should be kept warm and sugar and rest.

If the patient is comatose, strong Dextrose Injection PC should be given intravenously.

Minor skin reactions are often seen in new patients. They generally cease spontaneously and do not interrupt therapy. Insulin may sometimes cause local lipoatrophy or, less commonly, fatty swellings.

Pharmaceutical precautions Insulin should be stored at a temperature between 2° and 8°C, when it can be expected to retain its potency for at least two years after the date of manufacture. It should not be frozen.

Legal category P.

Package quantities Packs of 10 vials, each containing 10 ml.

SOPHANE INSULIN INJECTION BP

Presentation A sterile suspension of a white crystalline precipitate of isophane insulin (bovine) in an isotonic aqueous medium buffered to a pH of 7.1 to 7.4. Two strengths, 40 and 80 international units/ml, are available.

Isophane Insulin Injection BP is supplied in 10 ml multidose glass containers.

The packaging and labels are colour coded. Blue and white signify Isophane Insulin Injection BP, 40 i.u./ml, and green and white, Isophane Insulin Injection BP, 80 i.u./ml.

Uses Insulin is used in growth-onset diabetes mellitus and maturity-onset diabetes mellitus not responding to diet or oral drugs. Its principal action is probably to accelerate the passage of glucose into the cells of certain tissues, notably skeletal muscle and adipose tissue.

Dosage and administration The practical aims of therapy are to reduce the blood glucose concentration to physiological levels and eliminate glycosuria and ketonuria. The dose required depends on the severity of the diabetes and has to be determined empirically. Most adult patients are controlled by 20–120 i.u./day. Children may require much less.

Isophane insulin is poorly soluble in body fluids and forms a depot from which insulin is slowly released. Its action begins after about two hours and lasts for about 18 hours. A single injection before breakfast is suitable for many patients (usually those requiring less than 40 i.u./day), but others require two injections/day or a combination of Isophane Insulin Injection BP and Insulin Injection BP.

Insulin is normally administered subcutaneously in the upper arms, thighs, buttocks or abdomen. Wherever possible, the patient should be taught to give the injection. The injection area should be varied so that the same site is never used more than about once a month. Care should be taken to see that a blood vessel has not been entered. The injection site should not be massaged.

Contra-indications, warnings, etc The vial should be shaken gently before use.

Where Isophane Insulin Injection BP is mixed with Insulin Injection BP in the same syringe, care should be taken to draw up the Insulin Injection BP into the syringe first, so avoiding contaminating it with the longer-acting insulin.

In no circumstances should Isophane Insulin Injection BP be given intravenously.

Insulin requirements may increase during illness, puberty, pregnancy, emotional upsets, or if drugs with hyperglycaemic activity are being taken. Insulin requirements may decrease during periods of increased activity, liver or kidney disease, or when drugs with hypoglycaemic activity are being taken.

Because bovine insulin is antigenic in man, insulin requirements may gradually increase over the years. Care should be taken if the patient is switched to a non-bovine insulin as the requirements may be different.

Minor skin reactions are often seen in new patients. They generally cease spontaneously and do not interrupt therapy. Insulin may sometimes cause local lipo-atrophy or, less commonly, fatty swellings.

Overdosage causes hypoglycaemia. The warning signs are vomiting (in children), palpitations, trembling, sweating, a tingling in the hands or lips, pallor, impaired vision, listlessness, confusion and dizziness. The patient should take sugar, and rest. If the patient is comatose, Strong Dextrose Injection BPC should be given intravenously.

Pharmaceutical precautions Insulin should be stored in a refrigerator (between 2° and 8°C) when it may be expected to retain its potency for at least two years after the date of manufacture. It should not be frozen.

PROTAMINE ZINC INSULIN INJECTION PhEur, BP

Presentation A sterile, white, suspension of a complex of protamine sulphate, zinc chloride and insulin (bovine), in an isotonic aqueous medium, buffered to a pH of 6.9 to 7.5. On standing, a white sediment is deposited, leaving a colourless or almost colourless supernatant. Protamine Zinc Insulin Injection is supplied in 10 ml multidose glass vials.

Two strengths, 40 and 80 units per ml, are available.

The packages and labels are colour coded. Blue and pink signifies Protamine Zinc Insulin Injection BP 40 units/ml and green and pink, Protamine Zinc Insulin Injection BP 80 units/ml.

Uses Insulin is used in juvenile-onset diabetes mellitus, and in maturity-onset diabetes mellitus unresponsive to diet or oral hypoglycaemic agents.

Dosage and administration The dose depends on the individual requirements of the patient and should be determined empirically.

Protamine Zinc Insulin Injection is poorly soluble in body fluids and forms a depot from which insulin is slowly released. Its action begins after 4 to 6 hours, and lasts for 24 to 36 hours. It may be used in conjunction with Insulin Injection BP.

Protamine Zinc Insulin Injection should only be given subcutaneously. Suitable sites are the upper arm, upper thigh, buttocks and lower abdomen. Whenever possible, the patient should be taught to give the injection. The same injection site should not be used more than about once a month. Care should be taken to ensure that a blood vessel has not been entered. The injection site should not be massaged.

Contra-indications, warnings, etc The vial should be shaken gently before use.

The mixing of Insulin Injection and Protamine Zinc Injection in the same syringe is not recommended, as the excess protamine sulphate in the latter preparation reacts with the Insulin Injection, reducing its immediate effect.

Under no circumstances should Protamine Zinc Insulin Injection be given intravenously.

Care should be taken if patients are changed from one insulin to another of a different animal source as the dosage required may differ.

Development of insulin antibodies may occasionally lead to a gradual increase in dosage requirement. Insulin requirements may also increase during illness (especially infection), pregnancy, puberty, emotional upsets, and concomitant administration of oral contraceptives, adrenaline, thiazide diuretics and other hyperglycaemic agents. Insulin requirements may decrease during periods of increased activity, liver or kidney disease, and concomitant administration of alcohol, monoamine oxidase inhibitors, propranolol, aspirin and other hypoglycaemic agents.

New patients often experience minor skin reactions, which generally cease spontaneously. Insulin may some-

times cause local lipo-atrophy. Allergic reactions to protamine sulphate content may occur infrequently.

Insulin overdosage causes hypoglycaemia. The early warning signs are weakness, giddiness, pallor, sweated palpitations, trembling etc. Later symptoms are depression or euphoria, inability to concentrate, drowsiness, amnesia etc. In children, headache, nausea and vomiting are common. Treatment of hypoglycaemia is sug ingestion, and rest. If untreated, hypoglycaemia leads to convulsions and coma. A comatose patient should be treated intravenously with up to 50 ml of a 50% solution of dextrose.

Pharmaceutical precautions Protamine Zinc Insulin Injection should be stored in a refrigerator (between 2°C and 8°C), when it may be expected to retain its potency for at least two years after the date of manufacture. It should not be frozen. It should not be used after the expiry date on the label or at any time if the precipitate appears clumped or granular after gentle shaking.

Legal category P.**Package quantities** Packs of 10 vials.**Further information** Nil.**Product licence numbers**

40 units/ml 0495/5007

80 units/ml 0495/5008

LITAREX*

Presentation Oval, white, biconvex, controlled-release tablets of diameter 16 mm and 8 mm. Each tablet contains lithium citrate 564 mg equivalent to 6 mmol lithium.

Uses Litarex is a source of lithium ions in a controlled release dosage form. Lithium may act by competing with sodium ions at various sites in the body. It changes the electrolyte composition of body fluids and increases the intracellular and total body water volume. The mechanism of action in affective disorders is not known. It is used for the treatment of acute mania and for the prophylaxis of recurrent affective disorders.

Dosage and administration Prophylactic long term treatment with Litarex should be started with a low dosage and then increased step-wise over a period of several weeks. Treatment is managed by measuring serum lithium concentration and monitoring clinical symptoms.

The initial dose is one tablet (6 mmol Li⁺) each morning and evening. Estimation of plasma-lithium concentration should be carried out after 48 hours and then at weekly intervals, and the dosage adjusted to produce a concentration of 0.80 to 1.00 mmol/litre. In some patients effective serum lithium levels may lie within the wider range 0.5 to 1.3 mmol/litre. Toxic symptoms are usually associated with serum lithium levels exceeding 1.5 mmol/litre. When the dosage is stabilised plasma-lithium estimations should be carried out weekly for one month and thereafter at monthly intervals.

Blood samples for estimation of lithium should be taken exactly 12 hours after the evening dose.

There is considerable biological variation in renal lithium clearance and thus the number of Litarex tablets required by individual patients to reach their particu-

ffective plasma concentration is variable. Tablets should be taken in two or three divided doses. Treatment of acute mania should be initiated in hospital. The required initial dose may be high, for example, 48 mmol lithium daily in four divided doses and access to immediate examination of plasma-lithium level is necessary. Lithium concentrations should not exceed 1.5 mmol/litre.

Use in elderly: Elderly patients may require smaller doses. Toxic symptoms are likely with serum concentrations above 1.0 mmol/litre.

Use in children: Not recommended.

Contra-indications, warnings, etc *Contra-indications:* Lithium is contra-indicated in patients with renal disease, cardiovascular disease or Addison's disease, and in women who are breast feeding.

Precautions: Lithium therapy should not be initiated unless adequate facilities for monitoring serum concentrations are available.

The use of lithium for long-term prophylactic treatment requires careful supervision. Serum lithium concentration should be monitored regularly and determined from a blood sample drawn 12 hours after the last dose; frequent monitoring is advisable after a change in dose; during an intercurrent illness provoking fluid loss; after starting a slimming diet; in the treatment of elderly patients; if signs of lithium toxicity or of mania or depressive relapse occur.

As bioavailability varies from product to product, a change of product should be regarded as initiation of new treatment. Blood levels should therefore be monitored weekly until reestablishment is achieved.

ECG, renal function and thyroid function should be determined prior to treatment. Patients should be euthyroid before starting treatment.

Use in pregnancy: The lithium ion crosses the placenta. It is, therefore, advisable that a pregnancy test should be carried out prior to treatment; and that women treated with lithium should adopt adequate contraceptive methods; and that treatment should be withdrawn for the first trimester of pregnancy. Treatment with lithium throughout pregnancy is associated with an incidence of congenital abnormality greater than that for the general population. Lithium dosage requirements may vary during pregnancy and after delivery; serum lithium concentrations should be monitored closely.

Lithium is excreted in breast milk, and therefore lithium treated patients should not breast feed.

Drug interactions: Lithium should be given with great care to patients taking diuretics as lithium clearance is reduced. A low sodium intake facilitates lithium reabsorption in the renal tubules and may lead to lithium accumulation.

Raised plasma levels of ADH may occur during treatment.

Symptoms of nephrogenic diabetes are particularly prevalent in patients receiving concurrent treatment with tri/tetracyclic antidepressants.

Serum lithium concentrations may increase during concomitant therapy with indomethacin or tetracycline.

Long-term treatment with lithium may result in permanent changes in the kidney and impairment of renal function. High serum concentrations of lithium, including episodes of acute lithium toxicity may enhance these changes. The minimum clinically effective dose of lithium should always be used. Patients should be maintained on lithium after 3–5 years only if, on assessment, benefit persists.

Renal function should be routinely monitored in patients with polyuria and polydipsia. Clear instructions regarding the symptoms of impending toxicity should be given by the doctor to all patients receiving long-term lithium therapy. Patients should also be warned to report if polyuria or polydipsia develop. Episodes of nausea and vomiting or other conditions leading to salt/water depletion should also be reported. Patients should be advised to maintain their usual salt and fluid intake.

Overdosage: Symptoms of severe lithium poisoning include hyper-reflexia, attacks of hyper-extension of the limbs, epileptic seizures, toxic psychosis, syncope, oliguria, circulatory failure and coma. Deaths have been reported. Gross overdosage with serum concentration of 3 mmol per litre is managed by haemodialysis or peritoneal dialysis.

Side-effects: Thirst and polyuria, fine tremor of the hands, muscular weakness, nausea and loose stools are the commonest side-effects during the first days or weeks of treatment. These often subside as treatment progresses.

During maintenance therapy fine hand tremor, weight gain, oedema, polyuria, hypothyroidism and goitre may occur.

More serious side-effects which may signal imminent lithium toxicity include loss of appetite, slurred speech, drowsiness, coarse hand tremor, vomiting, diarrhoea, fasciculation, vertigo and confusion.

Mild cognitive impairment may occur during long-term use.

Hypercalcaemia, hypermagnesaemia, hyperparathyroidism and an increase in antinuclear antibodies have also been reported.

Exacerbation of psoriasis may occur.

Pharmaceutical precautions: Tablets should be swallowed whole.

Legal category POM.

Package quantities Containers of 100.

Further information The lithium citrate in Litarex tablets is distributed in a plastic/lipid matrix from which the lithium salt is released over a period of four to five hours during passage through the gastro-intestinal tract. The tablets are formulated in such a way as to give absorption which is slow and even, so that rapid increases and high peak levels in serum lithium concentrations are avoided.

PROTAMINE SULPHATE INJECTION BP

Presentation A sterile, pyrogen-free, clear, colourless 1% solution of Protamine Sulphate (Salmine) in Sodium Chloride Intravenous Infusion BP (0.9% w/v) adjusted to a pH of 2.5 to 3.5 and supplied in 5 ml glass ampoules.

Uses Protamine is a basic protein which combines with heparin to form a stable, inactive complex. It is used to counteract the anticoagulant effect of heparin; before surgery; after renal dialysis; after open-heart surgery; if excessive bleeding occurs and when an overdose has inadvertently been given.

Dosage and administration Protamine Sulphate Injection should be administered by slow intravenous injection over a period of about 10 minutes. The dose is dependent on the amount of heparin to be neutralised.

1 mg of Protamine Sulphate will usually neutralise at least 100 international units of mucous heparin or 80 units of lung heparin. Since heparin is being continuously excreted the dose of Protamine Sulphate should be reduced if more than 15 minutes have elapsed since the heparin injection. Ideally, the dose required to neutralise the action of heparin should be calculated from the results of determinations of the amount required to produce an acceptable blood clotting time in the patient. In gross excess, protamine itself acts as an anticoagulant.

Contra-indications, warnings, etc Not more than 50 mg Protamine Sulphate (5 ml) should be given at any one time. Protamine is not suitable for reversing the effect of oral anticoagulants.

A sudden fall in blood pressure, bradycardia, dyspnoea, transitory flushing and a feeling of warmth have been observed following injection of Protamine Sulphate.

Pharmaceutical precautions Store between 15°C and 25°C.

Legal category POM.

Package quantities 5 × 10 × 5 ml ampoules.

Further information Nil.

Product licence number 0495/5000.

UNIPARIN*

Presentation A sterile pyrogen-free, clear, colourless or slightly straw coloured solution of Heparin Sodium in Water for Injections BP adjusted to a pH of 5 to 8.

It is available in pre-filled sterile unit-dose syringes containing 5,000 i.u. in 0.2 ml.

Uses Heparin is an anticoagulant and acts by inhibiting thrombin and by potentiating the naturally occurring inhibitors of activated factor X (Xa). It is used in large doses (e.g. 10,000 i.u. six-hourly intravenously) in the treatment of arterial and venous thrombosis. Low blood levels of heparin produced by subcutaneous injections (5,000 i.u. twelve-hourly) exert an anti-thrombotic effect by inactivating factor Xa.

Uniparin is used in the prophylaxis of venous thrombosis and thromboembolism in surgical patients. Uniparin may also be considered in prophylaxis of thromboembolism in other situations, medical or obstetrical, in which there is considered to be increased risk of thromboembolism.

Dosage and administration Prophylactic administration of Uniparin consists of the subcutaneous injection of 5,000 i.u. every 12 hours. In the case of prophylactic administration to surgical patients, the first dose should

be given 2 hours before operation and continued for at least 10 days post-operatively.

Uniparin should be injected into the subcutaneous tissue of the lateral abdominal wall inserting the needle vertically into a pinched-up fold of skin.

Contra-indications, warnings, etc Heparin is contra-indicated in surgery of the brain, spinal cord and eye because of the special hazard of post-operative haemorrhage in these patients which could cause significant disability.

The relative risks and benefits of heparin should be carefully assessed in patients with a bleeding tendency or those patients with an actual or potential bleeding site, e.g. hiatus hernia, peptic ulcer, neoplasm, bacterial endocarditis, retinopathy, bleeding haemorrhoids. Neither menstruation nor pregnancy is a contra-indication. Heparin does not cross the placenta or appear in the milk.

In most patients the recommended low-dose regime produces no alteration in clotting time. However, patients show an individual response to heparin and it is therefore essential that the effect of therapy on coagulation time should be monitored in patients undergoing major surgery. Drugs that interfere with platelet aggregation e.g. aspirin, dextran solutions, should be used with care.

Although the Uniparin syringe is specifically designed to minimise the risk of overdosage, bleeding can occur and, under these circumstances, clotting time and platelet count should be determined. Prolonged clotting time will indicate the presence of an anticoagulant effect requiring neutralisation by protamine sulphate, and the dose should be calculated by titration of the individual patient's requirements.

Thrombocytopenia has been observed occasionally. There is some evidence that prolonged dosing with heparin (i.e. for many months) may cause alopecia or osteoporosis. Hyper-sensitivity reactions occur but are extremely rare.

Pharmaceutical precautions Uniparin should be stored at a temperature not exceeding 25°C when it can be expected to maintain its potency for at least three years after date of manufacture. Store protected from light.

Legal category POM.

Package quantities Packs of 50 pre-filled sterile disposable syringes.

Wellcome

ACTIDIL* TABLETS AND ELIXIR

Presentation Each tablet contains 2.5 mg Triprolidine Hydrochloride BP. Scored and coded Wellcome L2A. White in colour.

Each 5 ml of orange-coloured elixir contains 2 mg Triprolidine Hydrochloride BP and has a flavour of mandarin orange.

Uses Antihistamine.

Symptomatic relief of allergic conditions.

Actidil elixir is particularly suitable for use in children.

Dosage and administration *Adults:* 1–2 tablets or 5–10 ml elixir three times a day. In severe cases of allergy it may be advisable to give 2 or 3 tablets initially followed by 1 or 2 tablets every four hours.

Children: Over 12 years: As for adults.

6–12 years: 7.5 ml three times a day.

1–6 years: 5 ml three times a day.

Under 1 year: 2.5 ml three times a day.

Actidil Elixir may be diluted with Syrup BP.

Contra-indications, warnings, etc

Contra-indications: Contra-indicated in patients with known hypersensitivity to triprolidine.

Precautions: May cause drowsiness. Patients should not drive a vehicle or operate machinery until they have determined their own response. In some patients the drowsiness induced by antihistamines may be potentiated by alcohol or other central sedatives.

In severe hepatic or renal dysfunction a single dose of Actidil should be given initially and the response to it used as a guide to the patient's requirement for further administration of the product.

Side- and adverse effects: Triprolidine may cause drowsiness. Lichenoid skin eruptions due to triprolidine have rarely been reported

Use in pregnancy and lactation: No data are available on the use of Actidil in human pregnancy nor on the excretion of it or its metabolites in human milk.

Toxicity and treatment of overdosage: Drowsiness, dizziness, inco-ordination, weakness, convulsions and respiratory depression may occur.

Necessary measures should be taken to maintain and support respiration. Gastric lavage should be performed if indicated and convulsions controlled with diazepam. There are theoretical grounds for believing that the elimination of triprolidine and its metabolites could be accelerated by dialysis.

Pharmaceutical precautions *Tablets and elixir:* Store below 25°C. Protect from light.

Legal category P.

Package quantities Bottle of 100 tablets. Bottle of 500 ml elixir.

Further information Nil.

Tablets 0003/5001

Elixir 0003/5002

ACTIFED* COMPOUND LINCTUS

Presentation Each 5 ml of bright red-coloured syrup contains 1.25 mg Triprolidine Hydrochloride BP, 30 mg Pseudoephedrine Hydrochloride BP and 10 mg Codeine Phosphate BP, and has a mixed fruit flavour.

Uses Relief of cough and cough accompanied by nasal congestion and congestion of mucous membranes of the upper respiratory tract.

Dosage and administration

Adults: 10 ml three times a day.

Children: Over 12 years: 10 ml three times a day.

6–12 years: 7.5 ml three times a day.

1–6 years: 5 ml three times a day.

May be diluted with Syrup BP.

Pharmacology: Pseudoephedrine has direct and indirect sympathomimetic activity and is an orally effective upper respiratory tract decongestant. Pseudoephedrine is substantially less potent than ephedrine in producing both tachycardia and elevation in systolic blood pressure and considerably less potent in causing stimulation of the central nervous system. Codeine provides analgesic and antitussive activity whilst triprolidine provides antihistamine activity by antagonising H₁ receptors.

Contra-indications, warnings, etc

Contra-indications: Contra-indicated in patients with known hypersensitivity to any of the constituents.

Contra-indicated in persons under treatment with monoamine oxidase inhibitors and within two weeks of stopping such treatment.

Precautions: Although pseudoephedrine causes virtually no pressor effect in patients with normal blood pressure, Actifed Compound Linctus should be used with caution in patients with cardiovascular disorders, including hypertension. The effect of antihypertensive agents which modify sympathetic activity may be partially reversed by Actifed Compound Linctus.

Caution should also be exercised in patients taking other sympathomimetic agents, such as decongestants, appetite suppressants and amphetamine-like psychostimulants. The effects of a single dose on the blood pressure of these patients should be observed before recommending repeated or unsupervised treatment.

As with other sympathomimetic agents, caution should be exercised in patients with prostatic enlargement or bladder dysfunction.

In severe hepatic or renal dysfunction a single dose of Actifed Compound Linctus should be given initially and the response to it used as a guide to the patient's requirement for further administration of the product.

The antibacterial agent furazolidone is known to cause a progressive inhibition of monoamine oxidase and although there are no reports of hypertensive crises having occurred, it should not be administered concurrently with Actifed Compound Linctus.

May cause drowsiness. Patients should not drive a vehicle or operate machinery until they have determined their own response. In some patients the drowsiness induced by antihistamines may be potentiated by alcohol or other central sedatives.

Side- and adverse effects: In some patients, pseudoephedrine may occasionally cause insomnia. Triprolidine may cause drowsiness. Fixed drug eruption due to pseudoephedrine taking the form of nummular patches and lichenoid skin eruption due to triprolidine have been reported but these are rare events.

Use in pregnancy and lactation: No data are available on the use of Actifed Compound Linctus during pregnancy nor on the excretion of it or its metabolites in human milk.

Toxicity and treatment of overdose: Probable symptoms include drowsiness, inco-ordination, weakness, palpitation, irritability, hypertension, convulsions and difficulty in micturition. In severe cases there may be respiratory depression due to the codeine component. Gastric lavage and supportive measures for respiration and circulation should be performed if indicated. Convulsions should be controlled with an anticonvulsant. Catheterisation of the bladder may be necessary. Alpha-adrenergic blockade may be required to treat hypertensive crises and beta-adrenergic blockade for the control of supra-ventricular dysrhythmias. Pseudoephedrine has a renal excretion half-life of approximately seven hours and if desired the elimination can be accelerated by acid diuresis or by dialysis.

Pharmaceutical precautions Store below 25°C. Protect from light.

Legal category P.

Package quantities Bottles of 100 ml and 2 litres.

Further information Nil.

Product licence number 0003/5005.

ACTIFED* EXPECTORANT

Presentation Each 5 ml of clear orange syrup contains 1.25 mg Triprolidine Hydrochloride BP, 30 mg Pseudoephedrine Hydrochloride BP and 100 mg Guaiphenesin BP.

Uses Conditions where an expectorant and upper respiratory tract decongestant are required.

Dosage and administration

Adults and children over 12 years: 10 ml three times a day

Children 6–12 years: 5 ml three times a day

Children 1–6 years: 2.5 ml three times a day

Actifed Expectorant may be diluted with Syrup BP.

Pharmacology: Pseudoephedrine has direct and indirect sympathomimetic activity and is an orally effective upper respiratory tract decongestant. Pseudoephedrine is substantially less potent than ephedrine in producing both tachycardia and elevation in systolic blood pressure and considerably less potent in causing stimulation of the central nervous system. On the basis of widespread and

long established clinical use, guaiphenesin is recognised as an expectorant in bronchitis. Triprolidine provides antihistamine activity by antagonising H₁ receptors.

Contra-indications, warnings, etc

Contra-indications: Contra-indicated in patients with known hypersensitivity to pseudoephedrine, triprolidine or guaiphenesin. Contra-indicated in persons under treatment with monoamine oxidase inhibitors and within 2 weeks of stopping such treatment.

Precautions: Although pseudoephedrine causes virtually no pressor effect in patients with normal blood pressure, Actifed Expectorant should be used with caution in patients with cardiovascular disorders, including hypertension. The effect of anti-hypertensive agents that modify sympathetic activity may be partially reversed by Actifed Expectorant.

Also caution should be exercised in patients taking other sympathomimetic agents, such as decongestants, appetite suppressants and amphetamine-like psycho stimulants. The effects of a single dose on the blood pressure of these patients should be observed before recommending repeated or unsupervised treatment.

As with other sympathomimetic agents caution should be exercised in patients with prostatic enlargement or bladder dysfunction.

In severe hepatic or renal dysfunction a single dose of Actifed Expectorant should be given and the patient's response used as a guide to the dosage requirement for further administration.

The antibacterial agent furazolidone is known to cause a progressive inhibition of monoamine oxidase and although there are no reports of a hypertensive crisis having occurred, it should not be administered concurrently with Actifed Expectorant.

May cause drowsiness. Patients should not drive a vehicle or operate machinery until they have determined their own response. In some patients the drowsiness induced by antihistamines may be potentiated by alcohol or other central sedatives.

Side- and adverse effects: In some patients, pseudoephedrine may occasionally cause insomnia. Triprolidine may cause drowsiness. Fixed drug eruption due to pseudoephedrine taking the form of nummular patches and lichenoid skin eruption due to triprolidine have been reported but these are rare events.

Use in pregnancy and lactation: No data are available on the use of Actifed Expectorant in human pregnancy, or on the excretion of it or its metabolites in human milk.

Toxicity and treatment of overdose: Probable symptoms may comprise drowsiness, inco-ordination, weakness, palpitations, irritability, hypertension, convulsions and difficulty in micturition. Gastric lavage and supportive measures for respiration and circulation should be performed if indicated. Convulsions should be controlled with an anticonvulsant. Catheterisation of the bladder may be necessary. Alpha-adrenergic blockade may be required to treat hypertensive crisis and beta-adrenergic blockade for the control of supraventricular dysrhythmias.

Pseudoephedrine has a renal excretion half-life of approximately 7 hours and if desired the elimination can be accelerated by acid diuresis or by dialysis.

Pharmaceutical precautions Store below 25°C. Do not refrigerate. Protect from light.

Legal category P.

Package quantities Bottles of 100 ml. Bottles of litre.

ACTIFED* TABLETS AND SYRUP

Presentation Each tablet contains 2.5 mg Triprolidine hydrochloride BP and 60 mg Pseudoephedrine Hydrochloride BP. Scored and coded Wellcome M2A. White colour.

Each 5 ml of clear, golden-yellow syrup contains .25 mg Triprolidine Hydrochloride BP and 30 mg Pseudoephedrine Hydrochloride BP, and has a pleasant flavour.

Uses Decongestant and antihistamine.

For decongestion of the upper respiratory tract including the sinuses, antra and Eustachian tubes in the common cold, hay fever, allergic and vasomotor rhinitis and aerotitis (otitis barotrauma).

Dosage and administration *Adults:* 1 tablet or 10 ml three times a day.

Children: Over 12 years: As for adults.

6-12 years: 7.5 ml three times a day.

1-6 years: 5 ml three times a day.

3-12 months: 2.5 ml three times a day.

Actifed Syrup may be diluted with Syrup BP.

Pharmacology: Pseudoephedrine has direct and indirect sympathomimetic activity and is an orally effective upper respiratory tract decongestant. Pseudoephedrine is substantially less potent than ephedrine in producing both bradycardia and elevation in systolic blood pressure and considerably less potent in causing stimulation of the central nervous system. Triprolidine provides antihistamine activity by antagonising H₁ receptors.

ALCOPAR* DISPERSIBLE GRANULES

Presentation 5 g of the dispersible yellow-green granules contain the equivalent of 2.5 g bephenium (base) as Bephenium Hydroxynaphthoate BP.

Uses For the treatment of hookworm infestation by *Ancylostoma duodenale* (but not *Necator americanus*). Also concurrent ascariasis (roundworm infection) and trichostrongyliasis.

Dosage and administration The required dose of Alcopar should be mixed in water or in a flavoured drink and swallowed immediately.

Adults: The contents of 1 sachet.

Children: Over 2 years: The contents of 1 sachet.

Under 2 years or under 10 kg body weight: Half the contents of 1 sachet.

In the presence of heavy infestations it is recommended that treatment be repeated after three days.

No purgation or dietary restriction is necessary.

Contra-indications, warnings, etc

Contra-indications: Alcopar should not be given to patients with persistent vomiting.

Side- and adverse effects: No serious side-effects have been reported. Nausea, vomiting, abdominal discomfort and diarrhoea have occasionally been observed.

Use in pregnancy and lactation: Alcopar can be administered during pregnancy, and to the lactating mother.

Toxicity and treatment of overdosage: No data available. When administered orally, only a small fraction is absorbed from the gastro-intestinal tract. Thus symptoms are likely to be similar to those listed under side- and adverse effects. Gastric lavage followed by symptomatic and general supportive therapy is recommended.

Pharmaceutical precautions Nil.

Legal category P.

Package quantities Box of 25 × 5 g sachets.

Further information Nil.

Product licence number 0003/5007.

ALKERAN* TABLETS AND INJECTION

Presentation *Alkeran Tablets:* 2 mg Melphalan BP coloured pink with a white core and coded Wellcome A2A.

5 mg Melphalan BP coloured pink with a white core and coded Wellcome B2A.

Alkeran Injection: Each vial contains the equivalent of 100 mg sterile anhydrous Melphalan BP. 1 ml ampoule of Wellcome Acid-Alcohol Solvent and 9 ml ampoule of Wellcome Diluent are included in the unit pack.

Uses Cytotoxic agent. Alkylating agent.

Alkeran tablets are indicated in the treatment of multiple myeloma and advanced ovarian adenocarcinoma. Alkeran has a significant therapeutic effect in a proportion of patients suffering from advanced breast cancer and polycythaemia vera. Alkeran has been used as an adjuvant to surgery in the management of breast carcinoma.

Alkeran injection is indicated in the treatment of localised malignant melanoma of the extremities and localised soft tissue sarcoma of the extremities, when treated by regional perfusion.

Dosage and administration

Adults: The absorption of Alkeran after oral administration is variable and in some patients it is poorly absorbed. Dosage may need to be cautiously increased until myelosuppression is seen, in order to ensure that potentially therapeutic levels have been reached.

Multiple myeloma: The administration of Alkeran and prednisone is more effective than Alkeran alone. The combination is usually given on an intermittent basis, although the superiority of this technique over continuous therapy is not established. A typical dosage schedule is 0.15 mg/kg bodyweight/day in divided doses for 4 days together with 40 mg prednisone daily for 4 days, repeated at intervals of six weeks. Numerous regimes have been used and the literature should be consulted for details. Prolonging treatment beyond one year in responders does not appear to improve results.

Ovarian adenocarcinoma: The usual regime is 0.2 mg/kg bodyweight/day, given orally in divided doses, three times daily, for 5 days. This is repeated every 4–8 weeks,

provided the bone marrow has recovered. Similar results have been reported following a single intravenous infusion of 1 mg/kg bodyweight over 8 hours every weeks.

Advanced carcinoma of the breast: Alkeran may be given orally at a dose of 0.2–0.3 mg/kg bodyweight daily 6 mg/m² body surface area daily for 4–6 days at repeated every 3–6 weeks.

Malignant melanoma: Regional perfusion with Alkeran has been used as an adjuvant to surgery for early malignant melanoma and as palliative treatment for advanced but localised disease. The literature should be consulted for details of perfusion technique and dosage.

Soft tissue sarcoma: Regional perfusion with Alkeran has been used in the management of all stages of localised soft tissue sarcoma, usually in combination with surgery. Alkeran has frequently been given with actinomycin D and the literature should be consulted for details of dose regimes.

Polycythaemia vera: For remission induction the usual dose is 6–10 mg daily for 7–10 days, the maintenance dose is 2–4 mg daily. During maintenance careful haematological control is essential with dosage adjustment according to the results of frequent blood counts.

Children: Alkeran is very rarely indicated in children and dosage guidelines cannot be stated.

Administration of injection: Alkeran is unstable in infusion fluids. It should not be given in dextrose solutions. Infusions may be given with saline but, at room temperature, the same solution should not be used for more than 8 hours. Alternatively, Alkeran may be injected into the tubing of a fast running infusion.

When using Alkeran Injection precautions should be taken to avoid contact with it. The wearing of protective gloves is essential and eye protection is advised.

Preparation of Alkeran Melphalan Injection: 1 ml Wellcome Acid-Alcohol Solvent should be added to the vial containing 100 mg anhydrous melphalan. The vial should be shaken at once and the melphalan will dissolve immediately. When it has dissolved, 9 ml Wellcome Diluent should be added to give a resulting solution with a pH of about seven which will remain clear for some time. The solution should be prepared as required and injected within 15 to 30 minutes.

Contra-indications, warnings, etc

Contra-indications: In view of the seriousness of the indications there are no absolute contra-indications.

Precautions: Alkeran is an active cytotoxic agent for use only under the direction of physicians experienced in the administration of such agents.

Careful attention should be paid to the monitoring of blood counts to avoid the possibility of excessive myelosuppression and the risk of irreversible bone marrow aplasia.

The main side-effect of Alkeran treatment is bone marrow depression, leading to leucopenia and thrombocytopenia. Blood counts may continue to fall after treatment is stopped, so at the first sign of an abnormally large fall in leukocyte or platelet counts treatment should be temporarily interrupted.

Alkeran should not be given to patients who have recently received radiotherapy or other cytotoxic agents.

In patients with moderate to severe renal impairment the initial dose of the intravenous preparation should be reduced by 50%. Subsequent dosage should be determined according to haematological response. Currently

ailable pharmacokinetic data does not justify an solute recommendation on dosage reduction when ministering the oral preparation to these patients, but may be prudent to use a reduced dose initially.

Patients with renal impairment should be closely served as they may have uraemic marrow suppression. mporary significant elevation of the blood urea has en seen in the early stages of Alkeran therapy in reloma patients with renal damage.

Alkeran is mutagenic in animals and chromosome errations have been observed in patients being treated th the drug.

The evidence is growing that Alkeran in common with her alkylating agents may be leukaemogenic in man. ere have been reports of acute leukaemia occurring ter prolonged Alkeran treatment for diseases such as nyloid, malignant melanoma, macroglobulinaemia, ld agglutinin syndrome and ovarian cancer.

A comparison of patients with ovarian cancer who ceived alkylating agents with those who did not owed that the use of alkylating agents, including keran, significantly increased the incidence of acute ukaemia. The leukaemogenic risk must be balanced jainst the potential therapeutic benefit when consid- ing the use of Alkeran.

Alkeran causes suppression of ovarian function in emenopausal women resulting in amenorrhoea in a nificant number of patients.

Side- and adverse effects: The most common side-effect bone marrow depression.

Gastro-intestinal effects such as nausea and vomiting cur in up to 30 per cent of patients receiving Alkeran. iarrhoea and stomatitis may occasionally occur. Gastro- testinal disturbance is usually mild and occurs less equently than with combination cytotoxic therapy.

Alopecia has been reported but is uncommon. Macu- papular rashes and pruritus have occasionally been oted. There have also been case reports of pulmonary rosis and haemolytic anaemia occurring after mel- halan treatment.

A life-threatening immediate allergic reaction has been ported after intravenous administration.

Use in pregnancy and lactation: Although there are no ata available the possibility that melphalan may be ratogenic should be borne in mind because of its imilarity to other alkylating agents which are potentially ratogenic.

The use of Alkeran should be avoided whenever ossible during pregnancy, particularly during the first imester. In any individual case the potential hazard to e foetus must be balanced against the expected benefit o the mother.

Mothers receiving Alkeran should not breastfeed.

Toxicity and treatment of overdose: The principal toxic ffect is on the bone marrow and as there is no known ntidote the blood picture should be closely monitored or two weeks.

General supportive measures, together with appropri- te blood transfusion, should be instituted if necessary.

Pharmaceutical precautions *Alkeran Tablets:* Store elow 25°C in a dry place.

Alkeran Injection: Store below 25°C. Protect from light.

Legal category POM.

Package quantities *Tablets 2 mg:* Bottle of 25.

Tablets 5 mg: Bottle of 25.

Unit Pack: 1 vial containing the equivalent of Melphalan BP 100 mg; 1 ampoule of 1 ml Wellcome Acid-Alcohol Solvent for Alkeran; 1 ampoule of 9 ml Wellcome Diluent for Alkeran.

Further information Alkeran has the general phar- macological properties of nitrogen mustard compounds. It is well absorbed by the oral route, both in animals and in man.

Injection 0003/5010

ALMEVAX* RUBELLA VACCINE, LIVE BP

Presentation A live attenuated Wistar RA 27/3 rubella virus strain, propagated in human diploid cells, and freeze-dried.

0.5 ml of the reconstituted vaccine contains not less than 1,000 TCID₅₀ (tissue culture infective dose, 50).

This vaccine contains not more than 2 i.u. neomycin sulphate and 5 i.u. polymyxin B sulphate per 0.5 ml reconstituted vaccine.

Uses For active immunisation against rubella. Vaccination may be carried out at any age; preferably, however, it should be postponed beyond the first year of life since, below one year, the presence of maternal antibodies may impair the immune response. It should be noted that a past history of clinical rubella is an unreliable guide to immune status.

As with any other live attenuated virus vaccine, vaccination does not always result in seroconversion of 100% of susceptible subjects.

Dosage and administration *Adults:* 0.5 ml of the reconstituted vaccine.

Children: As for adults.

A single dose constitutes a full immunising course.

0.5 ml of the reconstituted vaccine is injected subcu- taneously. If the injection site is swabbed, only acetone, ether or isopropyl alcohol should be used and allowed to dry before the injection is made.

Method of use: For reconstitution, use only the special sterile diluent. Almevax diluent has been tested to ensure that it does not inhibit the live attenuated virus.

Use only sterile disposable syringes and needles which are free from traces of disinfectants or spirits. Use a fresh syringe and needle for each injection.

To ensure satisfactory reconstitution add the diluent slowly. The reconstituted vaccine should be colourless to light pink. See *Pharmaceutical Precautions* for handling of reconstituted vaccine.

Do not attempt to obtain more than the stated number of doses from the vial.

Reconstitution: *Pack size – volume of special sterile diluent required for reconstitution of vaccine.*

One-dose: The contents of the diluent container.

Ten-dose: The contents of the diluent container.

Contra-indications, warnings, etc

Contra-indications: Pregnant women must not be vac- cinated. Vaccination should not be carried out within four weeks of other live vaccines or within six weeks following administration of human immune serum glob- ulin, whole blood or plasma.

The vaccine should not be given to persons suffering from febrile conditions, intercurrent infections, malignant

disease, severe chronic disease, gamma-globulin deficiency or to those with impaired immune responsiveness, whether idiopathic or as a result of treatment with steroids, radiotherapy, cytotoxic drugs or other agents. Vaccination of subjects with thrombocytopenia should be avoided. The vaccine should not be administered to a subject who has experienced a serious reaction (e.g. anaphylaxis) to a previous dose of this vaccine or who is known to be hypersensitive to any component thereof. The vaccine contains a small amount of neomycin and polymyxin and should not be given to individuals known to be sensitive to either of them.

Precautions: Attenuated rubella virus vaccine may temporarily depress tests for cell-mediated immunity.

Rubella virus has been implicated as a possible aetiological factor in juvenile rheumatoid arthritis and, on that basis, it is suggested that children with rheumatoid arthritis should not be routinely immunised with rubella virus vaccine. Although anaphylaxis is rare, facilities for its management should always be available during vaccination.

Side- and adverse effects: Side-effects are uncommon, but mild symptoms may occur about the ninth day after vaccination. Symptoms relate to those seen following natural infection, but in the majority of cases are slight and transient. They include lymphadenopathy, rash, malaise, sore throat, mild fever, headache and occasionally temporary arthralgia, infrequently associated with signs of inflammation. Marked joint symptoms are more often seen in adult females than in children or adolescents. Nevertheless, even in adults, joint symptoms do not usually interfere with normal activities. Local pain and, rarely, erythema at the site of injection may occur.

Falls in platelet counts, unassociated with symptoms, have been described after vaccination. Neurological symptoms have been reported following vaccination. However, a cause and effect relationship has not been established.

Use in pregnancy and lactation: There is a possibility that live attenuated virus administered during pregnancy could infect and damage the foetus, producing congenital abnormalities. Therefore, *pregnant women must not be vaccinated* and pregnancy should be excluded before vaccination is undertaken. This danger to the developing foetus equally applies in the case of a pregnancy conceived within three months following vaccination. Women of childbearing age must be warned that, for at least three months after vaccination, they must take strict contraceptive precautions. If there is any possibility that they may become pregnant within this period, they should not be vaccinated.

Toxicity and treatment of overdose: Not applicable.

Pharmaceutical precautions Store at 2–8°C. Use special Almevax diluent for reconstitution. After reconstitution the vaccine should be kept cool (2–20°C), protected from light, and used within one hour.

Legal category POM.

Package quantities Ampoule of 1 dose, with container of special diluent.

Rubber-capped vial of 10 doses, with container of special diluent.

Further information Rubella vaccination policy differs from country to country. In the UK the vaccine is offered routinely to all girls between their 11th and 14th

birthdays and to susceptible adult females of childbearing age, including post-partum women.

Product licence number 0003/5123.

ANTEPAR* TABLETS AND ELIXIR

Presentation Each tablet contains Piperazine Phosphate BP equivalent to 500 mg Piperazine Hydrate B coloured yellow and scored, with the word Antep embossed on the reverse side.

The elixir is a pineapple-flavoured clear, orange coloured syrup containing a stable combination Piperazine Hydrate BP and Piperazine Citrate BP equivalent to 750 mg Piperazine Hydrate BP in each 5 ml.

Uses For the treatment of enterobiasis (pinworm threadworm infection) and ascariasis (roundworm infection).

Antepar Elixir is especially suitable for administration to infants and children.

Dosage and administration The tablets should be chewed.

Enterobiasis: The dose should be calculated according to age or weight and given once daily for seven days.

Age (years)	Approx. weight	Elixir	Tablets
Adults	Over 55 kg	15 ml	4
Children:			
Over 12	Over 40 kg	15 ml	4
5–12	17–40 kg	10 ml	3
2–4	13–16 kg	5 ml	1½
Under 2	Under 13 kg	50–75 mg piperazine hydrate/kg bodyweight	

It may be necessary to repeat the course after a week interval.

No special dietary regimen is needed.

Attention to general cleanliness is essential in order to prevent reinfection.

Owing to the facility with which pinworm infection is transmitted, it is advisable to examine all other members of a household once one is known to be infected. Treatment of all positive cases should be carried out simultaneously.

Ascariasis: A single dose taken preferably in the morning will usually produce complete clearance of worms from the gut.

Age (years)	Approx. weight	Elixir	Tablets
Adults	Over 55 kg	30 ml	8
Children:			
Over 10	Over 34 kg	30 ml	8
6–10	21–33 kg	20 ml	6
5–6	17–20 kg	15 ml	4½
2–4	13–16 kg	10 ml	3
Under 2	Under 13 kg	120 mg piperazine hydrate/kg bodyweight	

Contra-indications, warnings, etc

Contra-indications: Patients with a history of piperazine hypersensitivity or patients with renal failure.

Precautions: Caution should be exercised in treating

ients with renal or significant hepatic impairment, or tonic disorders of the central nervous system.

Recipitation of grand mal attacks in patients with a own history of epilepsy has been reported.

Care should be taken in administration of piperazine to ients receiving phenothiazines as it has been suggested that piperazine potentiates the extrapyramidal acts of chlorpromazine in man and animals.

fe- and adverse effects: These are uncommon when tepar is given at the recommended dosage but the lowing reactions have been reported:

Gastro-intestinal: nausea, vomiting, colic and irrhoea.

Central nervous system: transient headache and ziness. More severe reactions, including ataxia, muscle hypotonia, clonic contractions, drowsiness and paired consciousness, seldom occur at the recommended dosage in individuals without a previous history neurological abnormalities or renal disease.

Hypersensitivity reactions: urticaria, bullous eruptions, edema, arthralgia, fever and tachycardia.

Case reports of purpura, a viral hepatitis-like disorder d acute haemolysis in a glucose-6-phosphate dehydrogenase deficient individual after piperazine administration, appear in the medical literature.

se in pregnancy and lactation: The safety of Antepar use during pregnancy has not been established but etal toxicity studies in animals and extensive clinical perience have not revealed evidence that its use is sociated with a risk to the foetus. Unless symptoms arant immediate treatment it is advisable to postpone ministration of Antepar until after parturition. No ormation is available on the excretion of piperazine or metabolites in breast milk.

toxicity and treatment of overdosage: Symptoms of erdosage are likely to be similar in character to the fe-effects listed above. These may be expected to solve spontaneously. Gastric lavage should be carried t only if Antepar has been recently ingested. Adequate ids and routine supportive measures should be given, cluding the administration of anti-convulsants when cessary.

armaceutical precautions *Tablets:* Store below 10°C. Keep dry. Protect from light.

Elixir: Antepar Elixir may be diluted with Syrup BP. Store low 25°C. Protect from light.

gal category P.

ckage quantities *Tablets:* Strip pack of 28.

Elixir: Bottles of 100 ml, 500 ml.

urther information Nil.

Elixir 0003/5015

Tablets 0003/5016

RILVAX* YELLOW FEVER VACCINE, VE BP

**(7D strain live freeze-dried)
(el/Vac)**

resentation A specially stabilised freeze-dried preparation of the living attenuated 7D strain of yellow fever virus which is avirulent for man. The strain of virus used in this preparation is free of avian leucosis viruses and is opagated in leucosis-free chick embryos. The vaccine ifls the requirements of the World Health Organisation.

Each 0.5 ml dose of reconstituted vaccine contains the equivalent of not less than 1,000 mouse LD₅₀ units as defined by the World Health Organisation requirements, and not more than 2 i.u. of neomycin sulphate and 5 i.u. of polymyxin B sulphate.

The diluent consists of sterile water which has been specially tested to ensure that it does not inhibit the vaccine virus.

Uses For active immunisation of residents in yellow fever endemic areas and travellers to and from such areas, for the issue of an International Certificate of Vaccination, as required by the national health authorities of certain countries which consider these zones as infected areas (although the 'yellow-fever endemic zones' are in fact no longer included in the International Health Regulations). Yellow fever endemic areas are limited to the African and South American continents and Central America. The International Health Regulations define the form of certificate of vaccination to be used which, in the case of primary vaccination, is valid for a period of 10 years from the 10th day after vaccination. In the case of revaccination within 10 years, the certificate is valid at once.

Dosage and administration *Adults and children over age of 9 months:* The dose shall be the same for persons of all ages, 0.5 ml of reconstituted vaccine, given subcutaneously.

For reconstitution use only the special sterile diluent supplied.

Arilvax diluent has been tested to ensure that it does not inhibit the vaccine virus. Using a sterile syringe and needle inject the contents of the appropriate Arilvax diluent container into the vaccine vial and gently agitate to ensure reconstitution. The vaccine vial is sealed under vacuum to enhance stability and some users may prefer to break this vacuum to facilitate withdrawal of the vaccine solution. Any frothing will then subside.

See *Pharmaceutical precautions* for handling of reconstituted vaccine.

Use a fresh sterile disposable syringe and needle free from traces of spirit and disinfectants for each injection.

Do not attempt to obtain more than the stated number of doses from the vial.

Contra-indications, warnings, etc

Contra-indications: The vaccine should not be administered to a subject who has experienced a serious reaction (e.g. anaphylaxis) to a previous dose of this vaccine or who is known to be hypersensitive to any component thereof. It is advisable to avoid vaccination during an acute infection. Since the vaccine is prepared in chick embryos and contains small quantities of neomycin and polymyxin, it should not be administered to individuals who are hypersensitive to egg or chick protein or to these antibiotics.

The vaccine should not be given to those with impaired immune responsiveness, whether idiopathic or as a result of treatment with steroids, radiotherapy, cytotoxic drugs or other agents.

Precautions: The vaccine is not recommended for use in children under the age of 9 months. The decision to vaccinate infants under this age must depend on the anticipated risk of exposure to the disease, since the small number of cases of encephalitis that have been reported have nearly all occurred in infants under this age.

It is advisable to avoid administration of the vaccine within 6 weeks following the administration of immune

globulin on general principles. Similarly, on theoretical grounds it is advisable to avoid the administration of immune globulin within 2–3 weeks following vaccination. Although anaphylaxis is rare, facilities for its management should always be available during vaccination.

Side- and adverse effects: Reactions to the vaccine are extremely rare. Occasionally some redness and swelling may occur at the site of injection, and headache has been reported.

Use in pregnancy and lactation: On theoretical grounds the vaccine should not be administered during pregnancy.

Toxicity and treatment of overdosage: Not applicable.

Pharmaceutical precautions The freeze-dried vaccine should be stored at temperatures below 8°C and protected from light. Diluent should not be frozen but should be stored upright in a cool place (below 15°C).

After reconstitution the vaccine should be kept cool, protected from light and used within one hour.

Legal category POM.

Package quantities Freeze-dried vaccine in packs of 10 × 1-dose vials with separate diluent; 10 × 5-dose vials with separate diluent; 10 × 10-dose vials with separate diluent.

Further information It is recommended that when both yellow fever and smallpox vaccines need to be given, there should be an interval of at least three weeks between the two procedures.

If this is not feasible, the two vaccines may be given at the same time, but at separate sites. This is preferable to shortening the interval between the two procedures because of the possibility of interference between the two vaccines.

Product licence number 0003/0100.

BANOCIDE* TABLETS

Presentation Each tablet contains 50 mg Diethylcarbamazine Citrate BP. Each tablet is scored, coded 'Wellcome S2A' and is white in colour.

Uses For the treatment of filarial infections due to: *Wuchereria bancrofti*, *Brugia malayi*, *Onchocerca volvulus*, *Loa loa*.

For the prophylaxis of bancroftian and malayan filariasis and loiasis.

Dosage and administration **Adults: Treatment:** 6 mg/kg body weight daily in 3 divided doses for three weeks. In order to reduce the incidence and severity of allergic manifestations (see below), an initial dose of 1 mg/kg body weight, gradually increased over three days, is recommended.

Prophylaxis: Bancroftian and malayan filariasis – 50 mg monthly.

Loiasis – 4 mg/kg for three successive days each month.

Children: As for adults.

Contra-indications, warnings, etc

Contra-indications: None.

Precautions: Onchocerciasis patients receiving diethylcarbamazine should be carefully monitored for eye changes.

Side- and adverse effects: Allergic reactions, arising from the destruction of microfilariae, are common and may be severe – particularly during treatment of onchocerciasis and malayan filariasis. They take the form of generalised pruritus and conjunctival congestion and may be modified by the concurrent administration of antihistamines or corticosteroids.

Eye changes, including reduction in visual field, acuity, optic atrophy and optic disc leakage have been observed during administration of diethylcarbamazine for the treatment of onchocerciasis. The frequency, duration of the changes and the roles of the parasite and drug in their aetiology are, at present, unknown. Investigations have not shown eye changes during treatment of other filarial infections.

Use in pregnancy and lactation: In view of the severe reactions that may follow diethylcarbamazine administration, it is advisable to postpone treatment of pregnant women until after parturition. No information is available on the excretion of diethylcarbamazine in breast milk.

Toxicity and treatment of overdosage: Symptoms likely to be those of nausea, vomiting, headache, dizziness and drowsiness. In severe cases convulsions and coma may occur. Treatment by gastric lavage and supportive measures should be adequate. Anti-convulsants may be required in cases of convulsions and coma.

Pharmaceutical precautions Store below 25°C. Keep dry.

Legal category P.

Package quantities Bottle of 100 tablets.

Further information Nil.

Product licence number 0003/5018.

BRETYLATE* INJECTION

Presentation Each 2 ml ampoule contains 100 mg bretylium tosylate.

Uses Bretylate Injection may be of value in the treatment of patients with ventricular dysrhythmias resistant to conventional treatment. Its use should be limited to intensive care units in hospitals, where facilities for monitoring and treating patients with serious cardiac dysrhythmias are available. There is a delay of 20 minutes to 2 hours in the development of antidysrhythmic activity following administration. For this reason, quick-acting local anaesthetics remain the treatment of choice for patients with serious ventricular dysrhythmias. If they continue to recur despite conventional treatment, Bretylate Injection may be of value in restoring sinus rhythm.

Dosage and administration **Adults:** An initial dose of Bretylate Injection of 0.1 ml/kg body weight (equivalent to 5 mg bretylium tosylate/kg body weight) may be given by intramuscular injection, taking care to avoid important nerves. Further intramuscular injections of Bretylate may be given at intervals of six or eight hours. Individual doses should not exceed 0.1 ml/kg body weight.

Intravenous injection from a syringe should not be used because: (1) bolus injections may cause nausea and vomiting; (2) there is no evidence that antidysrhythmic activity is hastened by this mode of administration. Slow intravenous infusion (10 mg bretylium tosylate/kg body weight in 24 hours) does not cause nausea.

vomiting, but the clinical efficacy of this mode of administration is not known.

Idren: Not applicable.

Contra-indications, warnings, etc

Contra-indications: There is no evidence that prophylactic administration of Bretlylate Injection confers clinical benefit in patients with recent but uncomplicated myocardial infarction. Not to be used in the primary treatment of cardiac dysrhythmias.

Precautions: Bretlylate Injection, in the dose recommended, will cause adrenergic neurone blockade which may result in a fall of blood pressure. Patients should therefore remain recumbent throughout treatment. Tissue perfusion usually remains satisfactory despite falls of blood pressure. If, however, a fall in blood pressure raises concern, treatment should be stopped or subsequent doses reduced. If perfusion of a vital organ falls critically, it is recommended that blood volume be increased with the usual precautions.

Noradrenaline or sympathomimetic amines should not be administered.

Side- and adverse effects: Nausea with or without vomiting may occasionally follow intramuscular administration of Bretlylate Injection in the recommended dose. If this occurs, treatment should be stopped or subsequent doses reduced.

Use in pregnancy and lactation: No data are available on the use of Bretlylate in human pregnancy nor on the excretion of it or its metabolites in human milk.

Toxicity and treatment of overdose: The symptoms of acute overdose are likely to be marked hypotension and syncope.

Treatment is by means of general supportive measures such as intravenous infusion of plasma. Slow intravenous injection of noradrenaline or phenylephrine may be given under expert supervision.

Pharmaceutical precautions Store below 25°C. Do not freeze. Protect from light.

Legal category POM.

Package quantities Box of 5 ampoules.

Further information Nil.

Product licence number 0003/0038.

HOLERA VACCINE BP WELLCOME® (Chol/Vac)

Description Cholera vaccine contains heat-killed, phenol-preserved *Vibrio cholerae*, serotypes Inaba and Ogawa, at a concentration of not less than 8,000 million per ml.

Uses Immunisation against cholera including cholera Tor. Although this vaccine does not contain the El Tor serotypes of the classical Inaba and Ogawa serotypes, carefully controlled field studies have shown that the classical biotype equally protects against both classical and El Tor.

Dosage and administration Primary vaccination consists of two doses of vaccine given subcutaneously, intramuscularly, preferably separated by a period of over a month. This interval may be reduced even to seven days, though the response may be poorer, when rapid immunisation is necessary.

Age	First dose	All subsequent doses
1-5 years	0.1 ml	0.3 ml
5-10 years	0.3 ml	0.5 ml
Over 10 years	0.5 ml	1.0 ml

The container should on all occasions be well shaken before withdrawing material for injection.

Immunity is short-lived so that booster doses are required every six months under conditions of continued exposure. A single booster dose will suffice even if considerably longer than six months has elapsed since the last dose was administered.

For second and subsequent doses, particularly if there has been some reaction to a previous dose, it may be preferable to give the vaccine intradermally, in a volume of 0.1 ml where the subcutaneous dose is 0.5 ml or less, and 0.2 ml in other cases. However, it is possible that some countries may be unwilling to accept travellers who have not received the larger subcutaneous doses.

Travellers to or from certain countries which have reported cholera infection may be required to produce written evidence of cholera vaccination during the previous six months. A single dose normally meets these requirements and the International Certificate becomes valid six days after the first dose of vaccine was administered, but some countries may demand two doses. The certificate becomes valid immediately after a booster dose within six months of primary immunisation.

Contra-indications, warnings, etc

Contra-indications: The vaccine should not be administered to a subject who has experienced a serious reaction (e.g. anaphylaxis) to a previous dose of this vaccine or who is known to be hypersensitive to any component thereof. It is advisable to avoid vaccination during an acute infection.

Precautions: Repeated vaccination may result in the development of hypersensitivity to protein constituents of the vaccine. Although anaphylaxis is rare, facilities for its management should always be available during vaccination.

Cholera vaccine is not recommended for administration to infants under the age of one year as reactions are more frequent in this age group.

Intradermal administration of the first dose of a primary course is not recommended.

Side- and adverse effects: Local reactions consisting of pain, redness and swelling may develop within hours of vaccination resulting in discomfort at the site of injection for one or two days. They may be accompanied by fever, malaise and headache. Persons who have received numerous doses of cholera vaccine are particularly susceptible to such reactions even if many years have elapsed since the last vaccination was carried out. Occasionally delayed reactions occur. Serious reactions are uncommon but may include collapse, and rarely neurological symptoms such as neuritis, polyneuritis and various other manifestations of cerebral and meningeal involvement.

Use in pregnancy and lactation: This vaccine has been in wide use for many years without apparent ill consequence. However, as with any agent which may produce a systemic reaction, vaccination is, if possible, to be avoided in pregnancy.

Toxicity and treatment of overdose: Not applicable.

Pharmaceutical precautions Store at 2-8°C. Protect

from light. *Do not freeze.* When multidose containers are employed it is good practice to discard any partly used vaccine vials at the end of the vaccinating session.

This preparation on standing has a tendency to settle out in a gelatinous form. This is the nature of the organism in the vaccine and vigorous shaking as a rule will yield a homogenous suspension for injection. The container should on all occasions be well shaken before withdrawing material for injection.

Legal category POM.

Package quantities Vials of 1.5 ml and 10 ml.

Further information Nil.

Product licence number 0003/5126.

DARAPRIM* TABLETS

Presentation Each tablet contains 25 mg of Pyrimethamine BP. Scored and coded A3A and white in colour.

Uses Daraprim acts as a causal prophylactic and suppressive agent against malaria caused by *Plasmodium falciparum*. It also acts as a suppressant against *Plasmodium vivax* infections. In areas of known or suspected resistance to pyrimethamine or related compounds, another prophylactic should be used.

Dosage and administration *Adults:* 1 tablet regularly each week.

Children: Over 10 years: 1 tablet regularly each week.

5–10 years: $\frac{1}{2}$ tablet regularly each week.

Under 5 years: Formulation not applicable.

Daraprim is rapidly absorbed and therefore prophylactic cover can be expected shortly after the first dose. Prophylaxis should commence before arrival in an endemic area and be continued once weekly. On returning to a non-malarious area dosage should be maintained for a further four weeks.

Contra-indications, warnings, etc

Contra-indications: Daraprim should not be given to patients with a history of pyrimethamine sensitivity.

Precautions: The recommended dosage should not be exceeded.

Daraprim should be used with caution in patients with hepatic or renal disorders.

During pregnancy and in other conditions predisposing to folate deficiency, a folate supplement should be given.

Daraprim, by its mode of action, may further depress folate metabolism in patients receiving treatment with other folate inhibitors. Occasional reports suggest that individuals taking pyrimethamine as malarial prophylaxis at doses in excess of 25 mg weekly may develop megaloblastic anaemia if co-trimoxazole is prescribed concurrently.

The concurrent administration of lorazepam and Daraprim may induce hepatotoxicity.

Side- and adverse effects: At the recommended dose, side-effects are rare. Occasionally, rashes have been observed. Excessive doses may produce a macrocytic anaemia resembling that of folic acid deficiency.

Use in pregnancy and lactation: While there is a theoretical risk of foetal abnormality with all folate inhibitors given during pregnancy, no such adverse effects have been reported with Daraprim. A folate supplement should be given to pregnant women receiv-

ing Daraprim. The amount of pyrimethamine excreted in breast milk is insufficient to contra-indicate its use in lactating mothers.

Toxicity and treatment of overdosage: Symptoms reported have included vomiting, cyanosis, respiratory distress, convulsions and tachycardia. In less severe cases gastric lavage, adequate fluids and general supportive measures are recommended. In severe cases maintenance of a clear airway and control of convulsions are required, in addition. Fresh blood transfusions counteract blood dyscrasias should be available.

To counteract possible folate deficiency, calcium folinate 9 to 15 mg daily should be given until the signs of toxicity have subsided.

Pharmaceutical precautions Store below 25°C. Protect from light.

Legal category P.

Package quantities Strip pack of 30 tablets.

Further information When taken as directed Daraprim is an effective antimalarial, but it may be rendered ineffective by the development of drug resistance from time to time in certain regions. Local medical advice about the suitability of the product should, therefore, be obtained immediately on arrival in a malarious region.

Product licence number 0003/5026.

DIPHTHERIA VACCINE TAF, BP 1968 WELLCOME* (Dip/Vac/TAF)

Presentation This preparation is a suspension of the floccules that are formed when toxoid prepared from the toxin of *Corynebacterium diphtheriae* and its antitoxin obtained from horse serum are mixed. The amount of antitoxin in the mixture is equivalent to about 80% of the toxoid produced. Each dose of Toxoid-Antitoxin Floccules contains not less than 100 Lf of the original toxoid.

Phenol is added at a concentration of 0.5% as a preservative.

Uses For active immunisation against diphtheria.

Diphtheria vaccine TAF is used for inducing or reinforcing immunity to diphtheria in persons over the age of 10 years and who are known to be Schick positive.

Dosage and administration *Adults:* For primary immunisation it is necessary to give three intramuscular or deep subcutaneous injections of 0.5 ml at intervals of not less than four weeks. For reinforcement of immunity a single 0.5 ml dose is sufficient.

Children: Over 10 years: As above.

Diphtheria Vaccine TAF is not as potent an immunising agent against diphtheria as the adsorbed vaccine and therefore its use is reserved for individuals for whom the other preparations are unsuitable. Primary immunisation against diphtheria in children up to the age of 10 years is usually carried out by the administration of the more potent Diphtheria, Tetanus, Pertussis vaccine (DTPe/Vac, DTPe/Vac/Ads). Diphtheria and Tetanus vaccines (DT/Vac, DT/Vac/Ads) or adsorbed diphtheria vaccine (Dip/Vac/Ads) as appropriate.

The vial should be well shaken before withdrawing each dose.

Record the title, dose and lot number of all vaccine and date administered. Report any untoward reactions

Intra-indications, warnings, etc

Contra-indications: Contra-indicated in persons allergic to horse serum. The vaccine should not be administered to a subject who has experienced a serious reaction (e.g. anaphylaxis) to a previous dose of this vaccine or who is known to be hypersensitive to any component thereof. It is advisable to avoid vaccination during an acute infection.

Precautions: This vaccine contains antitoxin derived from horse serum and may, therefore, cause sensitisation. Although anaphylaxis is rare, facilities for its management should always be available during vaccination.

Side- and adverse effects: Reactions occur infrequently. They include swelling, redness or tenderness that may develop locally and usually subsides without treatment. Headache, malaise and pyrexia may occasionally occur.

Use in pregnancy and lactation: Accurate information is not available on the safety of the vaccine in pregnancy.

Toxicity and treatment of overdosage: Not applicable.

Pharmaceutical precautions Store at 2–8°C. Protect from light.

Do not freeze.

When multi-dose containers are employed, it is good practice to discard any partly used vaccine vials at the end of the vaccinating session.

Legal category POM.

Package quantities Vial of 5 ml.

Further information Nil.

Product licence number 0003/5129.

ADSORBED DIPHTHERIA VACCINE BP, WELLCOME* (Dip/Vac/Ads)

Presentation Adsorbed Diphtheria Vaccine is a suspension of highly purified toxoid prepared from the exotoxin of *Corynebacterium diphtheriae* adsorbed onto hydrated aluminium phosphate. The aluminium content does not exceed 1.25 mg/dose. Thiomersal BP is added as a preservative to a concentration of 0.01%.

Each 0.5 ml dose has an immunising potency of not less than 30 International Units (IU).

The immunising potency of this vaccine is now expressed in International Units in accordance with the requirements of the European and British Pharmacopoeias. These units measure the immunising activity of the vaccine whereas the previously used Lf units expressed the quantity of toxoid present. There is no simple numerical relationship between IU and Lf. No change has been made to the potency although it is now expressed in IU.

Uses For active immunisation against diphtheria.

Primary immunisation against diphtheria in infancy is usually carried out by the administration of combined adsorbed diphtheria and tetanus (DT/Vac/Ads) or Trivax* (DTPe/Vac) or Trivax-Ad* (DTPe/Vac/Ads). Primary immunisation against diphtheria alone for children under the age of 10 years may be carried out with adsorbed diphtheria vaccine. It may also be used in healthy positive adults and children over the age of 10 years who are at particular risk.

Dosage and administration The primary course of immunisation is two doses given by intramuscular or

deep subcutaneous injection separated by an interval of at least four weeks.

Adults and children over 10 years of age: Two doses of 0.2 ml.

Children under 10 years of age: Two doses of 0.5 ml.

A reinforcing dose of 0.5 ml should be administered at about five years of age to children immunised in infancy.

Oral Poliomyelitis Vaccine BP may be given at the same time as Diphtheria Vaccine.

Shake well before each dose is withdrawn. Record the title, dose and lot number of all vaccines and the date administered. Report any untoward reactions.

Contra-indications, warnings, etc

Contra-indications: Adsorbed diphtheria vaccine should not be administered intradermally. The vaccine should not be administered to a subject who has experienced a serious reaction (e.g. anaphylaxis) to a previous dose of this vaccine or who is known to be hypersensitive to any component thereof. It is advisable to avoid vaccination during an acute infection.

Precautions: Adsorbed Diphtheria Vaccine should not be administered to children over the age of 10 years or to adults without a preliminary Schick test, to avoid giving vaccine to persons who are already immune or to those who are hypersensitive, i.e. those who show a negative-or-pseudo-Schick reaction.

Although anaphylaxis is rare, facilities for its management should always be available during vaccination.

Side- and adverse effects: Local reactions consisting of swelling, redness and tenderness at the injection site may occur and occasionally may be severe. They may be more frequent and severe after the second than the first injection. Local reactions are uncommon in children under two years of age.

General reactions consisting of transient fever, malaise and headache may occur.

Allergic reactions, urticaria, pallor and dyspnoea have been reported following injection of adsorbed diphtheria vaccine.

A small painless nodule may form at the injection site but usually disappears without sequelae. However, persistent nodules at the injection site may occasionally follow the administration of this vaccine especially if the inoculation is introduced into the superficial layers of subcutaneous tissue.

Use in pregnancy and lactation: Accurate information is not available on the safety of the vaccine in pregnancy.

Toxicity and treatment of overdosage: Not applicable.

Pharmaceutical precautions Store at 2–8°C. Protect from light.

Do not freeze.

Legal category POM.

Package quantities Box of 5 × 0.5 ml ampoules.

Further information Nil.

Product licence number 0003/5128.

DIPHTHERIA AND TETANUS VACCINE BP, WELLCOME* (DT/Vac/FT)

Presentation Diphtheria and tetanus vaccine is a mixture of purified diphtheria and tetanus toxoids which are prepared by formalin detoxification of *Corynebacterium diphtheriae* and *Clostridium tetani* exotoxins.

Thiomersal BP is added as a preservative to a concentration of 0.01%. Each 0.5 ml dose contains 25 Lf diphtheria toxoid and 3.5 Lf tetanus toxoid.

The antigenic content and formulation of this vaccine has not been changed, although the labelled content of the tetanus component has been altered to conform with the flocculation equivalence of the new British reference antitoxin preparation.

Uses For reinforcement of immunity at five years or over in children who were immunised in infancy with either adsorbed diphtheria-tetanus vaccine (DT/Vac/Ads) or with Trivax* (DTPer/Vac) or Trivax-Ad* (DTPer/Vac/Ads) and who do not require continued immunisation against whooping cough.

The more potent antigen, Adsorbed Diphtheria and Tetanus Vaccine is preferred for primary immunisation against diphtheria and tetanus, but either preparation of combined diphtheria-tetanus vaccine may be used for reinforcement of immunity.

Simultaneous reinforcement of immunity to diphtheria and tetanus in adults and children over 10 years of age is rarely needed. Diphtheria-containing vaccines should not be given unless a Schick test has been carried out to avoid giving the vaccine to persons who are already immune or to those who are hypersensitive, i.e. those who show a negative-or-pseudo-Schick reaction.

Dosage and administration The vaccine is given by intramuscular or deep subcutaneous injection.

Children under 10 years: 0.5 ml.

Adults and children over 10 years: 0.2 ml.

In subjects who suffered a reaction to a previous dose of adsorbed vaccine it may be preferable to administer 0.1 ml of Diphtheria and Tetanus vaccine in Simple Solution intradermally. Oral Poliomyelitis Vaccine BP may be given at the same time as Diphtheria Tetanus Vaccine.

Shake well before withdrawing a dose. Record the title, dose and lot numbers of all vaccines and date administered. Report any untoward reactions.

Contra-indications, warnings, etc

Contra-indications: The vaccine should not be administered to a subject who has experienced a serious reaction (e.g. anaphylaxis) to a previous dose of this vaccine or who is known to be hypersensitive to any component thereof. It is advisable to avoid vaccination during an acute infection.

Precautions: Although anaphylaxis is rare, facilities for its management should always be available during vaccination.

Side- and adverse effects: Local reactions, swelling, redness and tenderness at the injection site, and general reactions, transient fever, malaise and headache may be caused by either or both component toxoids. Acute allergic reactions – anaphylaxis, urticaria, angioneurotic oedema, pallor and dyspnoea, serum sickness and peripheral neuropathy have been reported following administration of diphtheria or tetanus vaccines.

Transverse myelitis has been reported after simultaneous administration of diphtheria and tetanus vaccine and oral polio vaccine, but a cause and effect relationship has not been established.

Use in pregnancy and lactation: Since simultaneous vaccination against diphtheria and tetanus in adults is uncommon, there is no accurate information on the safety of this vaccine in pregnancy.

Toxicity and treatment of overdose: Not applicable.

Pharmaceutical precautions Store at 2–8°C. Protect from light.

Do not freeze.

When multi-dose containers are employed it is good practice to discard any partly used vaccine vials at the end of the vaccinating session.

Legal category POM.

Package quantities Vial of 5 ml.

Further information Nil.

Product licence number 0003/5130.

ADSORBED DIPHTHERIA AND TETANUS VACCINE BP, WELLCOME* (DT/Vac/Ads)

Presentation Adsorbed diphtheria and tetanus vaccine is a mixture of highly purified diphtheria and tetanus toxoids which are prepared by formalin detoxification of *Corynebacterium diphtheriae* and *Clostridium tetani* exotoxins. The toxoids are adsorbed onto aluminium hydroxide. The aluminium content does not exceed 1.25 mg/dose. Thiomersal BP is added as a preservative to a concentration of 0.01%. Each 0.5 ml dose contains not less than 30 i.u. diphtheria toxoid and 40 i.u. tetanus toxoid.

The immunising potency of this vaccine is not expressed in International Units in accordance with the requirements of the European and British Pharmacopoeias. These units measure the immunising activity of the vaccine whereas the previously used Lf unit expressed the quantity of toxoid present. There is no simple numerical relationship between IU and Lf. No change has been made to the potency although it is not expressed in IU.

Uses For active immunisation against diphtheria and tetanus.

Adsorbed diphtheria and tetanus vaccine is used principally for the primary immunisation of infants and children under ten years of age against tetanus and diphtheria where the use of pertussis-containing vaccines (DTPer/Vac, DTPer/Vac/Ads) is contra-indicated or not required. It is also given to reinforce immunity in children under 10 years of age immunised in infancy with diphtheria and tetanus vaccine. Trivax* or Trivax Ad* (DT/Vac/Ads, DTPer/Vac, DTPer/Vac/Ads).

Simultaneous primary immunisation or reinforcement of immunity to diphtheria and tetanus in adults and children over 10 years of age is rarely needed. Diphtheria containing vaccines should not be given to these subjects unless a Schick test has been carried out to avoid immunising persons who are already immune and/or hypersensitive, i.e., those who show a negative and/or-pseudo-Schick reaction.

Dosage and administration For primary immunisation two intramuscular or deep subcutaneous injections separated by an interval of at least four weeks are recommended.

Children under 10 years: Two doses of 0.5 ml.

Adults and children over 10 years: Two doses of 0.2 ml

A single dose of adsorbed tetanus vaccine should be administered 6 to 12 months after the second dose of the combined diphtheria and tetanus vaccine to complete the primary course of immunisation against tetanus.

A reinforcing dose of 0.5 ml of adsorbed or simple diphtheria and tetanus vaccines should be administered at about five years of age to children immunised in

nfancy with diphtheria and tetanus vaccine or combined diphtheria, tetanus and pertussis vaccine.

It may be preferable to administer 0.1 ml of Diphtheria and Tetanus vaccine in simple solution intradermally to adults and children who have suffered a reaction to a previous dose of adsorbed vaccine.

Poliomyelitis vaccine (oral) may be given at the same time as diphtheria and tetanus vaccine.

Shake thoroughly before withdrawing each dose. Record the title, dose and lot numbers of all vaccines and the date administered. Report any untoward reactions.

Contra-indications, warnings, etc

Contra-indications: Adsorbed Diphtheria and Tetanus vaccine should not be administered intradermally.

The vaccine should not be administered to a subject who has experienced a serious reaction (e.g. anaphylaxis) to a previous dose of this vaccine or who is known to be hypersensitive to any component thereof. It is advisable to avoid vaccination during an acute infection.

Precautions: Although anaphylaxis is rare, facilities for its management should always be available during vaccination.

Side- and adverse effects: Local reactions, swelling, redness and tenderness at the injection site, and general reactions, transient fever, malaise and headache may be caused by either or both component toxoids. Acute allergic reactions – anaphylaxis, urticaria, angioneurotic oedema, pallor and dyspnoea, serum sickness and peripheral neuropathy have been reported following administration of diphtheria or tetanus vaccines.

Persistent nodules at the injection site may occasionally follow administration of adsorbed vaccine, especially if the inoculation is into the superficial layers of subcutaneous tissue.

Transverse myelitis has been reported after simultaneous administration of diphtheria and tetanus vaccine and oral polio vaccine, but a cause and effect relationship has not been established.

Use in pregnancy and lactation: Since simultaneous vaccination against diphtheria and tetanus in adults is uncommon there is no accurate information on the safety of this vaccine in pregnancy.

Toxicity and treatment of overdosage: Not applicable.

Pharmaceutical precautions Store at 2–8°C. Protect from light.

Do not freeze.

It is good practice to discard any partly used vaccine vials at the end of the vaccinating session.

Legal category POM.

Package quantities Box of 5 × 0.5 ml ampoules. Vial of 5 ml.

Further information Nil.

Product licence number 0003/5131.

HUMOTET* ANTITETANUS IMMUNOGLOBULIN INJECTION BP

Presentation Purified immunoglobulin obtained from the sera of healthy human donors known to have high levels of tetanus antitoxin following active immunisation with tetanus vaccine.

Humotet is a clear, colourless, semi-viscous liquid containing thiomersal 0.01% as a preservative, and glycine 2.25%. Each vial contains 250 i.u. of tetanus antitoxin in 1.0 ml solution.

Uses For passive immunisation against tetanus, in conjunction with adsorbed tetanus vaccine as soon as practicable after a tetanus-susceptible person has sustained a wound. Also for the treatment of tetanus.

Dosage and administration *Prevention of tetanus following injury: Adults:* Humotet should be administered by intramuscular injection usually in a dose of 250 i.u. – see table on next page.

Persons not immunised, or inadequately immunised, with tetanus vaccine are susceptible to tetanus and all wounds are prone to tetanus infection. In cases of doubt a person should be regarded as inadequately immunised.

Administration of immunoglobulin does not obviate the need for debridement and wound cleansing, nor does it contra-indicate the use of antibiotics.

The prophylactic immunisation schedule against tetanus (see table) should be carried out as soon as possible after a person has sustained a wound. Passive immunisation with immunoglobulin should be accompanied by simultaneous active immunisation with adsorbed tetanus vaccine.

If more than 24 hours have elapsed since the wound was sustained or if there is a risk of heavy contamination with *Clostridium tetani* 2 ml (500 i.u.). Humotet should be given, irrespective of immunisation history.

Humotet and adsorbed tetanus vaccine should be administered with separate syringes and into separate sites. Tetanus vaccine in simple solution is unsuitable for administration concurrently with Humotet.

A single dose of Humotet usually provides a protective level of tetanus antitoxin, over 0.01 i.u. per ml serum, for

<i>Patient's history</i>	<i>Immediate action</i>		<i>Follow-up action</i>
<i>Previous record of receiving tetanus vaccine</i>	<i>Administer Humotet</i>	<i>Administer adsorbed tetanus vaccine</i>	<i>Administer tetanus vaccine (adsorbed or in simple solution)</i>
None or Not known	1.0 ml (250 i.u.)	0.5 ml	0.5 ml after 6–12 weeks and 6–12 months
One dose (during last 6 weeks)	1.0 ml (250 i.u.)	0.5 ml to be given 4–6 weeks after first dose of vaccine	0.5 ml 6–12 months after second dose
One dose (more than 6 weeks ago)	1.0 ml (250 i.u.)	0.5 ml	0.5 ml 6–12 months after second dose
Two doses	Nil	0.5 ml to be given if more than 6 weeks after second dose of vaccine	Nil
Three doses	Nil	0.5 ml if more than 1 year since third dose of vaccine	Nil

a period of four weeks. Long-term immunity against tetanus is conferred by giving further doses: see table.

Children: As for adults.

Treatment of tetanus: Adults: 30–300 i.u. per kilogram body weight given intramuscularly.

Children: As for adults.

Contra-indications, warnings, etc

Contra-indications: Humotet should not be given intravenously. The administration of immunoglobulin may be contra-indicated by a history of anaphylaxis resulting from administration of a previous dose of human gamma-globulin.

Precautions: Humotet should not be given concurrently with tetanus in simple solution.

Although anaphylaxis is rare, facilities for its management should always be available during vaccination.

Side- and adverse effects: A local reaction, consisting of a small area of inflammation and tenderness, may occur after administration of the immunoglobulin, but this rarely constitutes more than a temporary inconvenience. Constitutional upsets, and particularly anaphylactic reactions, are uncommon. Patients with antibody deficiency syndromes may be liable to have local reactions after administration of the immunoglobulin.

Use in pregnancy and lactation: Accurate information is not available on the safety of Humotet in pregnancy.

Toxicity and treatment of overdosage: Not applicable.

Pharmaceutical precautions Store at 2–8°C.

Do not freeze.

Legal category POM.

Package quantities Vial containing 250 i.u. in 1.0 ml.

Further information Nil.

Product licence number 0003/0087.

IMURAN* TABLETS AND INJECTION

Presentation Each tablet contains 50 mg Azathioprine BP coded 'Wellcome K7A' and is yellow. Each vial of injection contains the equivalent of 50 mg Azathioprine BP as its sodium salt, freeze-dried.

Uses Imuran (Tablets and Injection) facilitates the survival and function of organ transplants.

Imuran Tablets have a significant therapeutic effect in a proportion of patients suffering from chronic active hepatitis, severe rheumatoid arthritis, systemic lupus erythematosus (SLE), idiopathic thrombocytopenic purpura, acquired haemolytic anaemia, severe cases of specified dermatological diseases (pemphigus vulgaris, dermatomyositis, polyarteritis nodosa, pyoderma gangrenosa) when these conditions are: (a) refractory to corticosteroids or (b) when corticosteroids are contra-indicated or (c) controlled by corticosteroids in dosages which are producing severe side-effects. In patients with such side-effects, the aim of Imuran medication is to reduce the required maintenance dose of steroids.

In pemphigus and rheumatoid arthritis Imuran has been shown to have significant therapeutic activity when used without corticosteroids.

The risks associated with Imuran therapy should be considered against the severity of the patient's condition and the expected clinical effect.

The use of Imuran in other indications must be regarded as experimental.

Dosage and administration *Adults:* Imuran Tablets are given by mouth, but patients unable to take oral medication may be given Imuran Injection for a short period.

Transplantation: A loading dose of up to 5 mg/kg orally or intravenously is usually given. The dosage during the first three months after transplantation is usually 1.0–4.0 mg/kg body weight per day (median 2.4 mg/kg body weight per day). 1.0–2.5 mg/kg body weight per day may be given intravenously as a maintenance dose, but only if oral therapy is impracticable. Cessation of Imuran therapy, even after a period of years, carries a high risk of rejection within a few weeks.

Other conditions: for the treatment of the conditions listed under *Uses*, except for chronic active hepatitis, the dosage is usually between 2.0 and 2.5 mg/kg body weight per day. For the treatment of chronic active hepatitis the dosage is usually between 1.0 and 1.5 mg/kg body weight per day.

The dosage of Imuran and the duration of treatment may vary according to the condition, its severity and the clinical response obtained. A therapeutic response may not be evident for a few days or even weeks after initiation of Imuran therapy. If no discernible improvement occurs in the patient's condition within three months, consideration should be given to the withdrawal of the drug. Treatment is otherwise undertaken on a long-term basis unless the patient exhibits evidence of intolerance to the drug.

Administration by intravenous injection (in transplantation only): the contents of each vial should be dissolved in not less than 5 ml of sterile pyrogen-free water for injection. The solution is alkaline and very irritant and must, therefore, be given slowly (not less than one minute) and then flushed through with at least 50 ml of physiological saline or glucose saline. The solution should be prepared immediately before use and any remainder discarded. There are no data on the compatibility of Imuran Injection with other intravenous fluids.

Children: As for adults.

Contra-indications, warnings, etc

Contra-indications: Imuran hypersensitivity will generally be a contra-indication to continued use.

Precautions: There are potential hazards in the use of this preparation. Therefore, it should not be prescribed unless the patient can be adequately monitored for toxic effects throughout the duration of the therapy.

During the first eight weeks of therapy with Imuran complete blood counts, including platelet counts, must be performed at least weekly (and more frequently when higher dosages are used or in the presence of disturbed renal or hepatic function), and with decreasing frequency thereafter.

Imuran may be given long-term unless the patient cannot tolerate the preparation. Withdrawal of an effective dose in certain instances, e.g. SLE with nephritis, may result in a serious relapse of the condition. In other instances, such as rheumatoid arthritis and certain haematological conditions, treatment may be withdrawn after a suitable interval without any ill-effect. Withdrawal should always be a gradual process performed under close supervision.

In the presence of severe renal or hepatic impairment careful monitoring is initially required, since the dosage of Imuran may have to be reduced.

Severe secondary infections, often with uncommon organisms, are a hazard of immunosuppressive therapy

y in transplant recipients or other indications.

enic and has been shown ge in man. The clinical unclear since the damage withdrawal of Imuran.

hibitory effect on either depression of fertility ia is generally reversed accompanying azathioprine

stro-intestinal intolerance an is variable. It is mani-anorexia with occasional eems to be a dose-related interruption administration itstituted, at a lower dose. be taken with food. Other complications of therapy is is seen most commonly as also been reported in owel disease treated with

estinal haemorrhage and ration are complications

seen only after transplantation and it appears likely that they are due to concomitant steroid therapy.

Imuran may occasionally cause cholestatic, dose-related reversible hepatotoxicity. In such cases it is advisable to withdraw Imuran. A variety of possibly allergic manifestations has been reported. Drug fever, skin rash, myalgia and arthralgia are well documented though uncommon complications. There are also single case reports of possible Imuran-related effects including acute renal insufficiency, haemolytic anaemia, acute restrictive lung disease and unexplained meningitic reactions.

Use in pregnancy and lactation: The potential teratogenicity of Imuran should be borne in mind. Although it has been shown to be teratogenic in laboratory animals clinical evidence suggests that the risk is not appreciable in man. There is no doubt that Imuran and its metabolites cross the placenta. A temporary impairment of immune function has been noted following exposure *in utero* to Imuran combined with prednisone. The long-term consequences of these properties of Imuran are unknown, but many children exposed *in utero* have now completed the first decade of life without reported problems.

It has not been possible to detect Imuran or its metabolites in the breast milk of treated patients.

Toxicity and treatment of overdosage: The most likely side-effect of overdosage is bone marrow depression, which may not reach its maximum until 9–14 days later. A single large dose of Imuran is less likely to have a toxic effect than a chronic minor overdosage on prescription. Although the effects of overdosage may be delayed it is not uncommon for improvement to commence after day 12 provided that the patient has not had high doses during the intervening period. If overdosage occurs the blood picture and hepatic function in particular should be monitored. Imuran is known to be dialysable and dialysis may be used in severe cases.

Pharmaceutical precautions *Tablets:* Store below 25°C. Protect from light. Keep dry.

Injection: Store below 25°C. Protect from light. Keep dry.

Legal category POM.

Package quantities Bottle of 100 tablets. Single vials.

INSULINS

NEUSULIN*

Neutral Insulin Injection BP WELLCOME*

Presentation Neusulin insulin is a clear neutral solution of purified crystalline insulin.

pH 7.3 ± 0.7 .

It is available in strengths of 40 and 80 units per ml.

This insulin is prepared from ox pancreas.

Uses For the management of diabetes mellitus. Wellcome purified insulin may be helpful in obviating or resolving problems sometimes encountered with standard insulin therapy; local skin reactions, lipatrophy, generalised insulin allergy, and insulin resistance/high daily dose requirement.

Dosage and administration *Adults and children:* The daily unit dosage of insulin is determined by the physician in accordance with the patient's requirements.

Neusulin is administered by subcutaneous, intramuscular or intravenous injection. The site of each injection should be changed according to a suitable routine.

Accidental intravascular injection should be avoided.

Subcutaneous: Onset of action occurs within 30–60 minutes, with an overall duration of action of approximately 6–8 hours. Consequently, 2 or 3 injections daily before meals may be appropriate if not used in combination with other insulins.

Intramuscular: Onset of action is more rapid and overall duration of action shorter than with the subcutaneous route, assuming adequate vascular perfusion.

Intravenous: Onset of action is most rapid and duration of action shortest with this route. It is usually reserved either for investigational purposes, or for the management of diabetic ketoacidosis. See literature for details of continuous low-dose insulin infusion.

Note: Insulin may adsorb to surfaces of the infusion apparatus and other infusion constituents.

Transfer from standard insulin: When patients treated with standard bovine insulin are transferred to Wellcome purified bovine insulin, there is no general decrease in dose requirement in the short term. Neusulin may therefore be conveniently given in similar unit dosage to the corresponding standard insulins, without risk of provoking sudden hypoglycaemia.

Contra-indications, warnings, etc

Contra-indications: Hypoglycaemia is an absolute contra-indication.

Precautions: Variation in lifestyle and other factors, e.g. infection and pregnancy, can affect insulin requirements.

Insulin dosage requirement may change if the species of origin, type, or purity of insulin is changed.

Hypoglycaemia can be enhanced by drugs including the following: aspirin, sulphonylureas and agents affecting them; certain steroids.

Hyperglycaemia can be enhanced by drugs including the following: triiodothyronine; thyroxine; various natural and synthetic steroids, including some oral contraceptives; diuretics, including thiazides; certain psychotherapeutic agents, including benzodiazepines; cyclophosphamide.

Certain β -blockers, especially propranolol, may affect insulin requirements and mask the signs of hypoglycaemia mediated by the sympathetic nervous system.

Monoamine oxidase (M.A.O.) inhibitors may potentiate the action of insulin.

Side- and adverse effects: The most important side-effect is hypoglycaemia.

Reduction of hyperglycaemia in newly diagnosed diabetics may alter visual refraction.

Local reactions at the injection site may include, among others, transient erythema, induration, urticaria and oedema. These usually resolve with continuing use of insulin.

True generalised hypersensitivity reactions approaching anaphylaxis are very rare.

Clinical evidence suggests that purified insulins are unlikely to cause localised lipodystrophies. However, at present this possibility cannot be totally excluded.

Use in pregnancy and lactation: It is essential to maintain continuous good control of the insulin-requiring diabetic patient throughout pregnancy. In the insulin-treated

(gestational or insulin-dependent) pregnant diabetic patient, the insulin requirements fall in the first trimester and increase during the second and third trimester.

Breast-feeding is probably best avoided in insulin-dependent diabetic mothers because of their metabolic instability.

Toxicity and treatment of overdosage: The symptoms and signs of hypoglycaemia depend on the patient's clinical state and on the rate and extent of the fall in blood glucose.

If possible, glucose, sucrose or rapidly available carbohydrate should be taken by mouth. Failing this, hypoglycaemia should be reversed as rapidly as possible by intravenous injection of glucose 50% solution. Alternative emergency treatments include the subcutaneous injection of up to 1 ml of adrenaline solution 1:1000, or the subcutaneous, intramuscular or intravenous injection of lyophilised glucagon 0.5–1.0 mg (1 unit = 1.0 mg). Both adrenaline and glucagon injections mobilise hepatic glycogen, but the effect is short-lived, and must be supplemented by freely available carbohydrate as soon as possible.

Pharmaceutical precautions Store at 2–8°C.

Do not freeze.

Avoid direct sunlight.

Legal category P.

Package quantities

40 units/ml vial of 10 ml

80 units/ml vial of 10 ml

Further information *Mixing in the syringe:* Neusulin insulin can be mixed with Neuphane or Neulente insulin. If, on medical advice, Neusulin insulin is to be mixed in the syringe with one of these long-acting purified insulins, the following procedure should be adopted:

1. Inject a volume of air equivalent to the dose into the bottle of long-acting insulin, without inverting the bottle or withdrawing the dose.

2. Inject the appropriate volume of air into the bottle of Neusulin insulin and withdraw the dose in the usual way.

3. Re-insert the needle into the long-acting insulin and withdraw the appropriate dose.

4. Inject the mixture immediately.

Mixing of purified with standard preparations is not recommended, since this would result in the loss of their special advantages.

Further information is available on request.

NEUPHANE*

Isophane Insulin Injection BP WELLCOME*

Presentation Neuphane insulin is a cloudy neutral suspension of an insulin (purified)/protamine complex. pH 7.2 ± 0.3

It is available in strengths of 40 and 80 units per ml.

This insulin is prepared from ox pancreas.

Uses For the management of diabetes mellitus. Wellcome purified insulins may be helpful in obviating or resolving problems sometimes encountered with standard insulin therapy; local skin reactions, lipodystrophy, generalised insulin allergy and insulin resistance/high daily dose requirement.

Dosage and administration *Adults and children:* The daily unit dosage of insulin is determined by the physician in accordance with the patient's requirements.

Neuphane insulin should be well mixed by inverting the vial several times before use. It is administered by subcutaneous or intramuscular injection.

The site of each injection should be changed according to a suitable routine.

Accidental intravascular injection should be avoided.

Subcutaneous: Onset of action occurs within 2 hours, with an overall duration of action which may extend to 20–24 hours.

Intramuscular: Onset of action is more rapid and overall duration of action shorter than with the subcutaneous route, assuming adequate vascular perfusion.

Neuphane insulin should not be given intravenously.

Transfer from standard insulin: When patients treated with standard bovine insulin are transferred to Wellcome purified bovine insulin, there is no general decrease in dose requirement in the short term. Neuphane may therefore be conveniently given in similar unit dosage to the corresponding standard insulin, without risk of provoking sudden hypoglycaemia.

Contra-indications, warnings, etc

Contra-indications: Hypoglycaemia is an absolute contra-indication.

Precautions: Variation in lifestyle and other factors, e.g. infection and pregnancy, can affect insulin requirements.

Insulin dosage requirement may change if the species of origin, type, or purity of insulin is changed.

Hypoglycaemia can be enhanced by drugs including the following: aspirin, sulphonylureas and agents affecting them; certain steroids.

Hyperglycaemia can be enhanced by drugs including the following: triiodothyronine; thyroxine; various natural and synthetic steroids, including some oral contraceptives; diuretics, including thiazides; certain psychotherapeutic agents, including benzodiazepines; cyclophosphamide.

NEULENTE*

Insulin Zinc Suspension BP WELLCOME*

Presentation Neulente insulin is a neutral suspension of purified insulin consisting of 3 parts Semilente and 7 parts Ultralente insulin.

Appearance is cloudy after shaking.

pH 7.2 ± 0.3

It is available in strengths of 40 and 80 units per ml.

This insulin is prepared from ox pancreas.

Uses For the management of diabetes mellitus. Wellcome purified insulins may be helpful in obviating or resolving problems sometimes encountered with standard insulin therapy; local skin reactions, lipodystrophy, generalised insulin allergy and insulin resistance/high daily dose requirement.

Dosage and administration *Adults and children:* The daily unit dosage of insulin is determined by the physician in accordance with the patient's requirements.

Neulente insulin should be well mixed by gently inverting the vial several times before use. It should be administered by subcutaneous or intramuscular injection.

The site of each injection should be changed according to a suitable routine.

Accidental intravascular injection should be avoided.

Subcutaneous: Onset of action occurs within 2 hours, with an overall duration of action which may extend to 24–28 hours.

Intramuscular: Onset of action is more rapid and overall duration of action shorter than with the subcutaneous route, assuming adequate vascular perfusion.

Neulente insulin should not be given intravenously.

Transfer from standard insulin: When patients treated with standard bovine insulin are transferred to Wellcome purified bovine insulin, there is no general decrease in dose requirement in the short term, Neulente may therefore be conveniently given in similar unit dosage to the corresponding standard insulin, without risk of provoking sudden hypoglycaemia.

Contra-indications, warnings, etc

Contra-indications: Hypoglycaemia is an absolute contra-indication.

Precautions: Variation in lifestyle and other factors, e.g. infection and pregnancy, can affect insulin requirements.

Insulin dosage requirement may change if the species of origin, type, or purity of insulin is changed.

Hypoglycaemia can be enhanced by drugs including the following: aspirin, sulphonylureas and agents affecting them; certain steroids.

Hyperglycaemia can be enhanced by drugs including the following: triiodothyronine; thyroxine; various natural and synthetic steroids including some oral contraceptives; diuretics, including thiazides; certain psychotherapeutic agents, including benzodiazepines; cyclophosphamide.

Certain β -blockers, especially propranolol, may affect insulin requirements and mask the signs of hypoglycaemia mediated by the sympathetic nervous system.

Monoamine oxidase (M.A.O.) inhibitors may potentiate the action of insulin.

Side- and adverse effects: The most important side-effect is hypoglycaemia.

Reduction of hyperglycaemia in newly diagnosed diabetics may alter visual refraction.

Local reactions at the injection site may include, among others, transient erythema, induration, urticaria and oedema. These usually resolve with continuing usage of insulin.

True generalised hypersensitivity reactions approaching anaphylaxis are very rare.

Clinical evidence suggests that purified insulins are unlikely to cause localised lipodystrophies. However, at present this possibility cannot be totally excluded.

Use in pregnancy and lactation: It is essential to maintain continuous good control of the insulin-requiring diabetic patient throughout pregnancy. In the insulin-treated (gestational or insulin-dependent) pregnant diabetic patient, the insulin requirements fall in the first trimester and increase during the second and third trimester.

Breast-feeding is probably best avoided in insulin-dependent diabetic mothers because of their metabolic instability.

Toxicity and treatment of overdosage: The symptoms and signs of hypoglycaemia depend on the patient's

clinical state and on the rate and extent of the fall in blood glucose.

If possible, glucose, sucrose or rapidly available carbohydrate should be taken by mouth. Failing this hypoglycaemia should be reversed as rapidly as possible by intravenous injection of glucose 50% solution. Alternative emergency treatments include the subcutaneous injection of up to 1 ml of adrenaline solution 1:1000, or the subcutaneous, intramuscular or intravenous injection of lyophilised glucagon 0.5–1.0 mg (1 unit = 1.0 mg). Both adrenaline and glucagon injections mobilise hepatic glycogen, but the effect is short lived and must be supplemented by freely available carbohydrate as soon as possible.

Pharmaceutical precautions Store at 2–8°C.

Do not freeze.

Avoid direct sunlight.

Legal category P.

Package quantities

80 units/ml vial of 10 ml

Further information *Mixing in the syringe:* Neulente insulin can be mixed with Neusulin insulin. If, *on medical advice*, Neulente insulin is to be mixed in the syringe with Neusulin insulin, the following procedure should be adopted:

1. Inject a volume of air equivalent to the dose into the bottle of Neulente insulin, without inverting the bottle or withdrawing the dose.

2. Inject the appropriate volume of air into the bottle of Neusulin insulin and withdraw the dose in the usual way.

3. Re-insert the needle into the Neulente insulin and withdraw the appropriate dose.

4. Inject the mixture immediately.

Mixing of purified with standard preparations is not recommended, since this would result in the loss of their special advantages.

Further information is available on request.

SOLUBLE

Insulin Injection BP WELLCOME*

Presentation Soluble Insulin Injection BP is a clear acidic solution of crystalline insulin in strengths of 20, 40 and 80 units per ml.

This insulin is prepared from ox pancreas

Uses For the management of diabetes mellitus.

Dosage and administration *Adults and children* The daily unit dosage of insulin is determined by the physician in accordance with the patient's requirements.

It is administered by subcutaneous, intramuscular or intravenous injection. The site of each injection should be changed according to a suitable routine.

Accidental intravascular injection should be avoided.

Subcutaneous: Onset of action occurs within 30–60 minutes, with an overall duration of action of approximately 6–8 hours. Consequently, 2 or 3 injections daily before meals may be appropriate if not used in combination with other insulins.

is more rapid and overall with the subcutaneous ular perfusion.

SEMILENTE*

Insulin Zinc Suspension (Amorphous) BP

WELLCOME*

ULTRALENTE*

Insulin Zinc Suspension (Crystalline) BP

WELLCOME*

Presentation Semilente insulin is a neutral suspension containing amorphous insulin with zinc in acetate buffer, in strengths of 40 and 80 units per ml.

Ultralente insulin is a neutral suspension containing crystalline insulin with zinc in acetate buffer in strengths of 40 and 80 units per ml.

These insulins are prepared from ox pancreas.

Uses For the management of diabetes mellitus.

Dosage and administration *Adults and children:* The daily unit dosage of insulin is determined by the physician in accordance with the patient's requirements.

It should be administered by subcutaneous or intramuscular injection.

The site of each injection should be changed according to a suitable routine.

Accidental intravascular injection should be avoided.

The insulin zinc suspensions should be shaken gently in the bottle before use.

Transfer to purified insulin: When patients treated with standard bovine insulin are transferred to Wellcome purified bovine insulin, there is no general decrease in dose requirement in the short term.

Contra-indications, warnings, etc

Contra-indications: Hypoglycaemia is an absolute contra-indication.

Precautions: Variation in lifestyle and other factors, e.g. infection and pregnancy, can affect insulin requirements.

Insulin dosage requirement may change if the species of origin, type, or purity of insulin is changed.

Hypoglycaemia can be enhanced by drugs including the following: aspirin, sulphonylureas and agents affecting them; certain steroids.

Hyperglycaemia can be enhanced by drugs including the following: triiodothyronine, thyroxine, various natural and synthetic steroids including some oral contraceptives, diuretics, including thiazides, certain psychotherapeutic agents, including benzodiazepines, cyclophosphamide.

Certain β -blockers, especially propranolol, may affect insulin requirements, and mask the signs of hypoglycaemia mediated by the sympathetic nervous system.

Monoamine oxidase (M.A.O.) inhibitors may potentiate the action of insulin.

Side- and adverse effects: The most important side-effect is hypoglycaemia.

Reduction of hyperglycaemia in newly diagnosed diabetics may alter visual refraction.

Local reactions at the injection site may include, among others, transient erythema, induration, urticaria and oedema. These usually resolve with continuing usage of insulin.

True generalised hypersensitivity reactions approaching anaphylaxis are very rare.

Use in pregnancy and lactation: It is essential to maintain continuous good control of the insulin-requiring diabetic patient throughout pregnancy. In the insulin-treated (gestational or insulin-dependent) pregnant diabetic patient, the insulin requirements fall in the first trimester and increase during the second and third trimester.

Breast-feeding is probably best avoided in insulin-dependent diabetic mothers because of their metabolic instability.

Toxicity and treatment of overdosage: The symptoms and signs of hypoglycaemia depend on the patient's clinical state and on the rate and extent of the fall in blood glucose.

If possible, glucose, sucrose or rapidly available carbohydrate should be taken by mouth. Failing this, hypoglycaemia should be reversed as rapidly as possible by intravenous injection of glucose 50% solution. Alternative emergency treatments include the subcutaneous injection of up to 1 ml of adrenaline solution 1:1000, or the subcutaneous, intramuscular or intravenous injection of lyophilised glucagon 0.5–1.0 mg (1 unit = 1.0 mg). Both adrenaline and glucagon injections mobilise hepatic glycogen, but the effect is short-lived and must be supplemented by freely available carbohydrate as soon as possible.

Pharmaceutical precautions Store at 2–8°C.

GLOBIN

Zinc Insulin Injection BP WELLCOME® PROTAMINE

Zinc Insulin Injection BP WELLCOME®

Presentation Globin zinc insulin is a clear, solution containing insulin with globin and a percentage of zinc, in a strength of 80 units per ml.

Protamine zinc insulin is a neutral suspension of protamine, zinc and insulin, in strengths of 40 units per ml.

These insulins are prepared from ox pancreas.

Uses For the management of diabetes mellitus.

Dosage and administration *Adults and children:* The daily unit dosage of insulin is determined by the physician in accordance with the patient's requirements.

Administered subcutaneously. It should not be given intravenously.

The site of each injection should be changed according to a suitable routine.

Accidental intravascular injection should be avoided.

Protamine zinc insulin should be shaken gently before use.

Transfer to purified insulins: When patients treated with standard bovine insulin are transferred to Wellcome purified bovine insulin, there is no general decrease in requirement in the short term.

Contra-indications, warnings, etc

Contra-indications: Hypoglycaemia is an absolute contra-indication.

Precautions: Variation in lifestyle and other factors, such as infection and pregnancy, can affect insulin requirements.

Insulin dosage requirement may change if the origin, type, or purity of insulin is changed.

Hypoglycaemia can be enhanced by drugs including the following: aspirin, sulphonylureas and agents which inhibit insulin action; certain steroids.

Hyperglycaemia can be enhanced by drugs including the following: triiodothyronine; thyroxine; various natural and synthetic steroids, including some oral contraceptives; diuretics, including thiazides; certain psychotherapeutic agents, including benzodiazepines, cyclophosphamide.

Certain β -blockers, especially propranolol, may affect insulin requirements and mask the signs of hypoglycaemia mediated by the sympathetic nervous system.

Monoamine oxidase (M.A.O.) inhibitors may potentiate the action of insulin.

Side- and adverse effects: The most important side-effect is hypoglycaemia.

Reduction of hyperglycaemia in newly diagnosed diabetics may alter visual refraction.

Local reactions at the injection site may include, among others, transient erythema, induration, urticaria and oedema. These usually resolve with continuing usage of insulin.

True generalised hypersensitivity reactions approaching anaphylaxis are very rare.

Use in pregnancy and lactation: It is essential to maintain continuous good control of the insulin-requiring diabetic patient throughout pregnancy. In the insulin-treated (gestational or insulin-dependent) pregnant diabetic patient, the insulin requirements fall in the first trimester and increase during the second and third trimester.

Breast-feeding is probably best avoided in insulin-dependent diabetic mothers because of their metabolic instability.

Toxicity and treatment of overdosage: The symptoms and signs of hypoglycaemia depend on the patient's clinical state and on the rate and extent of the fall in blood glucose.

If possible, glucose, sucrose or rapidly available carbohydrate should be taken by mouth. Failing this, hypoglycaemia should be reversed as rapidly as possible by intravenous injection of glucose 50% solution. Alternative emergency treatments include the subcutaneous injection of up to 1 ml of adrenaline solution 1000, or the subcutaneous, intramuscular or intravenous injection of lyophilised glucagon 0.5–1.0 mg (unit = 1.0 mg). Both adrenaline and glucagon injections mobilise hepatic glycogen, but the effect is short-acted and must be supplemented by freely available carbohydrate as soon as possible.

Pharmaceutical precautions Store at 2–8°C.

Do not freeze.

Avoid direct sunlight.

Legal category P.

Package quantities *Globin Zinc Insulin Injection BP:* 10 units per ml; bottle of 10 ml.

Protamine Zinc Insulin Injection BP: 40 and 80 units per ml; bottles of 10 ml.

Further information *Mixing in the syringe:* Globin and protamine insulin may be mixed in the syringe, on medical advice, with soluble or neutral insulin if required. However, because of a variable diminution of immediate effect, the combination of protamine with either soluble or neutral insulin is not recommended. Mixing of standard with purified insulin preparations is not recommended since this would result in the loss of the latter's special advantages.

EMADRIN* TABLETS AND INJECTION

Representation *Tablets:* Each white tablet containing 10 mg Procyclidine Hydrochloride BP is scored and coded 'Wellcome S3A'.

Injection: Each 2 ml ampoule contains 10 mg Procyclidine Hydrochloride BP.

Uses Kemadrin is indicated in all forms of Parkinson's disease: idiopathic (paralysis agitans), postencephalitic and arteriosclerotic.

Symptoms often responding well to Kemadrin include: rigidity, akinesia, tremor, speech and writing difficulties, sialorrhoea and drooling, sweating, oculogyric crises and depressed mood.

Kemadrin is also used to control troublesome extrapyramidal symptoms induced by neuroleptic drugs including pseudo-parkinsonism, acute dystonic reactions and akathisia.

Dosage and administration The variation in optimum dosage from one patient to another should be taken into consideration by the physician. Treatment is usually started at 2.5 mg three times a day, increasing by 2.5–5 mg daily at intervals of two or three days until the optimum clinical response is achieved. The usual maximum total daily dose is 30 mg. However, at the discretion of the attending physician where appropriate this total may be as high as 60 mg.

The daily dosage used in the control of neuroleptic-induced extrapyramidal symptoms is usually not more than 20 mg daily. After a period of 3–4 months, Kemadrin should be stopped and the patient observed to see if the neuroleptic-induced extrapyramidal symptoms recur. Cessation of treatment periodically is to be recommended even in patients who appear to require the drug for longer periods.

Kemadrin may be combined with levodopa or amantadine in patients who are inadequately controlled on a single agent.

In acute dystonia 5 mg Kemadrin intravenously is frequently effective within 5 minutes. An occasional patient may need 10 mg or more and may require up to half an hour to obtain relief.

Pharmacology: Procyclidine is a synthetic anticholinergic agent which blocks the excitatory effects of acetylcholine at the muscarinic receptor.

Idiopathic Parkinson's disease is now thought to result from degeneration of neurones in the substantia nigra whose axons project and inhibit cells in the corpus striatum. Blockade by neuroleptic drugs of the dopamine released by these terminals produces a similar clinical picture. The cell bodies in the corpus striatum also receive cholinergic innervation which is excitatory. Relief of the parkinsonian syndrome can be achieved either by potentiation of the dopaminergic system or blockade of the cholinergic input by anticholinergics. It is by a central action of this latter type that procyclidine exerts its effect.

Procyclidine is adequately absorbed from the gastrointestinal tract and disappears rapidly from the tissues. After intravenous administration it acts within 5 to 20 minutes with a duration of up to 4 hours. No information is available on its metabolic fate and excretion.

Contra-indications, warnings, etc

Contra-indications: There are no known contra-indications to the use of Kemadrin.

Precautions: As with all anticholinergics such as Kemadrin, cautious prescribing is indicated in patients predisposed to glaucoma, obstructive disease of the gastro-intestinal tract and those with urinary symptoms associated with prostatic hypertrophy.

In a proportion of patients undergoing neuroleptic treatment, tardive dyskinesias will occur. While anticholinergic agents do not cause this syndrome, when given in combination with neuroleptics they may reduce the threshold at which dyskinesias appear in patients predisposed to this abnormality. In such individuals subsequent adjustment of neuroleptic therapy is indicated.

Use in pregnancy and lactation: The safety of using Kemadrin during pregnancy has not been established. However, extensive clinical use has not given any evidence that in any way compromises the normal course of pregnancy. No data are available on the excretion of this drug in breast milk.

Side- and adverse effects: The main side-effects are those to be expected from any anticholinergic agent. Dry mouth, blurring of vision and constipation are most commonly recorded. At higher doses dizziness, mental confusion and hallucinations may occur. The unwanted anticholinergic effects are easily reversed by reducing the dosage.

Toxicity and treatment of overdosage: Reports of overdosage are relatively rare. Symptoms of overdosage are agitation, restlessness and confusion with severe sleeplessness lasting up to 24 hours or more. Visual and

occasionally auditory hallucinations are likely. Most subjects are euphoric but the occasional patient may be anxious and aggressive. The pupils are widely dilated and unreactive to light. In recorded cases, the disorientation has lasted 1 to 4 days and ended in recuperative sleep.

If procyclidine has been ingested within the previous hour or two (or possibly longer in view of its likely effects on gastric motility) then gastric lavage is probably indicated. Other active measures such as the use of cholinergic agents or haemodialysis are extremely unlikely to be of clinical value, although if convulsions occur they should be controlled by injections of diazepam.

Pharmaceutical precautions *Tablets and injection:* Store below 25°C.

Legal category POM.

Package quantities Bottles of 100 and 500 tablets. Ampoule of 10 mg in 2 ml. Box of 5 ampoules.

Further information Drowsiness and depressed mood are not a problem and several patients in a study had considerably less fatigue and more energy and drive when transferred from other anticholinergic agents to Kemadrin.

LANOXIN* TABLETS

LANOXIN-125* TABLETS

LANOXIN-PG* TABLETS

LANOXIN* INJECTION

LANOXIN-PG* ELIXIR

Presentation Lanoxin tablets each contain 250 mcg (0.25 mg) of Digoxin BP, scored and coded Wellcome X3A, white in colour.

Lanoxin-125 Tablets each contain 125 mcg (0.125 mg) of Digoxin BP coded Wellcome Y3B, white in colour.

Lanoxin-PG (Paediatric/Geriatric) Tablets each contain 62.5 mcg (0.0625 mg) of Digoxin BP, coloured blue and coded Wellcome U3A.

Lanoxin Injection contains 250 mcg (0.25 mg) of Digoxin BP per ml in each 2 ml ampoule.

Lanoxin-PG (Paediatric/Geriatric) Elixir contains 50 mcg (0.050 mg) of Digoxin BP in each ml. Clear bright yellow in colour and lime flavoured.

Uses Lanoxin is indicated whenever digitalis therapy is required. It is of particular value in congestive heart failure and in certain cardiac arrhythmias, especially in atrial fibrillation.

Dosage and administration The suggested doses are intended only as a guide, as doses will have to be adjusted for each individual patient. Larger doses are necessary for the control of flutter and fibrillation than to improve the contractility of a failing heart still in sinus rhythm. Lanoxin Injection can be administered undiluted, either by intravenous or intramuscular route, but the latter should only be employed when no other route of administration is available, as it is likely to prove painful, and absorption may be unpredictable. Subcutaneous injection is not recommended as it causes intense local irritation.

When given intravenously, it may be diluted with Sodium Chloride 0.9% Injection BP or Dextrose 5% Injection BP, or Sodium Chloride 0.18%+Dextrose 4% Injection BP. The injection should be given slowly. The intramuscular route provides a similar rate of absorption to that of the oral route. Lanoxin-PG Elixir should be given undiluted.

Adults:

1. Rapid oral digitalisation: 0.75–1.5 mg followed by 0.25 mg at six-hourly intervals until optimal therapeutic effect has been obtained, or in cases of atrial fibrillation the ventricular rate lies between 70–80 beats per minute. The appearance of toxic symptoms before any therapeutic response is apparent must call for a review of the clinical situation.

2. Slow oral digitalisation: 0.25–0.75 mg daily, clinical improvement usually being seen in one to three weeks.

3. Emergency parenteral digitalisation: 0.5–1.0 mg intravenously (slowly) followed by 0.5 mg usually given and repeated, if necessary, after a few hours. It may be given undiluted intramuscularly with intervals of four to five hours between doses.

4. Maintenance (all routes): 0.25–0.5 mg daily as required. Best given in divided doses. It is recommended that digitalis therapy in elderly patients be carried out gradually, and with smaller doses, except in an emergency.

Peritoneal and haemo-dialyses remove only a very small percentage of digoxin and patients receiving such therapy should not require any adjustment to the maintenance dosage.

Children over 10 years: As for adults.

Infants and children under 10 years:

1. Digitalisation (all routes): 0.01–0.02 mg/kg body weight repeated six-hourly until therapeutic result obtained, 2–4 doses usually being sufficient.

2. Maintenance: 0.01–0.02 mg/kg body weight daily for a few days, after which the dose can be adjusted as necessary.

Contra-indications, warnings, etc

Contra-indications: The only absolute contra-indication to Lanoxin is toxicity due to cardiac glycosides. ventricular paroxysmal tachycardia or ventricular fibrillation Lanoxin is indicated only in refractory cases not induced by digitalis intoxication and where heart failure has developed.

Precautions: When digoxin is administered intravenously there is an element of risk that it may cause cardiac dysrhythmia with a possibly fatal result, and this must be weighed against the gravity of the emergency. The risk is greatly increased if the patient is already or has recently been receiving a cardiac glycoside. A smaller dose of Lanoxin should be given initially and as maintenance renal clearance is reduced (as in the elderly or in patients with moderate or severe renal disease). The doses suggested may produce evidence of toxicity in patients with acute myocardial infarction, severe pulmonary disease, advanced heart failure and in premature infants and elderly patients. Disturbances in electrolyte balance may occur as a result of the use of diuretics and other agents. The change in electrolyte balance may influence the response to digoxin. In hypokalaemia and hypomagnesaemia, the dose of Lanoxin should be reduced until the deficiencies are corrected. Disturbances in calcium levels may also modify the response to digoxin. Hypothyroid patients generally require less Lanoxin and

fluctuating states in thyroid function will call for adjustments in Lanoxin dosage.

Cardiac surgery and cardioversion may be associated with an enhanced liability to post-operative arrhythmias in the presence of digoxin plasma levels which would otherwise be considered normal. Lanoxin should therefore be withdrawn for 72 hours prior to such procedures whenever possible.

Plasma digoxin concentrations rise when quinidine is given concomitantly. Lithium treatment may potentiate the effects of digoxin. Some antacid constituents affect the bioavailability of digoxin if taken simultaneously. Digoxin activities are potentiated when the extracellular potassium levels are decreased, as occurs frequently with concomitant diuretic therapy.

de- and adverse effects: Side-effects are principally associated with signs of overdosage and usually disappear within a few hours of withdrawing the drug, and may include anorexia, nausea, vomiting, headache, fatigue and visual disturbances. There may be arrhythmias and bradycardia. Gynaecomastia occurs infrequently. Allergy, though very rare, does occur.

use in pregnancy and lactation: Lanoxin has been available since 1929 and there have been no reports to date of any teratogenic effects. A recent paper showed that digoxin is excreted in breast milk but not in clinically significant amounts.

Toxicity and treatment of overdosage: Common symptoms include nausea and vomiting. Supraventricular rhythmias with heart block and bradycardia have often been reported. Mild to pronounced hyperkalaemia is likely to be present. With chronic poisoning ventricular ectopic beats and other dysrhythmias are common.

Treatment of overdosage is by means of gastric lavage and ECG monitoring. For hypokalaemia give potassium. For hyperkalaemia give glucose and insulin. For bradycardia give atropine. For tachycardia and dysrhythmias give lignocaine and/or propranolol.

pharmaceutical precautions *Tablets:* Store below 5°C.

Elixir: Store below 25°C. Protect from light.

Injection: Store below 25°C. Protect from light.

legal category POM.

package quantities *Lanoxin tablets:* Bottles of 500 and 1,000; container of 5,000.

Lanoxin-125 Tablets: Bottle of 500.

Lanoxin Injection: Ampoule of 2 ml; box of 5 ampoules.

Lanoxin-PG Elixir: Bottle of 60 ml.

Lanoxin-PG Tablets: Bottles of 100 and 500.

further information Absorption of Lanoxin digoxin is uniform and almost complete. Duration of action is short. These characteristics improve control during digitalisation and offer an increased measure of safety.

ANVIS* TABLETS

presentation Each pale greenish yellow biconvex tablet, scored and coded Wellcome U3B, contains 40 mg thioguanine.

Uses Cytotoxic agent.

The main indication is acute myeloblastic leukaemia, but it has also been used in acute lymphoblastic and chronic granulocytic (myelocytic, myeloid, myelogenous) leukaemia.

Cross-resistance exists between Lanvis and Puri-Nethol (6-mercaptopurine) and it is not to be expected that patients who no longer respond to Puri-Nethol will respond to Lanvis or vice versa.

Dosage and administration The dosage and duration of its administration must be carefully adjusted to obtain optimum benefit without undue toxic effects.

Adults: The usual dosage of Lanvis is between 2.0 and 2.5 mg/kg body weight/day, the total daily doses being calculated to the nearest multiple of 20 mg and given at one time. The duration of drug administration will depend on the nature and dosage of other antineoplastic drugs administered with thioguanine, the patient's condition and whether early signs of toxicity occur. For induction therapy thioguanine is usually administered as one of a number of drugs for periods of 5–20 days according to the regimen adopted and the patient's tolerance.

For maintenance therapy, the usual dosage of thioguanine is 2.0 mg/kg body weight/day, but the patient must be monitored for bone-marrow toxicity, particularly if other cytotoxic drugs are given conjointly.

Children: As for adults.

Contra-indications, warnings, etc

Contra-indications: In view of the seriousness of the indications there are no absolute contra-indications.

Precautions: Lanvis is an active cytotoxic agent for use only under the direction of physicians experienced in the administration of such agents.

Since Lanvis is strongly myelosuppressive, full blood counts must be taken daily during remission induction. Patients must be carefully monitored during therapy.

The main side-effect of treatment with Lanvis is bone marrow suppression leading to leucopenia and thrombocytopenia. The leucocyte and platelet counts continue to fall after treatment is stopped, so at the first sign of an abnormally large fall in the counts, treatment should be temporarily interrupted. Bone marrow suppression is readily reversible if the drug is withdrawn early enough. During remission induction in acute myelogenous leukaemia the patient may frequently have to survive a period of relative bone marrow aplasia and it is important that adequate supportive facilities are available.

Patients on myelosuppressive chemotherapy are particularly susceptible to a variety of infections.

During remission induction, particularly when rapid cell lysis is occurring, adequate precautions should be taken to avoid hyperuricaemia and/or hyperuricosuria and the risk of uric acid nephropathy.

In view of its action on cellular DNA, Lanvis is potentially mutagenic and carcinogenic, and consideration should be given to the theoretical risk of carcinogenesis when Lanvis therapy is given. It is advised that care be taken when handling or halving these tablets not to contaminate hands or to inspire drug.

Side- and adverse effects: Gastro-intestinal intolerance has been reported. Similar intolerance has been noted with Lanvis but individual patients may tolerate either Lanvis or Puri-Nethol better than the other. At high doses gastro-intestinal symptoms may be more apparent and stomatitis has also been reported. Intestinal necrosis and perforation has been reported in patients who received combination chemotherapy including Lanvis.

Liver function abnormalities and jaundice have been reported during treatment with Lanvis and may be reversible if therapy is withdrawn. There has been a report of veno-occlusive disease of the liver occurring in patients who received combination chemotherapy including Lanvis.

Use in pregnancy and lactation: Lanvis like other cytotoxic agents is potentially teratogenic. Its use should be avoided whenever possible during pregnancy, particularly during the first trimester. In any individual case the potential hazard to the foetus must be balanced against the expected benefit to the mother. There have been isolated cases where men who have received combinations of cytotoxic agents including Lanvis have fathered children with congenital abnormalities and consideration should be given to this potential risk when treating male patients.

Mothers receiving Lanvis should not breast feed.

Toxicity and treatment of overdose: The principal toxic effect is on the bone marrow and haematological toxicity is likely to be more profound with chronic overdose than with a single ingestion of Lanvis. As there is no known antidote the blood picture should be closely monitored and general supportive measures instituted together with appropriate blood transfusion if necessary.

Pharmaceutical precautions Store below 25°C. Protect from light. Keep dry.

Legal category POM.

Package quantities Bottle of 25 tablets.

Further information The concomitant use of Zyloric* (allopurinol) to inhibit uric acid formation does not necessitate reduction of the dosage of Lanvis as is necessary with Puri-Nethol* (6-mercaptopurine) and Imuran* (azathioprine).

Product licence number 0003/0083.

LEUKERAN* TABLETS

Presentation *Leukeran Tablets:* 2 mg Chlorambucil BP, coded Wellcome C2A. Coloured yellow with white core.

5 mg Chlorambucil BP, coded Wellcome H2A. Coloured yellow with white core.

Uses Cytotoxic agent.

Leukeran is indicated in the treatment of Hodgkin's disease, certain forms of non-Hodgkin's lymphoma, chronic lymphocytic leukaemia, Waldenstrom's macroglobulinaemia and advanced ovarian adenocarcinoma. Leukeran has a significant therapeutic effect in a proportion of patients with breast cancer.

Dosage and administration *Adults: Hodgkin's disease:* Used as a single agent a typical dosage is 0.2 mg/kg/day for 4–8 weeks. Leukeran is usually included in combination therapy and a number of regimes have been used. Leukeran has been used as an alternative to nitrogen mustard with a reduction in toxicity but similar therapeutic results.

Non-Hodgkin's lymphoma: Used as a single agent the usual dosage is 0.1–0.2 mg/kg/day for 4–8 weeks initially; maintenance therapy is then given either by a reduced daily dosage or intermittent courses of treatment. Leukeran is useful in the management of patients with advanced diffuse lymphocytic lymphoma and those who have relapsed after radiotherapy. There is no

significant difference in the overall response rate obtained with chlorambucil as a single agent and combination chemotherapy in patients with advanced non-Hodgkin's lymphocytic lymphoma.

Chronic lymphocytic leukaemia: Treatment with Leukeran is usually started after the patient has developed symptoms or when there is evidence of impaired bone marrow function (but not marrow failure) as indicated by the peripheral blood count. Initially Leukeran is given at a dosage of 0.15 mg/kg/day until the total leucocyte count has fallen to 10,000 per μ l. Treatment may be resumed 4 weeks after the end of the first course and continued at a dosage of 0.1 mg/kg/day. In a proportion of patients, usually after about 2 years of treatment, the blood leucocyte count is reduced to the normal range, enlarged spleen and lymph nodes become palpable and the proportion of lymphocytes in the bone marrow is reduced to less than 20 per cent. Patients with evidence of bone marrow failure should first be treated with prednisolone and evidence of marrow regeneration should be obtained before commencing treatment with Leukeran. Intermittent high dose therapy has been compared with daily Leukeran but no significant difference in therapeutic response or frequency of side effect was observed between the two treatment groups.

Waldenstrom's macroglobulinaemia: Leukeran is a treatment of choice in this indication. Starting doses of 6–12 mg daily until leucopenia occurs are recommended followed by 2–8 mg daily indefinitely.

Ovarian carcinoma: Used as a single agent a typical dosage is 0.2 mg/kg/day for 4–6 weeks. A dosage of 0.3 mg/kg/day has been given until leucopenia has been induced. Maintenance dosage of 0.2 mg/kg/day has been given aiming to keep the total leucocyte count below 4,000/mm³. In practice, maintenance courses tend to last 2–4 weeks with intervals of 2–6 weeks between each course.

Advanced breast cancer: Used as a single agent a typical dosage is 0.2 mg/kg bodyweight per day for 6 weeks. Leukeran may be given in combination with prednisolone at a dose range of 14–20 mg daily, regardless of bodyweight, over 4–6 weeks provided there is no serious haemopoietic depression. Leukeran may be given in combination with methotrexate, 5-fluorouracil, and prednisolone at a dosage of 5 to 7.5 mg/m²/day.

Children: Leukeran may be used in the management of Hodgkin's disease and non-Hodgkin's lymphomas in children. The dosage regimens are similar to those used in adults.

Contra-indications, warnings, etc

Contra-indications: In view of the seriousness of the indications there are no absolute contra-indications.

Precautions: Leukeran is an active cytotoxic agent; use only under the direction of physicians experienced in the administration of such agents.

Since Leukeran is capable of producing irreversible bone marrow suppression, blood counts should be closely monitored in patients under treatment.

At therapeutic dosage Leukeran depresses lymphocytes and has less effect on neutrophils and platelet counts and on haemoglobin levels. Discontinuation of Leukeran is not necessary at the first sign of a fall in neutrophils but it must be remembered that the fall may continue for 10 days or more after the last dose.

Leukeran should not be given to patients who have recently undergone radiotherapy or received other cytotoxic agents.

of the bone marrow is myeloplastic, the daily dose is reduced to 25 mg.

As with other cytotoxic drugs, it is teratogenic. The use of it is never possible during the first trimester. In any case, the foetus must be protected. It should not be breast fed.

Dosage: Reversible pancytopenia, inadvertent overdoses ranging from agitated

behaviour and ataxia to multiple grand mal seizures has also occurred. As there is no known antidote the blood picture should be closely monitored and general supportive measures should be instituted, together with appropriate blood transfusion if necessary.

Pharmaceutical precautions Store at 2–8°C in a dry place.

Legal category POM.

Package quantities 2 mg: Bottle of 25 tablets. 5 mg: Bottle of 25 tablets.

Further information Leukeran has the pharmacological properties of the nitrogen mustard compounds. The drug is only partly radiomimetic, affecting chiefly the lymphoid tissues. Experimental studies have shown that chlorambucil is well absorbed and well tolerated by the oral route.

Tablets 5 mg 0003/5265

LINCTIFED* EXPECTORANT

LINCTIFED* EXPECTORANT PAEDIATRIC

Presentation Linctified Expectorant contains:

Tripolidine Hydrochloride BP	1.25 mg
Pseudoephedrine Hydrochloride BP	20 mg
Codeine Phosphate BP	7.5 mg
Guaiphenesin BP	100 mg

in each 5 ml of orange-coloured syrup. It has an aromatic flavour.

Linctified Expectorant Paediatric contains:

Tripolidine Hydrochloride BP	0.6 mg
Pseudoephedrine Hydrochloride BP	12 mg
Codeine Phosphate BP	3 mg
Guaiphenesin BP	50 mg

in each 5 ml of red-coloured syrup. It has a sweet, fruity flavour.

Uses Expectorant.

To aid expectoration in bronchitis and other conditions where tenacious mucoid secretions are a problem.

Dosage and administration *Linctified Expectorant:*

Adults: 10 ml three times a day.

Children: Over 12 years: 10 ml three times a day.

Under 12 years: Linctified Expectorant Paediatric is recommended.

Linctified Expectorant Paediatric: Children: 6–12 years: 10 ml three times a day.

1–6 years: 5 ml three times a day.

May be diluted with Syrup BP.

Pharmacology: Pseudoephedrine has direct and indirect sympathomimetic activity and is an orally effective upper respiratory tract decongestant. Pseudoephedrine is substantially less potent than ephedrine in producing both tachycardia and elevation in systolic blood pressure and considerably less potent in causing stimulation of the central nervous system. On the basis of widespread and long established clinical use, guaiphenesin is recognised as an expectorant in bronchitis. Tripolidine provides antihistamine activity by antagonising H₁ receptors whilst codeine provides analgesic and antitussive actions, decreasing cough frequency but not totally suppressing it.

Contra-indications, warnings, etc

Contra-indications: Contra-indicated in patients with known hypersensitivity to any of the constituents.

Contra-indicated in persons under treatment with monoamine oxidase inhibitors and within two weeks of stopping such treatment.

Precautions: Although pseudoephedrine causes virtually no pressor effect in patients with normal blood pressure, Linctifed should be used with caution in patients with cardiovascular disorders, including hypertension. The effect of antihypertensive agents which modify sympathetic activity may be partially reversed by Linctifed.

Caution should also be exercised in patients taking other sympathomimetic agents, such as decongestants, appetite suppressants and amphetamine-like psychostimulants. The effects of a single dose on the blood pressure of these patients should be observed before recommending repeated or unsupervised treatment.

As with other sympathomimetic agents, caution should be exercised in patients with prostatic enlargement or bladder dysfunction.

In severe hepatic or renal dysfunction a single dose of Linctifed Expectorant or Linctifed Expectorant Paediatric should be given initially and the response to it used as a guide to the patient's requirement for further administration of the product.

The antibacterial agent furazolidone is known to cause a progressive inhibition of monoamine oxidase and although there are no reports of hypertensive crises having occurred, it should not be administered concurrently with Linctifed Expectorant or Linctifed Expectorant Paediatric.

May cause drowsiness. Patients should not drive a vehicle or operate machinery until they have determined their own response. In some patients the drowsiness induced by antihistamines may be potentiated by alcohol or other central sedatives.

Use in pregnancy and lactation: No data are available on the use of Linctifed Expectorant during pregnancy nor on the excretion of it or its metabolites in human milk.

Toxicity and treatment of overdose: Probable symptoms include drowsiness, inco-ordination, weakness, palpitation, irritability, hypertension, convulsions and difficulty in micturition. In severe cases there may be respiratory depression due to the codeine component. Gastric lavage and supportive measures for respiration and circulation should be performed if indicated. Convulsions should be controlled with an anticonvulsant. Catheterisation of the bladder may be necessary. Alpha-adrenergic blockade may be required to treat hypertensive crises and beta-adrenergic blockade for the control of supra-ventricular dysrhythmias. Pseudoephedrine has a renal excretion half-life of approximately seven hours and if desired the elimination can be accelerated by acid diuresis or by dialysis.

Pharmaceutical precautions Store below 25°C. Protect from light.

Legal category P.

Package quantities *Linctifed Expectorant:* Bottles of 500 ml and 2 litres.

Linctifed Expectorant Paediatric: Bottles of 500 ml and 2 litres.

Further information Nil.

Expectorant 0003/5266

Expectorant Paediatric 0003/5267

MALOPRIM* TABLETS

Presentation *Tablets:* Each white tablet is scored a contains 12.5 mg Pyrimethamine BP and 100 mg Dapsone BP, coded Wellcome H9A.

Uses Maloprim is effective as a causal prophylactic and suppressive agent against malaria caused by *Plasmodium falciparum* and probably other malaria parasites notably *P. vivax*. Since potentiation takes place between its two active constituents Maloprim is recommended particularly when resistance to pyrimethamine or other anti-folate preparations is known or suspected. It is effective in chloroquine-resistant areas.

Note: Maloprim should not be used for treatment of acute attack.

Dosage and administration *Adults:* 1 tablet each week.

Children: Over 10 years: 1 tablet each week.

5-10 years: ½ tablet each week.

Under 5 years: Formulation not applicable.

The constituents are rapidly absorbed and prophylactic cover can be expected shortly after taking the first dose. Prophylaxis should commence before arrival in endemic area and be continued once weekly. On returning to a non-malarious area dosage should be maintained for a further four weeks.

Contra-indications, warnings, etc

Contra-indications: Maloprim should not be given to individuals with a known history of sensitivity to sulphonamides or sulphones or pyrimethamine.

Precautions: The recommended dose should not be exceeded.

Maloprim should be used with caution in patients with hepatic or renal disorders.

During pregnancy and in the presence of other conditions predisposing to folate deficiency a folic acid supplement should be given.

Maloprim, through its mode of action, may further depress folate metabolism in patients already receiving treatment with other folate inhibitors, including combinations of trimethoprim and sulphonamides.

Side- and adverse effects: No significant side-effects caused by Maloprim at recommended dosage have been reported apart from rare instances of cyanosis attributed to methaemoglobinemia.

Excessive doses over a prolonged period may produce megaloblastic or haemolytic anaemia.

Acute haemolysis may also occur in individuals with glucose-6-phosphate dehydrogenase deficiency.

Rare idiosyncratic reactions include agranulocytosis and skin sensitivity reactions.

Use in pregnancy and lactation: While there is theoretical risk of foetal malformation with all folate inhibitors given during pregnancy, no such adverse effects have been reported with Maloprim. A folic acid supplement should be given to pregnant women receiving Maloprim. The amount of the components of Maloprim excreted in breast milk is insufficient to contraindicate its use in lactating mothers.

Toxicity and treatment of overdose: Symptoms are likely to be nausea, vomiting, hyperexcitability, methaemoglobinemia and haemolytic anaemia. Convulsions may be apparent and megaloblastic anaemia may ensue. Gastric lavage, adequate fluids and general supportive measures are recommended. Maintenance of a clear

way and control of convulsions may be required. Division should be made for fresh blood transfusions. To counteract possible folate deficiency calcium folinate 15 mg daily should be administered. Methaemoglobinemia should be treated with ascorbic acid, 200 mg three times daily, or, except in patients with G-6-PD deficiency, by intravenous administration of methylene blue, 2 mg/kg body weight.

Pharmaceutical precautions Store below 25°C. Protect from light.

Legal category POM.

Package quantities Strip pack of 30 tablets.

Further information Nil.

Product licence number 0003/5117.

IGRIL* TABLETS

Presentation Migril Tablets each contain 2 mg Ergotamine Tartrate BP, 50 mg Cyclizine Hydrochloride BP and 100 mg Caffeine Hydrate BP. Scored and coded Wellcome A4A, Coloured white with pink core.

Uses For relief of the acute migraine attack.

Dosage and administration *Adults:* The usual initial dose is 1 or 2 tablets, which should be swallowed *at the start of an attack*. Half or 1 tablet at half-hourly intervals may then be given, but not more than 4 tablets could be taken for any single attack. The smallest effective dose should be used. Not more than 6 tablets could be taken in any one week.

Children: Not applicable.

Contra-indications, warnings, etc

Contra-indications: Migril should not be used for prophylaxis.

The contra-indications to Migril are the same as for ergotamine, i.e. peripheral vascular disease, coronary disease, kidney and liver diseases, thyrotoxicosis, anaemia and during pregnancy.

Precautions: In very rare cases and certain febrile conditions a patient may be unduly sensitive to ergotamine. Unexpected coldness in the extremities is a sign that the drug should be withdrawn.

Side- and adverse effects: Side-effects include abdominal pain or fatigue of the limbs.

Indiscriminate use of products containing ergotamine may precipitate, upon discontinuation of the drug, withdrawal symptoms amongst which headaches feature prominently.

Prolonged abuse of such products may lead to chronic ergotism.

In common with other antihistamines, cyclizine may cause sedation, although this is rarely marked. Patients should be cautioned, therefore, not to drive motor vehicles or operate machinery if drowsiness occurs.

Use in pregnancy and lactation: See Contra-indications section concerning pregnancy. It is wise for the mother to refrain from breast feeding whilst taking ergotamine preparations.

Toxicity and treatment of overdosage: Symptoms may comprise: excitement, weakness, pyrexia and vomiting with tremors and convulsions. Peripheral vasoconstriction and abdominal colic. Shivering and paraesthesia. Bradycardia and hypotension. Respiratory depression, hypoxia and coma.

Treatment of overdosage is by means of gastric lavage, amyl nitrite inhalations, general supportive measures.

Sodium nitroprusside may be given as an intravenous infusion (50–120 micrograms per min) to produce vasodilation.

Pharmaceutical precautions Store below 25°C in a dry place.

Legal category POM.

Package quantities Bottle of 100 tablets.

Further information The Migril combination not only relieves the pain, but also the nausea and vomiting which are part of the migraine syndrome.

Product licence number 0003/5114.

MYLERAN* TABLETS

Presentation *Myleran Tablets:* 0.5 mg Busulphan BP, coded Wellcome F2A. Coloured white with yellow core. 2.0 mg Busulphan BP, coded Wellcome K2A. Coloured white with yellow core.

Uses Cytotoxic agent. Myleran is indicated for the treatment of chronic granulocytic leukaemia. Myleran has been shown to be superior to splenic irradiation when judged by survival times, control of spleen size and maintenance of haemoglobin levels. Although not curative, Myleran reduces the total granulocyte mass, relieves symptoms of disease, and improves the clinical state of the patient. Myleran is not useful once blast transformation has occurred. Myleran is also effective in producing remission in polycythaemia vera. It is especially useful in cases resistant to radiophosphorous (32p) therapy and where there is marked thrombocytosis. Myleran may be useful in selected cases of essential thrombocythaemia and myelofibrosis.

Dosage and administration *Adults: Chronic Granulocytic Leukaemia: Remission induction:* The dosage is 0.06 mg/kg daily with a maximum daily dose of 4 mg which may be given as a single dose.

Administration of Myleran should be discontinued when the white blood cell count has fallen to between 20–25,000/cu mm or earlier if the platelet count falls below 100,000/cu mm otherwise there is a considerable risk of causing irreversible bone marrow aplasia since the counts may continue to fall for some time after treatment is stopped. The blood count should be monitored at least weekly during the induction phase and the dose should be increased only if the response after three weeks is inadequate.

Maintenance therapy: Although the white count may be controlled without further therapy for long periods after induction therapy, most clinicians use some form of maintenance treatment.

Dosage is usually between 0.5–2 mg per day but individual requirements may be much less. The aim is to maintain a white blood count of 10–15,000/cu mm and blood counts should be performed at least every four weeks.

Polycythaemia vera and essential thrombocythaemia: **Remission induction:** The dosage is 4–6 mg daily. The total dose required to produce remission varies so that very careful haematological control is essential. **Maintenance therapy:** The dosage is approximately half the induction dose but the exact amount must be assessed individually for each patient. Prolonged treatment is

necessary, requiring close supervision and frequent blood counts.

Myelofibrosis: The usual dosage is 2–4 mg per day, with a lower dose for maintenance. Very careful haematological control is required because of the great sensitivity of the bone marrow in this condition.

Children: Very rarely indicated.

Contra-indications, warnings, etc

Contra-indications: In view of the seriousness of the indications, there are no absolute contra-indications.

Precautions: Careful attention should be paid to the monitoring of blood counts to avoid the possibility of excessive myelosuppression and the risk of irreversible bone marrow aplasia.

The main side-effect of Myleran treatment is bone marrow depression, particularly thrombocytopenia. Special care must be taken when the initial platelet count is low and when the count falls during treatment. Administration of Myleran should be stopped immediately at any stage of treatment if there is a sharp fall in the platelet count or if purpura develops.

Myleran should not be given to patients who have recently received radiotherapy or other cytotoxic drugs.

Hyperuricaemia and/or hyperuricosuria are not uncommon in untreated patients with chronic granulocytic leukaemia and should be corrected before starting therapy with Myleran. During treatment hyperuricaemia and the risk of uric acid nephropathy should be prevented by adequate prophylaxis.

Various chromosome aberrations have been noted in cells from patients receiving Myleran. Widespread epithelial dysplasia has been reported.

The possibility that Myleran is carcinogenic should be borne in mind. A number of malignant tumours have been reported in patients receiving busulphan.

Ovarian suppression and amenorrhoea with menopausal symptoms commonly occur in pre-menopausal patients.

Busulphan interferes with spermatogenesis in experimental animals and there have been clinical reports of sterility, azoospermia and testicular atrophy in man.

Side- and adverse effects: The most common side-effect is bone marrow depression. Gastro-intestinal effects such as nausea, vomiting and diarrhoea have been reported rarely. Such intolerance is not a significant problem and can be controlled by giving the daily treatment in divided doses.

Hyperpigmentation is the most common skin reaction and occurs in 5–10% of patients, particularly those with a dark complexion. In a few cases a clinical syndrome resembling adrenal insufficiency and characterised by weakness, severe fatigue, anorexia, weight loss, nausea and vomiting, and hyperpigmentation of the skin has developed after prolonged busulphan therapy. The syndrome has sometimes resolved when busulphan has been withdrawn.

Diffuse pulmonary fibrosis with progressive dyspnoea and a persistent non-productive cough has occurred rarely, usually after prolonged treatment over a number of years. In a single case pulmonary ossification also occurred. The lung pathology may be complicated by superimposed infections. It is possible that subsequent radiotherapy can augment subclinical lung injury caused by Myleran. Lens changes, and cataracts which may be bilateral, have been reported during Myleran therapy.

Other reported adverse reactions include urticaria, erythema multiforme, erythema nodosum, alopecia, por-

phyria cutanea tarda, excessive dryness and fragility of the skin with complete anhidrosis, dryness of the or mucous membranes and cheilosis, gynaecomastia, cholestatic jaundice, endocardial fibrosis and myasthenia gravis. Most of these are single case reports and in many a clear cause and effect relationship with Myleran has not been demonstrated.

Use in pregnancy and lactation: Myleran is potential teratogenic and embryotoxic, although there have been a number of reported cases where apparently normal children have been born after busulphan treatment during pregnancy, Myleran should be avoided during pregnancy, particularly during the first trimester. In each case, the potential benefit to the mother must be weighed against the risk to the foetus.

Mothers receiving Myleran should not breast feed.

Toxicity and treatment of overdosage: The principal toxic effect is on the bone marrow. Survival after a single large dose has been reported but haematological toxicity is likely to be more profound with chronic overdosage. As there is no known antidote the blood picture should be closely monitored and general supportive measures together with appropriate blood transfusion, instituted necessary.

Pharmaceutical precautions Store below 25°C in dry place.

Legal category POM.

Package quantities 0.5 mg: Bottle of 25 tablets
2.0 mg: Bottle of 25 tablets.

Further information Myleran is more selective than nitrogen mustard or the folic acid antagonists in its effect on the myeloid cells and may be somewhat safer in use in certain patients have received daily doses of 4 mg for as long as a year.

Tablets 2.0 mg 0003/5112

PENTOSTAM* INJECTION

Presentation Pentostam is a sterile faintly straw coloured solution of Sodium Stibogluconate BP containing the equivalent of 100 mg pentavalent antimony per ml.

Uses Pentostam is indicated in the following infection caused by Leishmania organisms:

Visceral leishmaniasis (kala-azar)

Cutaneous leishmaniasis (oriental sore) – both dry and moist forms, but excluding diffuse leishmaniasis.

American muco-cutaneous leishmaniasis (espundia).

Dosage and administration *Visceral leishmaniasis (kala-azar):* Adults: 6 ml daily for 7–10 days by intramuscular or intravenous injection. Two or three further courses, separated by an interval of 10 days, may be necessary.

Children: 0.1 ml/kg body weight for 21 days or 0.2 ml/kg body weight for 12–14 days by intravenous or intramuscular injection up to a maximum of 6 ml in a day.

Inadequate treatment may lead to relapse. Therefore a full course of treatment should be given where possible. All patients should be re-examined regularly for two years after treatment.

Cutaneous leishmaniasis (oriental sore): The dosage

me outlined for visceral leishmaniasis is recommended. Alternatively Pentostam can be infiltrated and the edge of the lesions in a dosage of *not more* 12 ml at any one time.

co-cutaneous leishmaniasis (espundia): Improvement or complete resolution may occur after a course of 1 Pentostam daily for 10 days given intravenously or amulsularly. A similar course can be repeated, if necessary, on two occasions at monthly intervals.

travenous injections should be administered very slowly and discontinued immediately if coughing, vomiting, or substernal pain occurs. In such cases extreme care should be taken if Pentostam is readministered by route.

ntra-indications, warnings, etc

ntra-indications: Pentostam is contra-indicated in pneumonia, myocarditis, hepatitis and nephritis.

cautions: Very rarely anaphylactic shock may develop during treatment for which Adrenaline Injection BP and appropriate supportive measures should be given immediately.

accumulation of antimony in the cardiac conducting system may give rise to disturbances in cardiac rhythm. In such circumstances further treatment with Pentostam may be contra-indicated.

care should be taken in the administration of Pentostam to patients who have recently received other antimonial drugs.

Side- and adverse effects: Documented side-effects include anorexia, substernal pain, coughing, vomiting and weakness.

Use in pregnancy and lactation: Although no effects on the foetus have been reported, Pentostam should be withheld during pregnancy unless the potential benefits to the patient outweigh the possible risk to the foetus.

No information is available on the excretion of Pentostam in breast milk.

Toxicity and treatment of overdose: Main symptoms of antimony poisoning are gastro-intestinal disturbances (nausea, vomiting and severe diarrhoea). Haemorrhagic enteritis and hepatitis may also occur. After oral ingestion gastric lavage should be carried out.

There is only limited information on the use of chelating agents in the treatment of intoxication with antimony compounds. Dimercaprol has been reported to be active. A dose of 200 mg by intramuscular injection, every six hours until recovery is complete, is suggested.

Pharmaceutical precautions Store below 25°C and protect from light.

Pharmaceutical category POM.

Package quantities Rubber-capped bottle of 100 ml.

Further information Nil.

Product licence number 0003/5105.

PHYSEPTONE® INJECTION PHYSEPTONE® TABLETS PHYSEPTONE® LINCTUS

Presentation Physeptone Injection contains 10 mg methadone Hydrochloride BP in each ml.

Physeptone Tablets each contain 5 mg Methadone hydrochloride BP, scored, coded Wellcome L4A and white in colour.

Physeptone Linctus contains 2 mg Methadone Hydro-

chloride BP, in each 5 ml and is a clear orange-brown syrup.

Uses 1. **Analgesic:** In conditions where morphine would make a reasonable alternative, particularly for the relief of pain of visceral origin. It is not recommended for use in ambulant patients.

2. **Cough suppressant:** For the control of severe cough where diamorphine linctus would be a reasonable alternative.

Dosage and administration **Analgesic use: Adults:** Usual single dose 5–10 mg by mouth, subcutaneous or intramuscular injection.

Owing to its long plasma half-life caution with repeated dosage should be observed in the very ill or elderly. The usual initial dose should be 5–10 mg, 6–8 hourly, later adjusted to the degree of pain relief obtained.

Children: Not suitable.

Anti-tussive use: Adults: 5 ml every 3–4 hours.

Children: Dilute 1 volume of linctus with 7 volumes Syrup BP. Doses of diluted preparation are:

Children over 10 years: 10 ml every 4 hours.

Children under 10 years: 5 ml every 4 hours.

Where the drug is given by mouth for the control of pain associated with a chronic condition it is wise to restrict the dose to the smallest amount which adequately controls the symptoms.

Physeptone has less hypnotic effect than morphine.

If it is necessary to give a patient a potent analgesic for a prolonged period, some increase in dose may be found necessary; in such circumstances it is probably sound practice to change to another drug (codeine, morphine, pethidine) for a time. Physeptone may then be resumed in diminished doses.

Contra-indications, warnings, etc

Contra-indications: Respiratory depression, obstructive airways disease. Concurrent administration with monoamine oxidase inhibitors, or within 2 weeks of discontinuation of treatment with them. Obstetric use is not recommended.

Precautions: Children are very sensitive to the depressant effects.

The possibility of addiction cannot be excluded and patients should be reminded of the necessity of adhering to the prescribed dosage.

Side- and adverse effects: Euphoria, dizziness, drowsiness, vomiting or nausea, and respiratory depression may occur in some patients. In rare cases a hypersensitive subject may react with a sudden transient fall in blood pressure; this is short-lived and self-terminating. Side-effects are more common and more severe in ambulant patients. Nausea and vomiting appear to be more frequent after oral administration than after injection.

In known drug addicts, Physeptone has produced withdrawal symptoms but these are mild. Tolerance and dependence of the morphine type may occur.

Use in pregnancy and lactation: There is no, or inadequate, evidence of safety in human pregnancy but the drug has been widely used for many years without apparent ill-consequence and animal studies have not shown any hazard. From theoretical considerations methadone is likely to be excreted in breast milk.

Toxicity and treatment of overdose: Toxic doses of methadone cause unconsciousness, pin-point pupils, slow, shallow respiration, cyanosis and weak pulse. Often there is a 2–3 hour delay between ingestion and

the appearance of symptoms. Lavage, dialysis and CNS stimulation are contra-indicated. Intravenous naloxone should be given and repeated at 5–10 minute intervals to attain full benefit.

Acidification of the urine will increase the rate of elimination of the drug via the kidney.

Pharmaceutical precautions *Tablets:* Store below 25°C.

Linctus: Store below 25°C, protect from light.

Injection: Store below 25°C, protect from light.

Physeptone Linctus may be diluted with Syrup BP.

Legal category POM, MDA.

Package quantities *Physeptone Injection:* 10 mg in 1 ml ampoules. Boxes of 5 and 100 ampoules.

Physeptone Tablets: Bottle of 100 tablets.

Physeptone Linctus: Bottle of 500 ml.

Further information Nil.

Linctus 0003/5232

POLIOMYELITIS VACCINE, LIVE (ORAL) BP WELLCOME® TRIVALENT (SABIN TYPE, MONKEY KIDNEY CELL CULTURE) (Pol/Vac (Oral))

Presentation This vaccine is a stabilised sterile aqueous suspension of suitable live attenuated strains of poliomyelitis virus, types 1, 2 and 3, grown in cultures of monkey kidney tissue cells.

The attenuated vaccine strain of each type of poliovirus has antibody-inducing characteristics similar to its virulent counterpart. Extensive studies have shown that there is little risk of Sabin attenuated virus reverting to a virulent condition.

The vaccine may vary in colour from clear to light pink.

Use For active immunisation against poliomyelitis.

Dosage and administration *Dosage: Adults and children:* Three drops constitute one dose. The primary course consists of three doses of poliomyelitis vaccine at intervals of not less than four weeks.

Administration: For oral use only. The container should be shaken. To ensure the correct drop size is obtained, the container should be held vertically with the nozzle pointing downwards. Although between batches of containers the drop size, and hence the fill volume, may vary, the virus dose provided remains constant.

In the United Kingdom, oral polio vaccine is usually given in infancy at the same time as routine immunisation against diphtheria, tetanus and pertussis. Thereafter it is recommended that all immunised children be given a single reinforcing dose of oral poliomyelitis vaccine at school entry at the time they receive their reinforcing dose of diphtheria/tetanus vaccine, and again at 15 to 19 years of age or on leaving school. Further reinforcing doses are given to adults if they are likely to be exposed to special risk of contracting the disease.

Administration of oral poliomyelitis vaccine induces circulating antibodies and local antibody responses in the intestine. However, one type of poliovirus in the vaccine may inhibit another from establishing immunity.

Thus, when only a single dose of trivalent oral p vaccine is given successful immunisation against three types of poliovirus may not occur. Therefore in primary course the vaccine is administered on at least three occasions to ensure that each type of vaccine poliovirus is given an opportunity of establishing immunity. Record the title, dose and lot numbers of all vaccine and the date administered.

Contra-indications, warnings, etc

Contra-indications: Oral poliomyelitis vaccine may contain up to 4.5 i.u. of polymyxin, 0.06 i.u. of neomycin, 3.7 mcg kanamycin, 0.004 i.u. penicillin and 3.7 n streptomycin per dose. Patients with an established hypersensitivity to any of these antibiotics should not be vaccinated. In arriving at a decision to withhold administration of vaccine in an individual case, the vaccinating physician should decide whether the hazards of a hypersensitivity reaction outweigh the benefits of vaccination.

The efficacy of the vaccine may be impaired if given while the subject has diarrhoea or vomiting. In combination with other live vaccines, it should not be administered to subjects with an acute febrile illness or impaired immune responsiveness whether idiopathic, or as a result of treatment with steroids, radiotherapy, cytotoxic drugs or other agents.

Vaccinees, parents and other household contacts should be made aware of the possible risk of recipient and contact paralysis prior to vaccination.

Side- and adverse effects: Vaccine-related paralysis in recipients or contacts may occur on very rare occasions.

Use in pregnancy and lactation: The vaccine should not be administered to pregnant women, unless they are known to be at an increased risk of contracting poliomyelitis.

Toxicity and treatment of overdosage: Not applicable.

Pharmaceutical precautions If stored between 2 and 4°C oral poliomyelitis vaccine can be expected to retain its potency for six months. If stored at or just below 25°C, oral poliomyelitis vaccine can be expected to retain its potency for one week. When tubes of vaccine have been opened there is a risk of contamination with bacteria and moulds which may result in a reduction of vaccine potency. It is good practice, therefore, to discard vaccine remaining in opened tubes at the end of the vaccinating session.

Legal category POM.

Package quantities Polythene dropper tubes of 10 doses.

Product licence number 0003/5270.

POLYTRIM® EYE DROPS

Presentation A clear, colourless, sterile, aqueous solution containing in each ml: Trimethoprim BP 10 mg, Polymyxin B Sulphate BP 10,000 units, Thiomersal F (0.05 mg per ml) is included as a preservative.

Uses Antibacterial agent. For the treatment of a prophylaxis of external bacterial infections of the eye including conjunctivitis, keratitis, corneal ulcerative ulcerative blepharitis with associated conjunctivitis, acute chronic dacryocystitis. Prophylactically, it is used following removal of foreign bodies, and before and after ophthalmic surgery to help provide and maintain a sterile field.

sage and administration *Adults:* 1 drop in the affected eye four times daily. *Children:* As for adults. More frequent administration may be required, depending on the severity of the condition. Treatment should normally be continued for at least forty-eight hours after the eye has apparently returned to normal.

Contra-indications, warnings, etc

Contra-indications: Contra-indicated in individuals who have a history of hypersensitivity to trimethoprim or to polymyxins.

cautions: As with all antibacterial preparations, prolonged use may result in the overgrowth of non-susceptible organisms including fungi.

e- and adverse effects: Polyttrim is isotonic with tears and is well tolerated in the eye. No local adverse effects are to be expected, except rarely, a hypersensitivity reaction. If one is suspected during treatment, administration should be discontinued.

Toxicity and treatment of overdosage: Not applicable.

Pharmaceutical precautions Do not use if the container seal has been broken. Use within one month of opening container. Store in a dry place, below 25°C, and protect from light. Not suitable for injection.

Legal category POM.

Package quantities Screw-capped plastic dropper bottle containing 5 ml.

Further information There is *in vitro* evidence of synergy between trimethoprim and polymyxin. The combination is effective against a wide variety of Gram-positive and Gram-negative bacterial ocular pathogens, including *Pseudomonas aeruginosa*.

Product licence number 0003/0153.

IO-ACTIDIL* TABLETS

Presentation Each tablet contains 10 mg of Triprolidine Hydrochloride BP divided between three layers to give a rapid onset of action, followed by a sustained release of the drug to give a therapeutic effect lasting up to 24 hours in most patients. Each tablet is coded with Wellcome M4A and is white with blue core and pink outer layer.

Uses Prolonged action antihistamine.

In allergic dermatoses, urticaria, seborrhoeic eczema, allergic rhinitis, conjunctivitis, vasomotor rhinitis, hay fever, particularly nocturnal and early morning attacks.

Dosage and administration *Adults:* 1 tablet swallowed whole with a little water in the early evening, or 1 to 2 tablets before retiring. A few patients with very severe symptoms may need two tablets during 24 hours.

Children: Over 10 years: 1 tablet a day.

Under 10 years: It is recommended that Actidil Elixir is used.

Contra-indications, warnings, etc

Contra-indications: Contra-indicated in patients with known hypersensitivity to triprolidine.

Precautions: Caution in severe hepatic or renal dysfunction.

May cause drowsiness. Patients should not drive a vehicle or operate machinery until they have determined their own response. In some patients the drowsiness

induced by antihistamines may be potentiated by alcohol or other central sedatives.

Side- and adverse effects: Triprolidine may cause drowsiness. Lichenoid skin eruptions due to triprolidine have rarely been reported.

Use in pregnancy and lactation: No data are available on the use of Pro-Actidil in human pregnancy nor on the excretion of it or its metabolites in human milk.

Toxicity and treatment of overdosage: Drowsiness, dizziness, inco-ordination, weakness, convulsions and respiratory depression may occur.

Necessary measures should be taken to maintain and support respiration. Gastric lavage should be performed if indicated and convulsions controlled with diazepam. There are theoretical grounds for believing that the elimination of triprolidine and its metabolites could be accelerated by dialysis.

Pharmaceutical precautions Store below 15°C.

Legal category P.

Package quantities Bottle of 100 tablets.

Further information Nil.

Product licence number 0003/5228.

PURI-NETHOL* TABLETS

Presentation Each tablet contains 50 mg Mercaptopurine BP, fawn coloured, scored and coded Wellcome 04A.

Uses Cytotoxic agent.

Puri-Nethol is indicated for the treatment of acute leukaemia. It is of value in remission induction and is particularly indicated for maintenance therapy in acute lymphoblastic leukaemia and acute myelogenous leukaemia. Puri-Nethol is used in the treatment of chronic granulocytic leukaemia.

Dosage and administration For adults and children the usual dose is 2.5 mg/kg bodyweight per day, but the dose and duration of administration depend on the nature and dosage of other cytotoxic agents given in conjunction with Puri-Nethol. The dosage should be carefully adjusted to suit the individual patient. Puri-Nethol has been used in various combination therapy schedules for acute leukaemia and the literature should be consulted for details. Consideration should be given to reducing the dosage in patients with impaired hepatic or renal function. When Zyloric (Allopurinol) and Mercaptopurine are administered concomitantly it is essential that only a quarter of the usual dose of Mercaptopurine is given since Zyloric (Allopurinol) decreases the rate of catabolism of Mercaptopurine.

Contra-indications, warnings, etc

Contra-indications: In view of the seriousness of the indications there are no absolute contra-indications.

Precautions: Puri-Nethol is an active cytotoxic agent for use only under the direction of physicians experienced in the administration of such agents.

Since Puri-Nethol is strongly myelosuppressive full blood counts must be taken daily during remission induction. Patients must be carefully monitored during therapy.

Treatment with Puri-Nethol causes bone marrow suppression leading to leucopenia and thrombocytopenia.

The leucocyte and platelet counts continue to fall after treatment is stopped, so at the first sign of an abnormally large fall in the counts, treatment should be interrupted immediately.

Bone marrow suppression is reversible if Puri-Nethol is withdrawn early enough.

During remission induction in acute myelogenous leukaemia the patient may frequently have to survive a period of relative bone marrow aplasia and it is important that adequate supportive facilities are available.

Puri-Nethol is hepatotoxic and liver function tests should be monitored weekly during treatment. More frequent monitoring may be advisable in those with pre-existing liver disease or receiving other potentially hepatotoxic therapy. The patient should be instructed to discontinue Puri-Nethol immediately if jaundice becomes apparent.

During remission induction when rapid cell lysis is occurring, uric acid levels in blood and urine should be monitored as hyperuricaemia and/or hyperuricosuria may develop, with the risk of uric acid nephropathy.

Puri-Nethol in common with other antimetabolites is potentially mutagenic and chromosome damage has been reported in rats and man.

In view of its action on cellular deoxyribonucleic acid (DNA) mercaptopurine is potentially carcinogenic and consideration should be given to the theoretical risk of carcinogenesis with this treatment.

When Zyloric [allopurinol] and Puri-Nethol are administered concomitantly it is essential that only a quarter of the usual dose of Puri-Nethol is given since Zyloric decreases the rate of catabolism of Puri-Nethol.

Inhibition of the anticoagulant effect of warfarin, when given with Puri-Nethol, has been reported.

It is advised that care be taken when handling or inhaling these tablets not to contaminate hands or to inspire drug.

Side- and adverse effects: The main side-effect of treatment with Puri-Nethol is bone marrow suppression leading to leucopenia and thrombocytopenia. Puri-Nethol is hepatotoxic in animals and man. The histological findings in man have shown hepatic necrosis and biliary stasis. The incidence of hepatotoxicity varies considerably and can occur with any dose but more frequently when the recommended dose of 2.5 mg/kg bodyweight daily is exceeded. Monitoring of liver function tests may allow early detection of liver toxicity. This is usually reversible if Puri-Nethol therapy is stopped soon enough. However, irreversible liver damage leading to a fatal outcome has occurred.

Anorexia, nausea and vomiting have occasionally been noted.

Oral ulceration has been reported during Puri-Nethol therapy and rarely intestinal ulceration has occurred.

Rare complications are drug fever and skin rash.

Use in pregnancy and lactation: Puri-Nethol is embryotoxic in rats. This effect is dose dependent.

Normal offspring have been born after Puri-Nethol therapy during human pregnancy, but abortion, prematurity and malformation have been reported. The small numbers involved do not allow an evaluation of the degree of risk of Puri-Nethol therapy during pregnancy and the possible hazard to the foetus must be balanced against the expected benefit in individual cases.

Mothers receiving Puri-Nethol should not breast feed.

Toxicity and treatment of overdosage: The principal toxic effect is on the bone marrow and haematological toxicity is likely to be more profound with chronic overdosage

than with a single ingestion of Puri-Nethol. The risk of overdosage is also increased when Zyloric is being given concomitantly with Puri-Nethol. As there is no known antidote the blood picture should be closely monitored and general supportive measures, together with appropriate blood transfusion, instituted if necessary.

Pharmaceutical precautions Store below 2°C. Keep dry, protect from light.

Legal category POM.

Package quantities Bottle of 25 tablets.

Further information Puri-nethol is an analogue of adenine and hypoxanthine, and microbiological studies have shown it to be an antagonist of these; its mode of action differs thus from that of the folic acid antagonist.

Product licence number 0003/5227.

SCHICK TEST TOXIN BP AND SCHICK CONTROL BP WELLCOME*

Presentation Schick Test Toxin is the sterile dilute filtrate from a culture of *Corynebacterium diphtheriae*. The Control Fluid is the same material heated sufficiently to inactivate the toxin but not sufficiently to destroy more heat-stable bacterial proteins and their constituents.

Uses The Schick test is used to demonstrate whether or not a certain degree of immunity to diphtheria is present, either initially or after immunisation. The test produces a local skin reaction in those who are susceptible to the disease, while in those who are satisfactorily immune it is neutralised by the subject's antitoxin and no reaction results. The concurrent injection of Control Fluid at another, comparable site provides a means of distinguishing between true, positive reactions due to toxin and other reactions of an allergic nature due to non-specific constituents. During the first few months of life babies usually have maternally derived immunity. Those between 6 months and 8 years rarely suffer from untoward reactions after primary immunisation. Therefore, the Schick test is not usually given to infants or children up to 8 or even 10 years of age. In children over 10 years and adults, the state of immunity varies, so a preliminary Schick test should always be performed before injection of a vaccine, the main purpose being to detect those giving a negative and pseudo reaction, for they may experience a reaction after a dose of vaccine.

Dosage and administration *Technique:* A dose of 0.2 ml of the Toxin is injected intradermally into the anterior surface of the left forearm, and 0.2 ml of the Control Fluid into the corresponding position on the right forearm.

Separate syringes and needles should be used for the Toxin and Control Fluid. It is a practical advantage, when dealing with groups of subjects, to identify each syringe with a rubber band around the barrels of, say, those for the Control Fluid is suggested. Any unused portion of the container should be discarded.

Readings: Results may be read at 24-48 (possibly up to 72) hours, and again at five to seven days to detect late reactions and to reconsider earlier, doubtful readings. When comparing the appearance of the two arms it is possible to judge how far any reaction is due to the toxin and how

to the other constituents. Four types of result may be seen:

Negative (= immune). No reaction visible on either arm.

Negative-and-pseudo (= immune). Both arms show somewhat similar flushes which usually fade more rapidly than that of a true positive reaction. They are due to non-specific constituents and not to toxin.

Positive (= susceptible). The left arm shows a flush 10–50 mm in diameter; this fades and becomes brown and fine desquamation may occur. The staining persists for several weeks.

Positive-and-pseudo (= susceptible) (also called 'combined'). Both arms show a flush but the left is larger, deeper and more persistent than the right. The pseudo reaction develops more rapidly than any positive response and may be at its maximum at 24–72 hours. By the fifth sixth day, the pseudo effect has faded considerably or disappeared, whereas the positive reaction has increased in size and intensity.

Distinction must be made between those with a well-marked pseudo reaction, which may be slightly greater on the left arm, and those with a positive-and-pseudo reaction, which will be markedly greater on the left arm. The true positive-and-pseudo reaction is extremely rare in most subjects showing a large flush on both arms is immune, even if there is some difference between the two arms. Persons showing a well-marked pseudo reaction are almost invariably immune to diphtheria and could not be immunised further because they may react adversely to the vaccine.

The Schick test may be vitiated by the following: the timing of Schick tests performed from 12 hours before to four weeks after the administration of diphtheria, tetanus or of any other equine antitoxin or of convalescent human serum or gammaglobulin may be erroneous and should, if negative, be disregarded.

Contra-indications, warnings, etc

Contra-indications: Subjects with a history of hypersensitivity to previous doses of Schick Test materials or with known hypersensitivity to diphtheria vaccine should not be tested.

Precautions: Although anaphylaxis associated with the Schick Test is extremely rare, facilities for the management of anaphylaxis should be available during its administration.

The validity of the Schick Test may be impaired if the test is performed within 12 hours to 4 weeks following administration of any equine antitoxin or of human serum or gamma globulin. Negative results obtained during this period are not indicative of immunity to diphtheria and should be disregarded.

Use in pregnancy and lactation: The vaccine has been widely used for many years without apparent ill consequence.

Toxicity and treatment of overdose: Not applicable.

Pharmaceutical precautions Store at 2–8°C. Do not freeze.

Pharmaceutical category POM.

Package quantities Set of 1 ml.

Further information Nil.

Product licence number 0003/5139.

SEPTRIN® TABLETS SEPTRIN® DISPERSIBLE TABLETS SEPTRIN® FORTE TABLETS SEPTRIN® ADULT SUSPENSION SEPTRIN® PAEDIATRIC SUSPENSION SEPTRIN® PAEDIATRIC TABLETS

Presentation Septrin Tablets (Co-trimoxazole Tablets BP) each contain 80 mg Trimethoprim BP and 400 mg Sulphamethoxazole BP. Coded Septrin Y2B Wellcome. White in colour.

Septrin Dispersible Tablets (Dispersible Co-trimoxazole Tablets BP) each contain 80 mg Trimethoprim BP and 400 mg Sulphamethoxazole BP. Coded Septrin Y2B Wellcome. Orange in colour.

Septrin Forte Tablets (Co-trimoxazole Tablets BP) each contain 160 mg Trimethoprim BP and 800 mg Sulphamethoxazole BP. Scored and coded Septrin Forte O2C. White in colour.

Septrin Adult Suspension (Co-trimoxazole Mixture BP) contains 80 mg Trimethoprim BP and 400 mg Sulphamethoxazole BP in each 5 ml. Off-white in colour.

Septrin Paediatric Suspension (Paediatric Co-trimoxazole Mixture BP) contains 40 mg Trimethoprim BP and 200 mg Sulphamethoxazole BP in each 5 ml. Pale pink in colour.

Septrin Paediatric Tablets (Paediatric Co-trimoxazole Tablets BP) each contain 20 mg Trimethoprim BP and 100 mg Sulphamethoxazole BP. Scored and coded Wellcome H4B. White in colour.

Uses Antibacterial agent. Septrin is effective *in vitro* against a wide range of Gram-positive and Gram-negative organisms. It is not active against *Mycobacterium tuberculosis*, *Mycoplasma* or *Treponema pallidum*, *Pseudomonas aeruginosa* is usually insensitive.

Septrin is of value in the treatment of the following:

Respiratory tract: Acute and chronic bronchitis, bronchiectasis, lobar and broncho-pneumonia, *Pneumocystis carinii* pneumonitis, otitis media and sinusitis.

Genito-urinary tract: Urethritis, cystitis, pyelitis, pyelonephritis, and prostatitis. Male and female gonorrhoea.

Gastro-intestinal tract: Typhoid and paratyphoid fevers, chronic carriage of *Salmonella typhi* and *paratyphi*, cholera and shigellosis.

Skin infections: Pyoderma, abscesses and wound infections.

Other bacterial infections: Acute and chronic osteomyelitis, acute brucellosis, septicaemias and other infections caused by sensitive organisms.

Dosage and administration *Septrin Tablets* and *Septrin Dispersible Tablets – Adults:* Standard dosage: 2 twice daily.

For severe infections: 3 twice daily. For long-term treatment (more than 14 days): 1 twice daily.

Children over 12 years: As for adults.

6–12 years: 1 twice daily.

Septrin Dispersible Tablets should be taken in a little water or swallowed whole.

Septrin Forte Tablets – Adults: Standard dosage: 1 twice daily.

For severe infections: 1½ twice daily.

Children over 12 years: As for adults.

Children under 12 years: Not applicable.

Septrin Adult Suspension – Adults: Standard dosage: 10 ml twice daily.

For severe infections: 15 ml twice daily. For long-term treatment (more than 14 days): 5 ml twice daily.

Children over 12 years: As for adults.

Septrin Paediatric Suspension

Children 6–12 years: 10 ml twice daily.

6 months to 6 years: 5 ml twice daily.

6 weeks to 6 months: 2.5 ml twice daily.

Septrin Adult and Paediatric Suspensions may be diluted with Syrup BP.

Septrin Paediatric Tablets

Children 6–12 years: 4 twice daily.

2–6 years: 2 twice daily.

In acute infections, Septrin should be given for at least five days or until the patient has been symptom-free for two days.

In prostatitis and acute brucellosis, treatment at standard dosage should last for a period of at least four weeks.

Dosage in gonorrhoea: In uncomplicated gonorrhoea, 4 tablets every 12 hours for two days, or 5 tablets followed eight hours later by a further dose of 5 tablets, is recommended.

*Dosage in *Pneumocystis carinii* pneumonitis:* 20 mg trimethoprim, 100 mg sulphamethoxazole/kg/day in two divided doses for two weeks.

Dosage recommendations in renal impairment: If Septrin is given to patients with renal impairment then the following dosage scheme is suggested (no information is available for children with renal failure).

<i>Creatinine clearance (ml/min)</i>	<i>Serum creatinine (μmol/l)</i>	<i>Dosage</i>
Above 25	men < 265 women < 175	Standard dosage.
15–25	men 265–620 women 175–400	Standard dosage for a maximum of three days followed by half the standard dosage.
Below 15	men > 620 women > 400	Not to be administered unless haemodialysis facilities are available. Under this condition half the standard dosage may be given.

Measurements of plasma concentrations of sulphamethoxazole at intervals of two to three days are recommended in samples obtained 12 hours after administration of Septrin. If the concentration of total sulphamethoxazole exceeds 150 mcg/ml, then treatment should be interrupted until the value falls below 120 mcg/ml.

Contra-indications, warnings, etc

Contra-indications: Septrin should not be given to patients with a history of sulphonamide, trimethoprim or co-trimoxazole hypersensitivity.

Contra-indicated in patients showing marked liver parenchymal damage.

Except in certain circumstances it should not be given to patients with serious haematological disorders. The combination has been administered to patients receiving cytotoxic agents without evidence of an adverse effect on the bone marrow or peripheral blood.

Contra-indicated in severe renal insufficiency where

repeated measurements of the plasma concentration cannot be performed.

Septrin should not be given to premature babies nor full-term infants during the first six weeks of life. The drug should not be given during pregnancy. (See below)

Precautions: In cases with renal impairment a modified dosage schedule as described above is indicated. In such patients, measurements of the plasma concentration of the drug is advisable, and an adequate urinary output should be maintained.

A folate supplement should be considered when treating potentially folate deficient patients.

If Septrin treatment is prolonged, especially in patients with suspected impairment of folate metabolism, it is suggested that complete blood counts including thrombocytes be performed at monthly intervals.

The usual caution in prescribing any drug for women of child-bearing age should be exercised with Septrin.

Care should be taken when giving Septrin to patients receiving sulphonylurea hypoglycaemics, oral anticoagulants of the coumarin group or phenytoin as the action of these agents may be increased.

Patients receiving pyrimethamine in doses in excess of 25 mg weekly who are also receiving Septrin should have their blood pictures monitored because of the occasional report of megaloblastic anaemia apparently occurring in these circumstances.

Side- and adverse effects: Nausea, vomiting, diarrhoea, glossitis and skin rashes can occur. Pseudomembranous colitis has been reported rarely. Isolated cases of severe skin sensitivity reactions such as erythema multiforme, bullous (Stevens-Johnson syndrome) and toxic epidermal necrolysis (Lyell syndrome) have occurred.

As Septrin contains a sulphonamide, the possibility of blood dyscrasias like those associated with sulphonamides should be borne in mind. The changes reported with Septrin mainly consist of thrombocytopenia, purpura, leucopenia, neutropenia and very rarely agranulocytosis. They have usually proved to be reversible on withdrawal of the drug. Elderly patients are more susceptible to the blood changes. Septrin may induce haemolysis in certain susceptible glucose-6-phosphate dehydrogenase deficient patients.

There have been a few reports of subjective experiences such as headache, depression, dizziness or hallucinations but their relationship to therapy remain unproven.

During long-term therapy, isolated cases of megaloblastic changes in the bone marrow have been reported; these are reversible by folic acid therapy.

Use in pregnancy and lactation: The safety of Septrin in human pregnancy has not been established. Animal studies have shown teratogenic effects typical of a folate antagonist in rats but not rabbits at high doses; these were prevented by administration of dietary folate. Sulphonamide-containing products should not be administered in late pregnancy because of the risk of kernicterus.

Both sulphamethoxazole and trimethoprim may be found in breast milk but this does not contra-indicate the use of Septrin in lactating mothers.

Toxicity and treatment of overdose: Symptoms of acute overdose are likely to be nausea, vomiting, abdominal pain, dizziness and confusion. Treatment should consist of gastric lavage if within an hour of ingestion. Increased fluid intake will increase the elimination of sulphamethoxazole. Alkalinisation of the urine will also increase the elimination of sulphamethoxazole.

decrease that the trimethoprim. Calcium folinate 3–10 mg given orally or intramuscularly for five to seven days should counteract any bone-marrow effects of trimethoprim. General supportive measures are recommended.

Pharmaceutical precautions *Tablets*: Store below 25°C. Protect from light.

Injectable Tablets: Store below 25°C. Keep dry, protect from light.

Adult and Paediatric Suspension: Store below 25°C. Protect from light.

Legal category POM.

Package quantities *Septirin Tablets*: packs of 100 and 500 tablets.

Septirin Dispersible Tablets: packs of 100 and 500 tablets.

Septirin Forte Tablets: pack of 100 tablets.

Septirin Adult Suspension: bottle of 100 ml.

Septirin Paediatric Suspension: bottle of 100 ml.

Septirin Paediatric Tablets: pack of 100 tablets.

Further information Absorption by the oral route is rapid; significant plasma levels are obtained within an hour. Peak levels are reached between two and four hours and are maintained over a period of 12 hours.

In the treatment of tonsillo-pharyngitis due to Group A beta-haemolytic streptococci, eradication of these organisms from the oro-pharynx is less rapid than with many other antibiotics.

Trimethoprim may cause an apparent rise in serum creatinine levels due to (a) competition for the tubular resecretory mechanisms; (b) chemical interference with a visual auto-analyser method of estimating creatinine. Co-trimoxazole may cause a fall in peripheral thyroid hormone levels but the clinical significance requires confirmation.

Septirin for Infusion and Septirin Intra-muscular Injection are also available.

SEPTIRIN* FOR INFUSION

Strong Sterile Co-trimoxazole Solution
to make Co-trimoxazole Intravenous Infusion BP.

Presentation Septirin for Infusion contains 80 mg trimethoprim BP and 400 mg Sulphamethoxazole BP in each 5 ml ampoule. The infusion is faintly yellow and contains 40 per cent propylene glycol together with nyl alcohol and a small amount of benzyl alcohol. It has a pH of approximately 10.

Uses Antibacterial agent. Septirin is effective *in vitro* against a wide range of Gram-positive and Gram-negative organisms. It is not active against *Mycobacterium tuberculosis*, *Mycoplasma* or *Trachomatis pallidum*. *Pseudomonas aeruginosa* is usually insensitive.

In general, the indications for the use of Septirin for infusion are the same as those for oral presentations. Septirin for Infusion is for use when oral dosage is not possible.

Clinical experience with oral Septirin indicates its value in the following:

Respiratory tract: Acute and chronic bronchitis, bronchiectasis, lobar and broncho-pneumonia, *Pneumocystis carinii* pneumonitis, otitis media and sinusitis.

Genito-urinary tract: Urethritis, cystitis, pyelitis, pyelonephritis and prostatitis. Male and female gonorrhoea.

Gastro-intestinal tract: Typhoid and paratyphoid fevers, chronic carriage of *Salmonella typhi* and *paratyphi*, cholera, and shigellosis.

Skin infections: Pyoderma, abscesses and wound infections.

Other bacterial infections: Acute and chronic osteomyelitis, acute brucellosis, septicaemias and other infections caused by sensitive organisms.

Dosage and administration

Adults and children over 12 years: Standard dosage: 10 ml twice daily, morning and evening.

For severe infections: 15 ml twice daily, morning and evening.

Children up to 12 years: The recommended dosage is approximately 6 mg trimethoprim and 30 mg sulphamethoxazole per kg body weight per 24 hours, divided into two equal doses. As a guide the following doses of Septirin for Infusion may be used:

6 weeks to 6 months: 1.25 ml twice daily.

6 months to 6 years: 2.5 ml twice daily.

6–12 years: 5.0 ml twice daily.

It is intended that Septirin for Infusion should be used only during such a period as the patient is unable to accept oral therapy. It is recommended that the dosage for severe infections, indicated above, should not be administered for more than three successive days. In general, administration is unlikely to be required for more than a few days.

Dosage in *Pneumocystis carinii* pneumonitis: The dosage is 15 to 20 mg trimethoprim, 75 to 100 mg sulphamethoxazole/kg/day in divided doses. The course is two weeks, but oral therapy should be substituted as soon as it is appropriate.

Dosage recommendations in renal impairment: If Septirin is given to patients with renal impairment then the following dosage scheme is suggested (no information is available for children with renal failure).

Creatinine Serum creatinine Dosage
clearance (μmol/l)
(ml/min)

Above 25	men < 265 women < 175	Standard dosage.
15–25	men 265–620 women 175–400	Standard dosage for a maximum of three days followed by half the standard dosage.
Below 15	men > 620 women > 400	Not to be administered unless haemodialysis facilities are available. Under this condition half the standard dosage may be given.

Measurements of plasma concentrations of sulphamethoxazole at intervals of two to three days are recommended in samples obtained 12 hours after

administration of Septrin. If the concentration of total sulphamethoxazole exceeds 150 mcg/ml then treatment should be interrupted until the value falls below 120 mcg/ml.

Administration: Septrin for Infusion must be given by the intravenous route **ONLY** and **MUST BE DILUTED** before administration, according to the following schedules:

One ampoule Septrin for Infusion (5 ml) to 125 ml infusion solution.

Two ampoules Septrin for Infusion (10 ml) to 250 ml infusion solution.

Three ampoules Septrin for Infusion (15 ml) to 500 ml infusion solution.

DILUTION SHOULD BE CARRIED OUT DIRECTLY BEFORE USE. After the addition of Septrin for Infusion to the infusion solution the mixture should be shaken to ensure thorough mixing. Should visible turbidity or crystallisation appear in the solution at any time before or during an infusion the mixture should be discarded.

Septrin for Infusion is known to be compatible, when diluted in accordance with the schedules above, with the following fluids:

Dextrose Injection BP 5% and 10%.

Laevulose Injection BP 5%.

Sodium Chloride Injection BP (0.9%).

Sodium Chloride (0.18%) and Dextrose (4%) Injection BP.

Dextran 70 Injection BP 6% in dextrose 5% or normal saline.

Dextran 40 Injection BP 10% in dextrose 5% or normal saline.

Ringer's Solution for Injection BPC 1959.

No other substance should be mixed with the infusion.

It is suggested that the duration of the infusion should be approximately one and a half hours, but this should be balanced against the fluid requirements of the patient.

Contra-indications, warnings, etc

Contra-indications: Septrin should not be given to patients with a history of sulphonamide, trimethoprim or co-trimoxazole hypersensitivity.

Contra-indicated in patients showing marked liver parenchymal damage.

Except in certain circumstances it should not be given to patients with serious haematological disorders. The combination has been administered to patients receiving cytotoxic agents without evidence of an adverse effect on the bone marrow or peripheral blood.

Contra-indicated in severe renal insufficiency where repeated measurements of the plasma concentration cannot be performed.

Septrin should not be given to premature babies nor to full-term infants during the first six weeks of life. The drug should not be given during pregnancy. (See below.)

Precautions: In cases with renal impairment a modified dosage schedule as described above is indicated. In such patients, measurement of the plasma concentration of the drug is advisable, and an adequate urinary output should be maintained.

A folate supplement should be considered when treating potentially folate deficient patients.

If Septrin treatment is prolonged, especially in patients with suspected impairment of folate metabolism, it is suggested that complete blood counts including thrombocytes be performed at monthly intervals.

The usual caution in prescribing any drug for women of child-bearing age should be exercised with Septrin.

Care should be taken when giving Septrin to patients receiving sulphonylurea hypoglycaemics, oral anticoagulants of the coumarin group or phenytoin as the action of these agents may be increased.

Patients receiving pyrimethamine in doses in excess of 25 mg weekly who are also receiving Septrin should have their blood pictures monitored because of the occasional report of megaloblastic anaemia apparent occurring in these circumstances.

Side- and adverse effects: Nausea, vomiting, diarrhoea, glossitis and skin rashes can occur. Pseudomembranous colitis has been reported rarely. Isolated cases of severe skin sensitivity reactions such as erythema multiforme bullosa (Stevens-Johnson syndrome) and toxic epidermal necrolysis (Lyell syndrome) have occurred.

As Septrin contains a sulphonamide, the possibility of blood dyscrasias like those associated with sulphonamides should be borne in mind. The changes reported with Septrin mainly consist of thrombocytopenia, purpuric leucopenia, neutropenia and very rarely agranulocytosis. They have usually proved to be reversible on withdrawal of the drug. Elderly patients are more susceptible to the blood changes. Septrin may induce haemolysis in certain susceptible glucose-6-phosphate dehydrogenase deficient patients.

There have been a few reports of subjective experiences such as headache, depression, dizziness or hallucinations but their relationship to therapy remain unproven.

During long-term therapy, isolated cases of megaloblastic changes in the bone marrow have been reported; these are reversible by folic acid therapy.

Use in pregnancy and lactation: The safety of Septrin in human pregnancy has not been established. Animal studies have shown teratogenic effects typical of a folate antagonist in rats but not rabbits at high doses; these were prevented by administration of dietary folate. Sulphonamide-containing products should not be administered in late pregnancy because of the risk of kernicterus.

Both sulphamethoxazole and trimethoprim may be found in breast milk, but this does not contra-indicate the use of Septrin in lactating mothers.

Toxicity and treatment of overdosage: Not applicable.

Pharmaceutical precautions Store below 25°C. Protect from light.

Legal category POM.

Package quantities Box of 10 ampoules.

Further information In the treatment of tonsillopharyngitis due to Group A beta-haemolytic streptococci eradication of these organisms from the oropharynx is less rapid than with some other antibiotics.

Trimethoprim may cause an apparent rise in serum creatinine levels due to (a) competition for the tubular secretory mechanisms; (b) chemical interference with the visual auto-analyser method of estimating creatinine.

Co-trimoxazole may cause a fall in peripheral thyroid hormone levels but the clinical significance requires confirmation.

Septrin is available also as: Tablets, Dispersible Tablets, Forte Tablets, Adult Suspension, Paediatric Suspension, Paediatric Tablets, and Intramuscular Injection.

Product licence number 0003/0095.

EPTRIN® INTRAMUSCULAR INJECTION

approved name: Co-trimoxazole

presentation Septrin IM Injection contains 160 mg rimethoprim BP and 800 mg Sulphamethoxazole BP in each 3 ml ampoule.

The sterile solution is faintly yellow and contains the cative substances in a 52 per cent v/v solution of lycofurol.

The pH of the solution is approximately 9.0–10.5.

Ises Antibacterial agent. Septrin is effective *in vitro* against a wide range of Gram-positive and Gram-negative organisms. It is not active against *Mycobacterium tuberculosis*, *Mycoplasma* or *Treponema pallidum*. *Pseudomonas aeruginosa* is usually insensitive.

In general, the indications for the use of Septrin intramuscular are the same as for oral presentations. Septrin Intramuscular should be used when the intramuscular route is considered preferable.

Clinical experience with oral Septrin indicates its value in the following:

Respiratory tract: Acute and chronic bronchitis, bronchiectasis, lobar and broncho-pneumonia, *Pneumocystis carinii* pneumonitis, otitis media and sinusitis.

Genito-urinary tract: Urethritis, cystitis, pyelitis, pyelonephritis and prostatitis. Male and female gonorrhoea.

Gastro-intestinal tract: Typhoid and paratyphoid fevers, chronic carriage of *Salmonella typhi* and *paratyphi*, cholera and shigellosis.

Skin infections: Pyoderma, abscesses and wound infections.

Other bacterial infections: Acute and chronic osteomyelitis, acute brucellosis, septicaemias and other infections caused by sensitive organisms.

Dosage and administration *Adults and children over 12 years:* Standard dosage: One 3 ml ampoule 12-hourly, morning and evening.

Maximum dosage (for severe infections): One and a half ampoules (4.5 ml) 12-hourly, morning and evening, or one 3 ml ampoule three times daily.

Children aged 6–12 years: The usual recommended dose is half an ampoule (1.5 ml) 12-hourly, morning and evening (this dose is based on an average of 6 mg trimethoprim plus 30 mg sulphamethoxazole per kg body weight daily).

Slight adjustment of this dose may be necessary for children whose body weights approach the extremes of the range for their height and age.

It is NOT recommended that Septrin Intramuscular Injection be given to children under the age of six years because of their small muscle mass.

It is intended that Septrin IM Injection should be used only during such a period as the patient is unable to accept oral therapy. It is recommended that the standard dosage (above) should not normally be administered for more than five successive days nor the maximum dosage (above) for more than three successive days.

Dosage in *Pneumocystis carinii* pneumonitis: Since the volume containing the suggested dose exceeds the maximum recommended, the use of Septrin Intramuscular is inappropriate. Septrin for Infusion should be administered if parenteral therapy is required.

Dosage recommendations in renal impairment: If Septrin is given to patients with renal impairment then the following dosage scheme is suggested (no information is available for children with renal failure).

<i>Creatinine clearance (ml/min)</i>	<i>Serum creatinine (μmol/l)</i>	<i>Dosage</i>
Above 25	men < 265 women < 175	Standard dosage.
15–25	men 265–620 women 175–400	Standard dosage for a maximum of three days followed by half the standard dosage.
Below 15	men > 620 women > 400	Not to be administered unless haemodialysis facilities are available. Under this condition half the standard dosage may be given.

Measurements of plasma concentration of sulphamethoxazole at intervals of two to three days are recommended in samples obtained 12 hours after administration of Septrin. If the concentration of total sulphamethoxazole exceeds 150 mcg/ml, then treatment should be interrupted until the value falls below 120 mcg/ml.

Administration: Septrin IM Injection must be given by this route ONLY and ONLY when an intramuscular formulation is indicated by the clinical condition.

The injection should be made deep into the upper and outer quadrant of the buttock, and injections should be given into each buttock alternately.

If the total contents of an ampoule are not used after opening then the remainder should be destroyed.

Contra-indications, warnings, etc

Contra-indications: Septrin should not be given to patients with a history of sulphonamide, trimethoprim or co-trimoxazole hypersensitivity.

Contra-indicated in patients showing marked liver parenchymal damage.

Except in certain circumstances it should not be given to patients with serious haematological disorders. The combination has been administered to patients receiving cytotoxic agents without evidence of an adverse effect on the bone marrow or peripheral blood.

Contra-indicated in severe renal insufficiency where repeated measurements of the plasma concentration cannot be performed.

Septrin should not be given to premature babies nor to full-term infants during the first six weeks of life. The drug should not be given during pregnancy. (See below.)

Precautions: In cases with renal impairment a modified dosage schedule as described above is indicated. In such patients, measurements of the plasma concentration of the drug is advisable, and an adequate urinary output should be maintained.

A folate supplement should be considered when treating potentially folate deficient patients.

The usual caution in prescribing any drug for women of child-bearing age should be exercised with Septrin.

If Septrin treatment is prolonged, especially in patients with suspected impairment of folate metabolism, it is suggested that complete blood counts including thrombocytes be performed at monthly intervals.

Care should be taken when giving Septrin to patients receiving sulphonylurea hypoglycaemics, oral anticoagulants of the coumarin group or phenytoin as the action of these agents may be increased.

Patients receiving pyrimethamine in doses in excess of 25 mg weekly who are also receiving Septrin should have their blood pictures monitored because of the occasional report of megaloblastic anaemia apparently occurring in these circumstances.

Side- and adverse effects: On the basis of animal experiments some local muscle damage is to be expected but experience has shown that this does not appear to be a clinical problem. Local reactions mainly vary from mild to moderate pain at the injection site; induration is uncommon.

Nausea, vomiting, diarrhoea, glossitis and skin rashes can occur. Pseudomembranous colitis has been reported rarely. Isolated cases of severe skin sensitivity reactions such as erythema multiforme bullosa (Stevens-Johnson syndrome) and toxic epidermal necrolysis (Lyell syndrome) have occurred.

As Septrin contains a sulphonamide, the possibility of blood dyscrasias like those associated with sulphonamides should be borne in mind. The changes reported with Septrin mainly consist of thrombocytopenia, purpura, leucopenia, neutropenia and very rarely agranulocytosis. They have usually proved to be reversible on withdrawal of the drug. Elderly patients are more susceptible to these blood changes. Septrin may induce haemolysis in certain susceptible glucose-6-phosphate dehydrogenase deficient patients.

There have been a few reports of subjective experiences such as headache, depression, dizziness and hallucinations but their relationship to therapy remains unproven.

During long-term therapy, isolated cases of megaloblastic changes in the bone marrow have been reported: those are reversible by folic acid therapy.

Use in pregnancy and lactation: The safety of Septrin in human pregnancy has not been established. Animal studies have shown teratogenic effects typical of a folate antagonist in rats but not rabbits at high doses; these were prevented by administration of dietary folates. Sulphonamide-containing products should not be administered in late pregnancy because of the risk of kernicterus.

Both sulphamethoxazole and trimethoprim may be found in breast milk, but this does not contra-indicate the use of Septrin in lactating mothers.

Toxicity and treatment of overdosage: Not applicable.

Pharmaceutical precautions Do not use if the injection solution is cloudy or if precipitation has occurred. Store below 25°C. Do not freeze. Protect from light.

Legal category POM.

Package quantities Box of 10 ampoules.

Further information In the treatment of tonsillopharyngitis to Group A beta-haemolytic streptococci, eradication of these organisms from the oropharynx is less rapid than with some other antibiotics.

Trimethoprim may cause an apparent rise in serum creatinine levels due to (a) competition for the tubular secretory mechanisms; (b) chemical interference with the visual auto-analyser method of estimating creatinine.

Co-trimoxazole may cause a fall in peripheral thyroid hormone levels but the clinical significance requires confirmation.

Septrin is available also as: Tablets, Dispersible Tablets,

Forte Tablets, Adult Suspension, Paediatric Suspension Paediatric Tablets and Septrin for Infusion.

Product licence number 0003/0124.

SYRAPRIM* TABLETS

Presentation White scored tablets coded 'Y3C' containing 300 mg Trimethoprim BP. White scored tablets coded Q9A containing 100 mg Trimethoprim BP.

Uses Antibacterial agent indicated for the treatment of infections due to trimethoprim-sensitive organisms, particularly those affecting the urinary and respiratory tracts. Also for the long-term prophylaxis of recurrent, or suppression of chronic, urinary tract infections caused by sensitive organisms.

Syraprim is active *in vitro* against a wide range of Gram-negative and Gram-positive organisms. It is not active against *Pseudomonas* spp., *Mycobacterium tuberculosis*, *Mycoplasma*, *Clostridia*, *Treponema pallidum* and anaerobes. It is relatively inactive against *Brucella* and *Neisseria*.

Dosage and administration *Urinary Tract Infections:*
Treatment:

Adults: 300 mg once daily.

Children over 12 years: as for adults.

6-12 years: 150 mg once daily.

Under 6 years: formulation inapplicable.

Prophylaxis:

Adults: 100 mg once daily.

Children over 12 years: as for adults.

6-12 years: 50 mg once daily.

Under 6 years: formulation inapplicable.

To ensure maximal urinary concentrations it may be advantageous to take the dose at bedtime.

Respiratory Infections:

Adults: 200 mg twice daily.

Children over 12 years: as for adults.

6-12 years: 100 mg twice daily.

6 months-6 years: 50 mg twice daily.

In acute infections, Syraprim should be given for at least five days or until the patient has been symptom-free for two days. Long-term administration may be continued for 3 to 12 months or more as appropriate.

Dosage recommendations in renal impairment: When creatinine clearance is below 15-20 ml/minute, trimethoprim levels should be monitored after approximately 3 days' treatment to provide guidance on the appropriate dosage reduction. When the clearance is below 10 ml/minute Syraprim should not be administered unless plasma concentrations can be estimated regularly and haemodialysis facilities are available.

Contra-indications, warnings, etc

Contra-indications: Syraprim should not be given to patients with a history of hypersensitivity to trimethoprim.

Contra-indicated in patients with severe impairment of renal function where repeated estimations of the plasma concentration, or haemodialysis, cannot be carried out.

Precautions: Care should be taken when giving the drug to patients with blood dyscrasias.

Caution should be exercised in the administration of Syraprim to patients with actual or potential folate deficiency and administration of a folate supplement should be considered.

Care should be taken if Syraprim and warfarin or phenytoin are co-administered as occasional potentiation of the effects of these agents may occur.

Patients receiving pyrimethamine in doses in excess of 25 mg weekly for malarial prophylaxis and who are given Syraprim should have their blood pictures monitored because of the possibility of megaloblastic anaemia developing.

During prolonged administration regular blood counts are advised. It is suggested that blood counts be performed at approximately monthly intervals.

Side- and adverse effects: Minor gastro-intestinal disturbances including nausea and vomiting, sore mouth/tongue, pruritus and skin rashes may occasionally occur. Although an effect on folate metabolism is possible, interference with haematopoiesis rarely occurs at the recommended dose. If any such change is seen, folic acid should reverse the effect. Elderly patients may be more susceptible and a lower dosage may be advisable.

Use in pregnancy and lactation: The safety of trimethoprim in human pregnancy has not been established. Animal studies have shown, at high doses, teratogenic effects typical of a folate antagonist in rats but not rabbits; these were prevented by administration of dietary folates. The benefit of using Syraprim in pregnancy should be weighed against the possible hazard.

Despite its excretion in breast milk the administration of Syraprim to a lactating woman represents a negligible risk to the suckling infant.

Toxicity and treatment of overdosage: Nausea, vomiting, abdominal pain, dizziness and confusion are likely symptoms of overdosage. Gastric lavage may be useful although absorption of trimethoprim from the gastro-intestinal tract is normally complete in approximately 2 hours. This may not be the case in gross overdosage. There is no specific antidote but calcium folinate 3–6 mg given for five to seven days should counteract any effect on the bone marrow. Acidification of the urine will increase the elimination of trimethoprim. General supportive measures are recommended.

Pharmaceutical precautions Store below 25°C and protect from light.

Legal category POM.

Package quantities

Bottle of 100 × 300 mg tablets.

Bottles of 28 and 100 × 100 mg tablets.

Further information Absorption by the oral route is rapid; significant plasma levels are obtained within half an hour; peak levels may be reached as early as one hour.

Excretion is predominantly in the urine in the form of unchanged drug. Urinary concentrations are generally well above the MIC of common pathogens for more than 24 hours after the last dose.

Trimethoprim may cause an apparent rise in serum creatinine levels due to (a) competition for the tubular secretory mechanisms; (b) chemical interference with the visual auto-analyser method of estimating creatinine.

Product licence numbers

300 mg tablets 0003/0148

100 mg tablets 0003/0147

SYRAPRIM® INJECTION

Presentation Syraprim Injection is a sterile aqueous solution of trimethoprim lactate equivalent to 20 mg trimethoprim base in 1 ml of water. Each ampoule contains 5 ml.

Uses Antibacterial agent indicated for the treatment of infections due to sensitive organisms, in particular for Gram-negative infections. Trimethoprim is effective *in vitro* against a wide range of Gram-negative and Gram-positive organisms. It is not active against *Pseudomonas* spp., *Mycobacterium tuberculosis*, *Mycoplasma*, *Clostridia*, *Treponema pallidum*, and anaerobes. It is relatively inactive against *Brucella* and *Neisseria*.

Dosage and administration *Dosage: Adults and children over 12 years:* 150–250 mg every 12 hours. *Children under 12 years:* The total daily dose should approximate to 6–9 mg/kg of body weight divided into two or three equal doses and administered either 12-hourly or 8-hourly.

The severely ill patient may require initially higher, or more frequent, doses as may a person considerably in excess of the average weight for his/her height. Total daily doses up to 20 mg/kg of body weight in divided doses have been well tolerated.

Dosage recommendations in renal impairment: When creatinine clearance is below 15–20 ml/minute, trimethoprim levels should be monitored after approximately 3 days' treatment to provide guidance on the appropriate dosage reduction. When the clearance is below 10 ml/minute Syraprim should not be administered unless plasma concentrations can be estimated regularly and haemodialysis facilities are available.

Administration: Syraprim Injection should be administered slowly as a bolus:

1. By direct intravenous injection, or
2. via the tubing (close to the vein) of an established intravenous infusion.

If it is necessary to add Syraprim Injection to the infusion fluid it is compatible with the following:

Dextrose Injection BP 5% w/v.

Laevulose Injection BP 5% w/v.

Sodium Lactate Injection BP.

Contra-indications, warnings, etc

Contra-indications: Syraprim should not be given to patients with a history of hypersensitivity to trimethoprim.

Contra-indicated in patients with severe impairment of renal function where repeated estimations of the plasma concentration, or haemodialysis cannot be carried out.

Precautions: Care should be taken when giving the drug to patients with blood dyscrasias.

Caution should be exercised in the administration of Syraprim to patients with actual or potential folate deficiency, and administration of a folate supplement should be considered.

Care should be taken if Syraprim and warfarin or phenytoin are co-administered as occasional potentiation of the effects of these agents may occur.

Patients receiving pyrimethamine in doses in excess of 25 mg weekly for malarial prophylaxis and who are given Syraprim should have their blood pictures monitored because of the possibility of megaloblastic anaemia developing.

Side- and adverse effects: Minor gastro-intestinal disturbances including nausea and vomiting, sore

mouth/tongue, pruritus and skin rashes may occasionally occur. An effect on folate metabolism is possible but rarely occurs. Interference with haematopoiesis may occur particularly if the daily dose exceeds 500 mg in adults. Folinic acid should reverse any such effect. Elderly patients may be more susceptible and a lower dosage may be advisable.

Nausea due to too rapid injection may occur and if so the time over which the injection is given should be prolonged.

Use in pregnancy and lactation: The safety of trimethoprim in human pregnancy has not been established. Animal studies have shown, at high doses, teratogenic effects typical of a folate antagonist in rats but not rabbits; these were prevented by administration of dietary folates. The benefit of using Syraprim in pregnancy should be weighed against its possible hazard.

Despite its excretion in breast milk the administration of Syraprim to a lactating woman represents a negligible risk to the suckling infant.

Toxicity and treatment of overdosage: Not applicable.

Pharmaceutical precautions Store below 25°C and protect from light.

Syraprim Injection should not be added to any chloride-containing infusion fluid.

Syraprim Injection is incompatible with solutions of sulphonamides and the two should not be mixed.

Legal category POM.

Package quantities Box of 10 ampoules.

Further information Excretion is predominantly in the urine in the form of unchanged drug.

Trimethoprim may cause an apparent rise in serum creatinine levels due to (a) competition for the renal tubular secretory mechanism, (b) chemical interference with the usual auto-analyser method of estimating creatinine.

Syraprim Injection may be given in conjunction with, but separately from, parenteral aminoglycosides, metronidazole, or sulphonamides depending on the organism responsible for the infection.

Product licence number 0003/0149.

TETANUS VACCINE BP (IN SIMPLE SOLUTION) WELLCOME* (Tet/Vac/FT)

Presentation Tetanus vaccine is prepared by formalin detoxification of *Clostridium tetani* exotoxin. Thiomersal BP is added as a preservative to a concentration of 0.01%. Each 0.5 ml dose contains 14Lf toxoid.

The antigenic content and formulation of this vaccine has not been changed, although the labelled content has been altered to conform with the flocculation equivalence of the new British reference antitoxin preparation.

Uses For active immunisation against tetanus.

Administration of the antigenically more potent adsorbed vaccine is usually preferred for all injections. Tetanus vaccine in simple solution is insufficiently antigenic to be used as the first immunising dose but may be used instead of adsorbed tetanus vaccine if necessary for the second, third or later reinforcing injections. Tetanus vaccine in simple solution is now often reserved for administration to patients who have had some reaction to a previous dose of adsorbed vaccine and who are not thought to be adequately protected against infection.

Dosage and administration The dose of tetanus vaccine in simple solution is 0.5 ml given by deep subcutaneous or intramuscular injection. When Tetanus vaccine in simple solution is used for second or third doses in an immunising course, intervals of 6 to 12 weeks and 6 to 12 months respectively are recommended between the first and second and the second and third doses.

The United Kingdom Department of Health and Social Security recommend the administration of reinforcing doses after five years and after a further 5 to 15 years with the administration of additional doses in the event of injuries which may give rise to tetanus. Tetanus vaccine should not be given to any patient who has received a booster dose in the preceding year.

A single dose of vaccine given several years after the completion of a primary course will rapidly stimulate the production of tetanus antitoxin in the circulation.

In subjects who have suffered a reaction to a previous dose of adsorbed vaccine it may be preferred to administer 0.1 ml of tetanus vaccine in simple solution intradermally.

Oral Poliomyelitis Vaccine BP may be given at the same time as tetanus vaccine.

Shake well before each dose is withdrawn. Record the title, dose and lot numbers of all vaccines and the date administered. Report any untoward reactions.

Contra-indications, warnings, etc

Contra-indications: The vaccine should not be administered to a subject who has experienced a serious reaction (e.g. anaphylaxis) to a previous dose of this vaccine or who is known to be hypersensitive to any component thereof. It is advisable to avoid vaccination during an acute infection. Tetanus vaccine in simple solution should not be given simultaneously with human tetanus immunoglobulin or tetanus antitoxin which may markedly depress its antigenicity.

Precautions: Although anaphylaxis is rare, facilities for its management should always be available during vaccination.

Side- and adverse effects: Local reactions consisting of swelling, redness and pain may develop at the injection site and persist for several days. Delays of up to 10 days before symptoms develop are reported. Local reactions are rare in children and the incidence increases with age and according to the number of previously administered doses. General reactions are uncommon but may include headache, lethargy, malaise, myalgia and pyrexia. Acute anaphylactic reactions, urticaria, angioneurotic oedema, serum sickness and peripheral neuropathy occasionally occur.

Use in pregnancy and lactation: In developing countries tetanus vaccines are widely administered during pregnancy to prevent neonatal tetanus without significant apparent adverse effects on pregnancy or foetal development.

Toxicity and treatment of overdosage: Not applicable.

Pharmaceutical precautions Store at 2–8°C. Protect from light. *Do not freeze.* When multidose containers are employed it is good practice to discard any partly used vaccine vials at the end of the vaccinating session.

Legal category POM.

Package quantities Pack of 5 × 0.5 ml ampoules. Vial of 5 ml.

Further information Persons of all ages are suscep-

able to tetanus unless they have been immunised with tetanus vaccine. Rarely, if ever, does natural immunity develop even in persons who have recovered from severe tetanus. Since most tetanus cases follow trivial wounds all persons should be actively immunised against the disease.

Product licence number 0003/5190.

ADSORBED TETANUS VACCINE BP WELLCOME* (Tet/Vac/Ads)

Presentation Adsorbed tetanus vaccine is a suspension of highly purified toxoid prepared by formalin detoxification of *Clostridium tetani* exotoxin. The toxoid is adsorbed onto aluminium hydroxide. Thiomersal BP is added as a preservative to a concentration of 0.01%. Each 0.5 ml dose has an immunising potency of not less than 40 International Units (IU).

The immunising potency of this vaccine is now expressed in International Units in accordance with the requirements of the European and British Pharmacopoeias. These units measure the immunising activity of the vaccine whereas the previously used Lf units expressed the quantity of toxoid present. There is no simple numerical relationship between IU and Lf. No change has been made to the potency although it is now expressed in IU.

Uses For active immunisation against tetanus.

Dosage and administration Primary immunisation consists of three deep subcutaneous or intramuscular doses of adsorbed vaccine each of 0.5 ml administered at intervals of 6 to 12 weeks and 6 to 12 months respectively. Adsorbed tetanus vaccine may be used for the routine anti-tetanus immunisation of persons of all ages although it is usual to employ plain or adsorbed combined diphtheria/tetanus/pertussis vaccine (DTPe/Vac or DTPe/Vac/Ads) or adsorbed diphtheria and tetanus vaccine (DT/Vac/Ads) for immunisation of infants.

The United Kingdom Department of Health and Social Security recommend the administration of reinforcing doses after five years and after a further 5 to 15 years with the administration of additional doses in the event of injuries which may give rise to tetanus. Tetanus vaccine should not be given to any patient who has received a booster dose in the preceding year.

A single dose of vaccine given several years after the completion of a primary course will rapidly stimulate the production of tetanus antitoxin in the circulation.

Adsorbed tetanus vaccine may be administered simultaneously with human tetanus immunoglobulin or tetanus antitoxin but must be given at separate sites. The antibody response of subjects to subsequent doses of vaccine is not significantly impaired by this procedure.

Oral Poliomyelitis Vaccine BP may be given at the same time as Tetanus Vaccine.

Shake well before each dose is withdrawn. Record the title, dose and lot numbers of all vaccines and the date administered. Report any untoward reactions.

Contra-indications, warnings, etc

Contra-indications: Adsorbed tetanus vaccine should not be administered intradermally.

The vaccine should not be administered to a subject who has experienced a serious reaction (e.g. anaphylaxis) to a previous dose of this vaccine or who is known to be hypersensitive to any component thereof. It is

advisable to avoid vaccination during an acute infection.

Precautions: Although anaphylaxis is rare, facilities for its management should always be available during vaccination.

Side- and adverse effects: Local reactions consisting of swelling, redness and pain may develop at the injection site and persist for several days. Delays of up to 10 days before symptoms develop are reported. Local reactions are rare in children and the incidence increases with age and according to the number of previously administered doses. General reactions are uncommon but may include headache, lethargy, malaise, myalgia and pyrexia. Acute anaphylactic reactions, urticaria, angioneurotic oedema, serum sickness and peripheral neuropathy occasionally occur.

Persistent nodules at the site of injection may occasionally follow administration of adsorbed vaccines especially if the inoculation is into the superficial layers of subcutaneous tissue.

Use in pregnancy and lactation: In developing countries tetanus vaccines are widely administered during pregnancy to prevent neonatal tetanus without significant apparent adverse effects on pregnancy or foetal development.

Toxicity and treatment of overdosage: Not applicable.

Pharmaceutical precautions Store at 2–8°C. Protect from light. *Do not freeze.* When multidose containers are employed it is good practice to discard any partly used vaccine vials at the end of the vaccinating session.

Legal category POM.

Package quantities Pack of 5 × 0.5 ml ampoules. Vial of 5 ml.

Further information Persons of all ages are susceptible to tetanus unless they have been immunised with tetanus vaccine. Rarely, if ever, is natural immunity developed even in persons who have recovered from severe tetanus. Since most tetanus cases follow trivial wounds all persons should be actively immunised against the disease.

Product licence number 0003/5191.

TINEAFAX* OINTMENT

Presentation Zinc Undecenoate BP 80 mg and zinc naphthenate solution 80 mg (10% zinc) in a non-greasy base. Cream in colour.

Uses To eradicate 'athlete's foot' and other ringworm infections of the skin.

Dosage and administration *Adults:* The affected parts must first be washed with soap and water and thoroughly dried. Dead or loose skin should be removed. The ointment is then rubbed into and around the lesions. This treatment is, at first, repeated night and morning then, as healing progresses, one treatment daily is sufficient. It is important to keep the feet free from moisture; a daily change of stockings is advisable.

Children: As for adults.

Contra-indications, warnings, etc

Contra-indications: No special comment.

Treatment of overdosage: Not applicable.

Pharmaceutical precautions Store below 25°C.

Legal category P.

Package quantities Tube of 25 g.

Further information Nil.

Product licence number 0003/5216.

TINEAFAX* POWDER

Presentation Zinc Undecenoate BP 100 mg per gram of white powder.

Uses Prophylactic against 'athlete's foot'.

Dosage and administration *Adults:* To avoid either initial infection or reinfection with the fungi responsible for 'athlete's foot', hosiery and shoes should be dusted inside with Tineafax Powder. The feet should be kept dry, and walking barefooted in public dressing rooms should be avoided.

Children: As for adults.

Contra-indications, warnings, etc

Contra-indications: No special comment.

Pharmaceutical precautions Store below 25°C.

Legal category GSL.

Package quantities Puffer pack of 50 g.

Further information Nil.

Product licence number 0003/5215.

TRIVAX* DIPHTHERIA, TETANUS AND PERTUSSIS VACCINE BP (DTPer/Vac)

Presentation Trivax is a sterile preparation consisting of a mixture of diphtheria and tetanus toxoids and killed whole *Bordetella pertussis*.

Each 0.5 ml of vaccine contains 25 Lf of purified diphtheria toxoid, 3.5 Lf of purified tetanus toxoid and not more than 20,000 million chemically killed *Bordetella pertussis* organisms with a potency of not less than 4 i.u., in an isotonic buffer solution. Organisms bearing all three pertussis agglutinogens are included. Vaccine of this composition has been shown to provide adequate immunising potency against each of the three diseases. Thiomersal is added as a preservative to a final concentration of 0.01%.

The antigenic content and formulation of this vaccine has not been changed, although the labelled content of the tetanus component has been altered to conform with the flocculation equivalence of the new British reference antitoxin preparation.

Uses For active immunisation against diphtheria, tetanus and whooping cough in infants and pre-school children. It is not recommended that pertussis-containing vaccines be used in older children except in areas where whooping cough is a serious problem.

Dosage and administration *Dosage: Adults:* Not recommended.

Children up to 5 years: Each dose is 0.5 ml, given by deep subcutaneous or intramuscular injection. The primary course consists of 3 doses of vaccine at intervals of not less than four weeks.

Administration: Shake well before withdrawing a dose. Record the title, dose and lot numbers of all vaccines

and the date administered. Report any untoward reactions.

Since whooping cough can often be a serious disease in the early months of life the primary course should preferably be started between the third and sixth month of life. It is believed that immune responses are better if the interval between the first and second dose is extended to six to eight weeks and the interval between the second and third dose is four to six months. It is not considered necessary to repeat the full course of immunisation if these intervals are exceeded.

Reinforcing doses: Where primary immunisation was completed during the first six to eight months of life one reinforcing dose of 0.5 ml should be given about 12 months later in order to boost immunity. Children over the age of five years do not normally require further immunisation with pertussis vaccine since whooping cough is rarely a problem in older children. However, reinforcement of immunity against diphtheria and tetanus is necessary. This can be achieved by giving 1 dose (0.5 ml) of Diphtheria and Tetanus Vaccine (DT/Vac/FT or DT/Vac/Ads) to five-year-old children and 1 dose (0.5 ml) of Tetanus Vaccine (Tet/Vac/Ads) at 15/19 years of age or on leaving school.

Contra-indications, warnings, etc

Contra-indications: The administration of pertussis-containing vaccine is contra-indicated in children with a personal or family history of epilepsy or other familial or hereditary diseases of the central nervous system. Administration of pertussis vaccine is also contra-indicated in children with a history of severe allergy, seizures, convulsions, cerebral irritation in the neonatal period, developmental neurological defect or other disorder of the central nervous system. Children with acute infection or illness, particularly those with respiratory symptoms should not be immunised until they are fully recovered. Any child exhibiting a severe local or significant general reaction to a previous dose of a pertussis-containing vaccine should not be given a further dose. However, protection against diphtheria and tetanus is advisable and can be accomplished by giving Adsorbed Diphtheria and Tetanus Vaccine.

Precautions: Since combined diphtheria, tetanus and pertussis vaccines are widely used in a population in which sudden illnesses of undefined origin are not uncommon, intercurrent illness bearing a temporal but not a causal relationship to vaccination may be expected.

Side- and adverse effects: Local reactions, particularly erythema at the site of injection, are commonly seen during the 24 hours following vaccination. They normally subside without treatment. A nodule may be found at the site of injection; this occurs less frequently and is less persistent following the administration of plain vaccine.

A transient rise in temperature, restlessness, irritability, crying or loss of appetite may sometimes occur a few hours after vaccination, but does not generally call for treatment. The incidence of these systemic reactions is lower following the administration of adsorbed vaccine. Allergic manifestations including pallor, dyspnoea and collapse have been observed rarely. Convulsions, infantile spasms and encephalopathy have been reported as rare complications after pertussis vaccination.

Convulsions may be precipitated by a febrile response to the pertussis component. In an individual case it may be difficult to distinguish between spontaneously occurring convulsions and those associated with vaccination.

Abnormal crying and persistent screaming have also

seen described as reactions which may be encountered after vaccination.

An increased incidence of reactions may occur due to failure to shake the container and re-suspend the vaccine before withdrawing a dose, to inadvertent intravenous administration or to an over-rapid injection.

Use in pregnancy and lactation: Since simultaneous vaccination against diphtheria and tetanus in adults is uncommon there is no accurate information on the safety of this vaccine in pregnancy.

Toxicity and treatment of overdosage: Not applicable.

Pharmaceutical precautions Store between 2°C and 8°C, protected from light. *Do not freeze.*

When multi-dose containers are employed, it is a good practice to discard any partly used vaccine vials at the end of the vaccinating session.

Legal category POM.

Package quantities Pack of 5 × 0.5 ml ampoules. Vial of 5 ml.

Further information Oral Poliomyelitis Vaccine BP may be given at the same time as Trivax.

Product licence number 0003/5192.

TRIVAX-AD* ADSORBED DIPHTHERIA, TETANUS AND PERTUSSIS VACCINE BP (DTPer/Vac/Ads)

Presentation Trivax-AD is a sterile preparation consisting of a mixture of diphtheria and tetanus toxoids and killed whole *Bordetella pertussis*.

Each 0.5 ml of vaccine has an immunizing potency of not less than 30 International units (IU) purified diphtheria toxoid and not less than 60 IU (mouse assay) purified tetanus toxoid, with not more than 20,000 million chemically killed *Bordetella pertussis* organisms with a potency of not less than 4 IU adsorbed onto aluminium hydroxide in an isotonic buffer solution. The aluminium content does not exceed 1.25 mg per dose. Organisms bearing all three pertussis agglutinogens are included. Vaccine of this composition has been shown to provide adequate immunizing potency against each of the three diseases. Thiomersal is added as a preservative to a final concentration of 0.01%.

The potency of this vaccine is now expressed in International Units in accordance with the requirements of the European and British Pharmacopoeias. These units measure the immunizing activity of the vaccine, whereas the previously used Lf units expressed the quantity of toxoid present. There is no simple numerical relationship between IU and Lf. No change has been made to the potency although it is now expressed in IU.

Uses For active immunisation against diphtheria, tetanus and whooping cough in infants and pre-school children. It is not recommended that pertussis-containing vaccines be used in older children except in areas where whooping cough is a serious problem.

Dosage and administration *Dosage: Adults:* Not recommended.

Children up to 5 years: Each dose is 0.5 ml, given by deep subcutaneous or intramuscular injection. The primary course consists of 3 doses of vaccine at intervals of not less than four weeks.

Administration: Shake well before withdrawing a dose.

Record the title, dose and lot numbers of all vaccines and the date administered. Report any untoward reactions.

Since whooping cough can often be a serious disease in the early months of life the primary course should preferably be started between the third and sixth month of life. It is believed that immune responses are better if the interval between the first and second dose is extended to six to eight weeks and the interval between the second and third dose is four to six months. It is not considered necessary to repeat the full course of immunisation if these intervals are exceeded.

Reinforcing doses: Where primary immunisation was completed during the first six to eight months of life one reinforcing dose of 0.5 ml should be given about 12 months later in order to boost immunity. Children over the age of five years do not normally require further immunisation with pertussis vaccine since whooping cough is rarely a problem in older children. However, reinforcement of immunity against diphtheria and tetanus is necessary. This can be achieved by giving 1 dose (0.5 ml) of Diphtheria and Tetanus Vaccine (DT/Vac/FT or DT/Vac/Ads) to five-year-old children and 1 dose (0.5 ml) of Tetanus Vaccine (Tet/Vac/Ads) at 15–19 years of age or on leaving school.

Contra-indications, warnings, etc

Contra-indications: The administration of pertussis-containing vaccine is contra-indicated in children with a personal or family history of epilepsy or other familial or hereditary diseases of the central nervous system. Administration of pertussis vaccine is also contra-indicated in children with a history of severe allergy, seizures, convulsions, cerebral irritation in the neonatal period, developmental neurological defect or other disorder of the central nervous system. Children with acute infection or illness, particularly those with respiratory symptoms should not be immunised until they are fully recovered. Any child exhibiting a severe local or significant general reaction to a previous dose of a pertussis-containing vaccine should not be given a further dose. However, protection against diphtheria and tetanus is advisable and can be accomplished by giving Adsorbed Diphtheria and Tetanus Vaccine.

Precautions: Since combined diphtheria, tetanus and pertussis vaccines are widely used in a population in which sudden illnesses of undefined origin are not uncommon, intercurrent illness bearing a temporal but not a causal relationship to vaccination may be expected.

Side- and adverse effects: Local reactions, particularly erythema at the site of injection, are commonly seen during the 24 hours following vaccination. They normally subside without treatment. A nodule may be found at the site of injection; this occurs less frequently and is less persistent following the administration of plain vaccine.

A transient rise in temperature, restlessness, irritability, crying or loss of appetite may sometimes occur a few hours after vaccination, but does not generally call for treatment. The incidence of these systemic reactions is lower following the administration of adsorbed vaccine. Allergic manifestations including pallor, dyspnoea and collapse have been observed rarely. Convulsions, infantile spasms and encephalopathy have been reported as rare complications after pertussis vaccination.

Convulsions may be precipitated by a febrile response to the pertussis component. In an individual case it may be difficult to distinguish between spontaneously occurring convulsions and those associated with vaccination.

Abnormal crying and persistent screaming have also been described as reactions which may be encountered after vaccination.

An increased incidence of reactions may occur due to failure to shake the container and re-suspend the vaccine before withdrawing a dose, to inadvertent intravenous administration, or to an over-rapid injection.

Use in pregnancy and lactation: Since simultaneous vaccination against diphtheria and tetanus in adults is uncommon there is no accurate information on the safety of this vaccine in pregnancy.

Toxicity and treatment of overdosage: Not applicable.

Pharmaceutical precautions Store between 2°C and 8°C, protected from light. *Do not freeze.*

When multi-dose containers are employed it is a good practice to discard any partly used vaccine vials at the end of the vaccinating session.

Legal category POM.

Package quantities Pack of 5 × 0.5 ml ampoules. Vial of 5 ml.

Further information Oral Poliomyelitis Vaccine BP may be given at the same time as Trivax-AD.

Product licence number 0003/5193.

TYPHOID VACCINE BP (MONOVALENT) WELLCOME* (Typhoid/Vac)

Presentation Typhoid (Monovalent) Vaccine contains heat-killed, phenol-preserved, *Salmonella typhi* organisms at a concentration of not less than 1,000 million organisms per ml.

Uses For active immunisation against typhoid fever.

Typhoid vaccine protects 70–90% of recipients against typhoid.

Dosage and administration

<i>Initial dose to be administered by deep subcutaneous or intramuscular injection</i>	<i>Time interval between administration of initial dose and second dose</i>	<i>Second dose</i>
Children 1–10 years 0.25 ml	4–6 weeks	0.25 ml by i.m. or s.c. injection or 0.1 ml by intradermal injection
Children over 10 years and adults 0.5 ml	4–6 weeks	0.5 ml by i.m. or s.c. injection or 0.1 ml by intradermal injection

Wellcome Typhoid Vaccine (Monovalent) may be administered subcutaneously, intramuscularly or intradermally. Subcutaneous or intramuscular injection should be used for the first dose but intradermal injection reduces systemic reactions and may therefore be preferred for the second dose, particularly for persons who have experienced reactions in the past.

Shake well before withdrawing dose. The interval between the first and second doses should be four to six weeks.

Although two doses of vaccine are recommended for primary immunisation, the results of field trials indicate

that one dose of typhoid vaccine is almost as effective for a short period, as two doses.

Reinforcing doses: Under conditions of continued or repeated exposure to infection a reinforcing dose of vaccine should be given at least every three years. When more than three years have elapsed since the last dose, a single dose is sufficient to boost immunity.

Contra-indications, warnings, etc

Contra-indications: The vaccine should not be administered to a subject who has experienced a serious reaction (e.g. anaphylaxis) to a previous dose of this vaccine or who is known to be hypersensitive to any component thereof. It is advisable to avoid vaccination during an acute infection.

Precautions: Typhoid vaccine produces in some people constitutional or local reactions. These are often more marked in adults over the age of 35 years, especially where there is a history of previous vaccination against typhoid.

It is prudent to avoid administering vaccine to subjects with acute infections or chronic illness.

Vaccination of children under 12 months of age is not advised because of the risk of adverse reactions, the relatively low incidence of typhoid in this age group and the relatively mild course of the disease in infants.

Although anaphylaxis is rare, facilities for its management should always be available during vaccination.

Side- and adverse effects: Local redness, swelling, pain and tenderness may appear in two or three hours.

Systemic reactions, such as malaise, nausea, headache, or pyrexia may occur, but usually disappear in 36 hours, when they are severe the patient is best kept in bed. The incidence of systemic reactions is considerably reduced by giving the vaccine intradermally, but local reactions may still occur.

Neurological complications including polyneuritis, neuritis, myelitis or various manifestations of cerebral and meningeal disease have been described following the administration of typhoid-containing vaccines.

Use in pregnancy and lactation: While no specific effects on the foetus have followed the administration of Typhoid Vaccine, it is not considered advisable to administer vaccines which may cause pyrexia during pregnancy.

Toxicity and treatment of overdosage: Not applicable.

Pharmaceutical precautions Store at 2–8°C. Protect from light. *Do not freeze.* When multi-dose containers are employed it is good practice to discard any partly used vaccine vials at the end of the vaccinating session.

Legal category POM.

Package quantities Vial of 1.5 ml.

Further information Nil.

Product licence number 0003/5195.

ZOVIRAX* I.V. for intravenous infusion ▼

Presentation Each vial contains the equivalent of 250 mg sterile acyclovir as the freeze-dried sodium salt. When reconstituted as directed, Zovirax I.V. has a pH of about 11.

Uses Zovirax I.V. is indicated in the treatment of infections caused by *Herpes simplex* virus in immuno-compromised patients.

Dosage and administration Patients with normal renal function should be treated with doses of 5 mg/kg every 8 hours. Each dose should be administered by slow intravenous infusion over one hour.

In patients with renal impairment, Zovirax I.V. should be administered with caution because the drug is excreted by the kidneys.

As transient rises in serum creatinine or urea have been reported during use of Zovirax, monitoring of renal function is recommended, particularly in patients with renal transplants where, should this occur, it could be confused with graft rejection.

The following modifications in dosage are recommended:

creatinine clearance	Dosage
5–50 ml/min	5 mg/kg every 12 hours
0–25 ml/min	5 mg/kg every 24 hours
(Anuric) – 10 ml/min	2.5 mg/kg every 24 hours or after dialysis

The dose in children should be calculated as for adults on the basis of bodyweight.

For acute infections with *Herpes simplex virus*, 5 days' treatment should be adequate. However, this should be judged in the light of the patient's illness, and the response to treatment.

Method of administration: In all cases the total dose should be administered slowly over a period of one hour. Zovirax I.V. must be given by the intravenous route only and must be reconstituted and used as directed.

Each vial (containing the equivalent of 250 mg cyclovir) should be reconstituted by the addition of 10 ml of either Water for Injections BP or Sodium Chloride Intravenous Infusion BP (0.9% w/v). The required dose/volume should be calculated on the basis of 25 mg per ml of reconstituted solution.

Zovirax I.V., after reconstitution, may be injected directly into a vein over 1 hour by a controlled rate infusion pump, or be further diluted for administration by infusion. For intravenous injection by controlled rate infusion pump, a solution containing 25 mg acyclovir/ml is used. For intravenous infusion, each vial of Zovirax I.V. should be reconstituted and then, wholly or in part according to dosage required, added to and mixed with at least 50 ml of infusion solution. The contents of two vials (500 mg of acyclovir) may therefore be added to 100 ml of infusion solution. Where the dose required or infusion is greater than 500 mg a second volume of infusion solution must be used.

Zovirax I.V., when diluted in accordance with the above schedules to give a concentration not greater than 1.5% w/v of acyclovir, is known to be compatible with the following infusion fluids and stable for up to 12 hours at room temperature (15–25°C).

Sodium Chloride Intravenous Infusion BP (0.45% and 0.9% w/v).

Sodium Chloride (0.18% w/v) and Dextrose (4% w/v) Intravenous Infusion BP.

Sodium Chloride (0.45% w/v) and Dextrose (2.5% w/v).

Intravenous Infusion BP.

Compound Sodium Lactate Intravenous Infusion BP.

(Hartmann's solution).

After addition of Zovirax I.V. to an infusion solution the mixture should be shaken to ensure thorough mixing.

Reconstitution or dilution should be carried out immediately before use and, as no preservative is included, any unused solution should be discarded. Should visible turbidity or crystallisation appear in the solution before or during the infusion, the mixture should be discarded. The solution should not be refrigerated.

Pharmacology: Zovirax is an antiviral agent which is highly active *in vitro* against *Herpes simplex* types I and II, and *Varicella zoster* viruses. Toxicity to mammalian host cells is low.

Zovirax is phosphorylated to the active triphosphate after entry into a herpes-infected cell. The first step in this process requires the presence of the HSV-coded thymidine kinase. Acyclovir triphosphate acts as an inhibitor of, and substrate for, the herpes-specified DNA polymerase, preventing further viral DNA synthesis without affecting normal cellular processes.

After intravenous administration, Zovirax is principally excreted as unchanged drug through the kidneys. Both glomerular filtration and tubular secretion contribute to its elimination in the urine. The plasma half-life of acyclovir in subjects with normal renal function is about 3 hours. The estimated half-life in an anuric patient is approximately 24 hours. A metabolite 9-carboxymethoxymethylguanine has been identified in the urine of patients treated with Zovirax I.V.

Contra-indications, warnings, etc

Contra-indications: Zovirax I.V. is contra-indicated in patients known to be previously hypersensitive to acyclovir.

Precautions: Care should be observed when administering Zovirax to patients with abnormal renal function (see above), in order to avoid accumulation. The drug should not be given as a bolus intravenous injection but by slow infusion over one hour.

Reconstituted Zovirax I.V. has a pH of approximately 11.0 and should not be administered by mouth.

Side- and adverse effects: Rapid reversible increases in blood urea and creatinine have occurred in a few patients given Zovirax intravenously. This is believed to be related to peak plasma levels and the state of hydration of the patient.

Adequate hydration of the patient should be maintained.

Severe inflammation sometimes leading to ulceration has occurred when Zovirax I.V. has been accidentally infused into extravascular tissues. Mechanical infusion pumps pose a greater risk than infusion by gravity feed.

The following events have been reported whilst patients have been receiving Zovirax I.V.: increased liver related enzymes, decreases in haematological indices, neurological reactions, and rashes. There is no evidence to suggest that these events are directly related to Zovirax therapy.

Use in pregnancy and lactation: Studies in animals with systemically administered Zovirax have not demonstrated an effect on the foetus. However, as there has been no clinical experience of the effects of Zovirax intravenous injection on human pregnancy, or the foetus, caution should be exercised in prescribing Zovirax to pregnant women. No information is available on levels of Zovirax which may appear in breast milk after administration of Zovirax I.V.

Drug interactions: Zovirax is not known to interact with any other drug.

Toxicity and treatment of overdosage: Single doses of up to 80 mg/kg have been accidentally administered with no adverse consequences. Zovirax I.V. is dialysable.

Two-generation studies in mice did not reveal any effect on fertility.

Pharmaceutical precautions Store below 25°C. The injection contains no preservative. Reconstitution and dilution should therefore be carried out immediately before use and any unused solution should be discarded. The reconstituted or diluted solution should not be refrigerated.

Legal category POM.

Package quantities Pack of 5 vials.

Further information Nil.

Product licence number 0003/0159.

ZOVIRAX* OPHTHALMIC OINTMENT ▼

Presentation White to pale yellow sterile ointment containing 3 per cent w/w acyclovir in a white soft paraffin base.

Uses Treatment of herpes simplex keratitis. Acyclovir is an antiviral agent which is highly active *in vitro* against herpes simplex (HSV) types I and II.

Dosage and administration *Adults:* 1 cm ribbon of ointment should be placed inside the lower conjunctival sac five times a day at approximately four hourly intervals. Treatment should continue for at least 3 days after healing is complete.

Children: As for adults.

Pharmacology: Acyclovir is phosphorylated to the active compound acyclovir triphosphate after entry into a herpes infected cell. The first step in this process requires the presence of the HSV coded thymidine kinase. Acyclovir triphosphate acts as an inhibitor of, and substrate for, the herpes specified DNA polymerase, preventing further viral DNA synthesis without affecting normal cellular processes. Acyclovir is rapidly absorbed through the corneal epithelium and superficial ocular tissues. In animals, it achieves antiviral concentrations in aqueous humor. It has not been possible by existing methods to detect acyclovir in the blood after topical

application to the eye. However, trace quantities may be measured in the urine. These levels are not clinically significant.

Contra-indications, warnings, etc *Contra-indications:* Patients with a known hypersensitivity to acyclovir.

Side- and adverse effects: For ophthalmic use only. Transient mild stinging immediately following administration occurs in a small proportion of patients. Superficial punctate keratopathy has been reported but has not resulted in patients being withdrawn from therapy, nor healing has occurred without apparent sequelae.

The results of a wide range of mutagenicity tests *in vitro* and *in vivo* indicate that acyclovir does not pose a genetic risk to man.

Acyclovir is not known to interact with any other drugs.

Use in pregnancy and lactation: No teratogenicity, embryotoxicity or effects on fertility have been demonstrated following systemic administration of acyclovir in animal studies.

The results of tests in animals indicate that Zovirax ophthalmic ointment does not affect human fertility. Two-generation mouse studies have shown no effects on fertility have been demonstrated.

No information is available on levels of acyclovir which may appear in breast milk after administration of Zovirax ophthalmic ointment.

Toxicity and treatment of overdosage: No untoward effects would be expected if the entire contents of the tube containing 135 mg of acyclovir were ingested orally. Single oral doses of 600 mg and daily doses of 1,000 mg have been administered to human volunteers without adverse effects.

Pharmaceutical precautions When stored below 25°C Zovirax ophthalmic ointment can be expected to have a shelf life of 3 years. Discard one month after opening.

Legal category POM.

Package quantities 4.5 g tube.

Further information Nil.

Product licence number 0003/0150.

WINTHROP

ACTAL*

Presentation 1. Flat, white tablets with bevelled edges. 12.7 mm in diameter, marked Actal on both faces, containing 360 mg alxetol sodium.

2. A white suspension with a slight odour and a sweet taste. Each 5 ml contains 360 mg alxetol sodium.

Uses Actal is an antacid. It is recommended for the relief of hyperacidity, dyspepsia and pain due to peptic ulcer.

Dosage and administration For oral administration only.

Adults: Tablets – 1 or 2 to be sucked. Suspension – one to two 5 ml spoonfuls. The dose may be repeated as required.

Contra-indications, warnings, etc There are no known contra-indications or adverse reactions and no cases of overdosage have been reported. If a large amount is taken it should be sufficient to empty the stomach by emesis.

Pharmaceutical precautions Store the tablets in a cool place.

Legal category Actal Tablets GSL
Actal Suspension P.

Package quantities Actal tablets are available in packs of 24, 48, 96 and 250.
Actal Suspension is supplied in white polyethylene bottles containing 300 ml.

Further information Each Actal tablet (or 5 ml of suspension) contains 14 mg sodium.

Product licence numbers

Actal Suspension 0071/0089

ALEVAIRE*

Presentation A clear, colourless solution which foams on shaking, containing tyloxapol 0.125% w/v. Alevaire has a slight characteristic odour.

Uses Alevaire is recommended for use as a mucolytic agent in the treatment of lung conditions accompanied by complicated by excessive or thickened bronchopulmonary secretions. It may also be used as a vehicle for aerosol medication. Alevaire containing one or more antibiotics may be used in a closed irrigation system for the treatment of pyogenic bone or joint infections.

Dosage and administration

As a mucolytic agent: In continuous therapy the dose of Alevaire delivered will depend on the nebuliser used and the oxygen/air flow rate. For example, using an oxygen/air atomiser from 144 to 360 ml is nebulised in 24-hour period with gas flows of 4–8 litres per minute.

In intermittent therapy, Alevaire is inhaled three or four times a day for periods of 20 minutes, resulting in the administration of from 6 ml to 20 ml of Alevaire in a 24-hour period. Infants and small children are best treated in an oxygen tent or incubator, the mist being led into the tent through one of the nursing apertures. Treatment should be maintained for one or two days or until improvement is apparent.

2. *As a vehicle for aerosol medication:* Because of its stability and carrying properties, Alevaire mist can be used to deliver certain medicaments to the lungs. The use of Alevaire enables the drugs to reach the fine subdivisions of the bronchioles and facilitates their distribution over a wide area.

3. *In pyogenic bone or joint infections:* A suitable irrigation solution may be prepared by mixing 200 ml Alevaire with 800 ml physiological saline in which one or more appropriate antibacterial agents are dissolved. This solution is run into the wound at the rate of 80 ml per hour (about 2 litres in 24 hours).

Contra-indications, warnings, etc There are no known contra-indications.

After prolonged therapy, slight inflammation of the eyelids may develop, but this clears rapidly when treatment is discontinued.

Pharmaceutical precautions Containers of Alevaire which have been opened are easily contaminated by mould or bacteria which grow readily in the solution. If only small amounts of Alevaire are required they should be removed from the original containers with aseptic precautions. Alternatively, any unused solution in containers should be discarded after 24 hours. Alevaire should not be used if it becomes cloudy or develops a sediment.

Any Alevaire Solution remaining in a nebuliser after use should be discarded and the nebuliser rinsed and cleaned. If nebulisers are left uncleaned the Alevaire evaporates leaving a gummy residue. Alevaire should not be allowed to come into contact with brass or copper because of possible damage to the metal surface.

As a general rule, the addition of supplementary drugs to bulk containers of Alevaire is not recommended, as it may prove wasteful and difficult to determine the amount of nebulised drug received by the patient. It is preferable to dissolve the medication in a small quantity of Alevaire for administration over a short period.

Legal category P.

Package quantities Alevaire is supplied in non-reclosable amber glass bottles containing 60 or 200 ml.

Further information Alevaire is best administered as a fine mist produced by a nebuliser activated by oxygen or a motor-driven air compressor capable of reducing particle size to 0.5–5 µm.

Product licence number 0071/5019.

BENORAL* TABLETS AND SUSPENSION

Presentation

1. Benoral Suspension is a white suspension, 10 ml of which contain 4 g benorylate.

2. Benoral Tablets are white, capsule-shaped tablets marked benoral on one side only.

Each tablet is 17.5 mm long and 8 mm wide and contains 750 mg benorylate.

3. Benoral Granules: P.F.P. laminate sachets filled with a white, free-flowing powder with a sweet taste, which disperses readily in water. The contents of each sachet are equivalent to 2 g benorylate.

Uses Benorylate is an anti-inflammatory analgesic and antipyretic. Benoral is recommended for the treatment of rheumatoid arthritis, osteoarthritis and painful musculoskeletal conditions. It may also be used to relieve mild to moderate pain of non-rheumatic origin such as dysmenorrhoea and as an antipyretic in febrile conditions.

Dosage and administration Benoral is for oral administration only.

Benoral tablets: Adults: Two 750 mg tablets (1.5 g benorylate) three times a day is usually adequate to relieve pain and stiffness in osteoarthritis, quiescent rheumatoid arthritis and soft tissue rheumatism.

Benoral suspension: Adults: 10 ml of suspension (4 g benorylate) twice daily is normally required to treat active rheumatoid arthritis.

Patients with osteoarthritis, quiescent rheumatoid arthritis or soft tissue (non-articular) rheumatism who prefer the liquid preparation may be given 5 ml Benoral Suspension (2 g benorylate) twice daily.

Children: 6–12 years: 500 mg not more than four times daily.

2–6 years: 500 mg not more than three times daily.

1–2 years: 250 mg not more than four times daily.

3 months–1 year: 25 mg/kg body weight not more than four times daily.

Benoral should not be given to children under the age of three months.

In children with Still's disease, an initial dose of 200 mg/kg body weight daily has been used with adjustment after 7 days to a level sufficient to maintain blood salicylate at an anti-inflammatory level (25–30 mg/100 ml).

Benoral Granules: The contents of the prescribed number of sachets should be stirred into half a glass of water (or milk, if preferred) and drunk immediately.

Adults: For acute rheumatic conditions up to 4 sachets daily in divided doses may be required but 3 sachets are often adequate. For milder rheumatic conditions and for the relief of non-rheumatic pain, one sachet twice daily is recommended.

Not suitable for children: use Benoral Suspension.

Contra-indications, warnings, etc

Contra-indications: Benoral should not be given to patients with active peptic ulcer, or to those known to be hypersensitive to aspirin (including those with haemophilia and similar coagulation disorders).

Precautions: Patients who are also taking anticoagulants should have their prothrombin time checked.

Patients taking Benoral should be advised against taking analgesics containing aspirin or paracetamol. The safety of benorylate has not been established in pregnancy, but there is clinical and epidemiological evidence that salicylate and paracetamol (which occur as meta-

bolic products of benorylate) are safe in human pregnancy.

Overdosage: Symptoms are likely to resemble those caused by salicylate overdosage. Treatment should be based on the levels of salicylate and paracetamol found in the blood.

Side-effects: Overall tolerance is excellent. Adverse effects may include gastric intolerance (nausea, constipation or diarrhoea, indigestion or heartburn) and drowsiness and rashes have also been reported. The possibility that gastro-intestinal haemorrhage may be induced by Benoral cannot be excluded though there is no definite evidence that Benoral was responsible for the gastro-intestinal haemorrhage in the few cases reported. The high salicylate levels obtained with Benoral may give rise to dizziness, tinnitus and deafness. If this happens, the dose should be reduced.

Pharmaceutical precautions No special storage requirements. Use Syrup BP to dilute the suspension.

Legal category P.

Package quantities *Benoral Suspension:* bottles of 150 or 300 ml.

Benoral Tablets: bottles of 100 or 500.

Benoral Granules: Cartons of 60 sachets.

Further information Benoral has analgesic and anti-inflammatory properties comparable to those of other antiarthritis compounds. Its antipyretic effect is similar to that of aspirin or paracetamol but more prolonged than either. Gastro-intestinal tolerance is superior to that of comparable doses of aspirin or mixtures of aspirin and paracetamol.

Benoral Tablets 0071/5901

Benoral Granules 0071/0149

BIOGASTRONE*

Presentation White, flat, round, bevelled-edged tablets 9.6 mm in diameter, marked BG and scored on one side and unmarked on the other. Each tablet contains Carbenoxolone Sodium BP 50 mg.

Uses For the treatment of gastric ulcers.

Dosage and administration For oral administration only. Adults should take 2 tablets three times daily after meals for the first week. Thereafter, 1 tablet should be taken three times a day until the ulcer has healed. For 6 to 8 weeks' treatment is usually needed but up to 12 weeks may be needed in resistant cases.

Contra-indications, warnings, etc

Contra-indications: Biogastone should not be prescribed for patients suffering from severe cardiac, renal and hepatic failure. Nor should it be prescribed for patients on digitalis glycosides unless serum electrolyte levels are monitored at weekly intervals and measure taken to avoid the development of hypokalaemia.

Precautions: Special care should be exercised with patients pre-disposed to sodium and water retention, potassium loss and hypertension (e.g. the elderly and those with cardiac, renal and hepatic disease) since carbenoxolone can induce similar changes.

Potassium supplements should be considered for those at risk from developing hypokalaemia.

Regular monitoring of weight and blood pressure which should indicate the development of such effects is advisable for all patients. A thiazide diuretic should be administered if oedema or hypertension occurs (spironolactone or amiloride should not be used because they interfere with the therapeutic action of carbenoxolone). Potassium loss should be corrected by the administration of potassium supplements.

No teratogenic effects have been reported with carbenoxolone sodium but careful consideration should be given before prescribing Biogastrone for women who may become pregnant.

Overdosage: If the tablets have been recently ingested, the stomach should be emptied by gastric lavage. Serum electrolytes should be monitored and any deficiency in potassium should be corrected, using the intravenous route if necessary, or slow-release or effervescent potassium chloride tablets. Water retention and sodium balance should be corrected by means of a diuretic (spironolactone or amiloride would appear to be a logical choice).

Pharmaceutical precautions Nil.

Legal category POM.

Package quantities Bottles of 100 tablets.

Further information Carbenoxolone has been shown to exert a healing effect on gastric ulcers, possibly by promoting mucus synthesis and by prolonging the life-span of gastric epithelium.

Made under licence from Biorex Laboratories Ltd, London. Brit. Pat. No. 1124976.

Product licence number 0071/5902.

BIORAL GEL*

Presentation A buff-coloured gel containing 2% carbenoxolone Sodium BP.

Uses For the treatment of mouth ulcers.

Dosage and administration Adults and children. Apply thickly to the lesion after meals and at bedtime. The gel should be allowed to remain on the ulcer as long as possible.

Contra-indications, warnings, etc There are no known contra-indications and no side-effects have been reported.

If the lesion is infected, additional appropriate therapy should be used. If the ulcer fails to heal within three weeks, treatment and diagnosis should be reviewed.

Pharmaceutical precautions Tubes should be kept well closed to avoid deterioration.

Legal category P.

Package quantities Tubes containing 5 g.

Further information Bioral Gel contains carbenoxolone sodium in a specially formulated base which adheres to the moist oral mucosa and ensures prolonged contact with the ulcer.

Made under licence from Biorex Laboratories Ltd, London. Brit. Pat. No. 1124976.

Product licence number 0071/5904.

CALCIUM RESONIUM*

Presentation Calcium Resonium is ground and flavoured calcium polystyrene sulphonate and is a yellow to golden brown fine powder with a pleasant vanilla odour and sweet taste. It contains about 8% w/w of calcium.

Uses Calcium Resonium is an ion-exchange resin. It is recommended for the treatment of hyperkalaemia associated with anuria or severe oliguria. It is also used to treat hyperkalaemia in patients requiring dialysis and in patients on regular haemodialysis or on prolonged peritoneal dialysis.

Dosage and administration Calcium Resonium is for oral or rectal administration only. The dosage recommendations detailed below are a guide only; the precise requirements should be decided on the basis of regular serum electrolyte determinations.

Adults:

1. **Oral:** Usual dose 15 g three or four times a day. The resin is given by mouth in a little water, or it may be made into a paste with some sweetened vehicle.

2. **Rectal:** In cases where vomiting may make oral administration difficult the resin may be given rectally as a suspension of 30 g resin in 100 ml 2% methylcellulose (medium viscosity) and 100 ml water, as a daily retention enema. In the initial stages administration by this route as well as orally may help to achieve a more rapid lowering of the serum potassium level.

The enema should if possible be retained for at least nine hours. If both routes are used initially it is probably unnecessary to continue rectal administration once the oral resin has reached the rectum.

Children: 1 g/kg body weight daily in divided doses in acute hyperkalaemia. Dosage may be reduced to 0.5 g/kg body weight daily in divided doses for maintenance therapy.

The resin is given orally, preferably with a drink (not a fruit squash) or a little jam or honey. When refused by mouth it should be given rectally using a dose at least as great as that which would have been given orally.

Contra-indications, warnings, etc

Contra-indications: Calcium Resonium should not be used to treat patients with hyperparathyroidism, multiple myeloma, sarcoidosis or metastatic carcinoma who may present with renal failure and hypercalcaemia.

Precautions: The possibility of severe potassium depletion should be considered, and adequate biochemical control is essential during treatment.

Administration of the resin should be stopped when the serum potassium falls to 5 mmol/litre. Serum calcium levels should be estimated at weekly intervals to detect the early development of hypercalcaemia, and the dose of resin adjusted to levels at which hypercalcaemia and hypokalaemia are prevented.

Overdosage: In the event of overdosage the resin should be removed from the alimentary tract by the use of laxatives or enemas, and appropriate measures should be taken to restore serum potassium levels to normal, and to reduce blood calcium levels if these are raised.

Side-effects: Hypercalcaemia has been reported in well-dialysed patients receiving calcium resin, and in the occasional patient with chronic renal failure. Many patients in chronic renal failure have low serum calcium and high serum phosphate, but some, who cannot be screened out beforehand, show a sudden rise in serum

calcium to high levels after therapy. The risk emphasises the need for adequate biochemical control.

Pharmaceutical precautions It is suggested that Calcium Resonium should not be administered in fruit squashes since these have a high potassium content.

Legal category P.

Package quantities Polystyrene containers of 300 g each containing a plastic 15 g spoon.

Further information Nil.

Product licence number 0071/5025.

DANOL*

Presentation

1. *Danol*: white No. 1 hard gelatin capsules printed in black ink with an identification mark and D200 and filled with a white or almost white powder containing 200 mg danazol.

2. *Danol-½ (Half Strength)*: white No. 3 hard gelatin capsules printed in black ink with an identification mark and D100 and filled with a white or almost white powder containing 100 mg danazol.

Uses Danol is recommended for the treatment of endometriosis and associated infertility, benign breast disease (e.g. fibrocystic mastitis) and menorrhagia. Danol has also been used to treat virginal breast hypertrophy, primary constitutional precocious puberty, gynaecomastia and other similar endocrine disorders where regulation of the release of pituitary gonadotrophins LH and FSH would be of therapeutic value.

Dosage and administration Danol is for oral administration only. Dosage depends on the condition being treated and the patient's response and, for adults, is usually within the range of 200–800 mg daily in two to four divided doses. The effect of Danol is a function of dosage and time and therefore in some patients, once a satisfactory response has been obtained, it may be possible to maintain improvement with a reduced dose. It is recommended that Danol therapy in adult females should start on the first day of the menstrual cycle with an adjustment of dosage being made subsequently to achieve amenorrhoea when desired. Further adjustments may be made in succeeding months consistent with the patient's response.

1. *Adults*: In endometriosis it is recommended that a starting dose of 400 mg daily be used, reducing or increasing as necessary. Treatment should be continued for six months or until the condition resolves.

In benign breast disorders, a starting dose of 300 mg daily in divided doses is recommended.

In menorrhagia, daily doses of 100–400 mg have been found effective but 200 mg daily is usually sufficient to reduce menstrual blood loss to acceptable levels.

2. *Children*: The recommended dose in precocious puberty is 100–400 mg daily, depending on the patient's age, weight and clinical response.

Contra-indications, warnings, etc

Contra-indications: Although no teratogenic effects have been observed in animal studies, it is recommended that Danol should not be given to patients who are pregnant. In patients with amenorrhoea before treatment, tests should be considered to establish that they are not pregnant. Administration should be stopped if a patient is found to be pregnant after starting a course of

treatment. Continuing treatment may result in an androgenic effect on the foetus.

Precautions: Contraception: Although Danol can inhibit ovulation, it must not be relied upon for contraceptive and non-hormonal methods should be advised during the course of treatment. This is because the concurrent administration of oestrogens and/or progestogens, including oral contraceptives may modify the action of Danol.

Because Danol may cause some degree of fluid retention, patients with conditions which may be influenced by this factor, such as cardiac or renal dysfunction, epilepsy or migraine, require careful observation.

Danol does not appear to have any adverse effect on the liver, nevertheless, since the compound is metabolised in the liver, care is needed in patients with hepatic dysfunction.

Care is needed in patients with diabetes mellitus because Danol may increase insulin resistance and thus aggravate the condition.

Danol may potentiate the action of anticoagulants.

Overdosage: In animal tests, doses of 16,000 mg/l body weight produced no fatalities, and it is unlikely that any immediate serious reactions would be seen from a single excessive dose in man.

In the case of acute overdosage, the drug should be removed by emesis or stomach pump (if ingestion recent) and the patient should be kept under observation in case of any delayed reactions.

Side Effects: Danol administration has had little overall effect on libido and no episodes of deep-vein thrombosis; nor any thrombo-embolic complications have been attributed to the drug.

Acne, oily-skin, fluid retention, mild hirsutism and rarely, clitoral hypertrophy, all of which can be attributed to the mild androgenic activity of Danol, have been reported on occasions, particularly in patients where such tendencies were already present. Flushing and reduction in breast size have also been noted. If signs of virilisation (e.g. voice changes) develop, Danol should be discontinued.

Other adverse reactions which have been reported include rashes, nervousness and nausea, headache, dizziness, vertigo, emotional lability, backache, skeletal muscle spasm and hair loss.

An increase in overall weight in some patients has been recorded during Danol treatment. This was considered to be associated with its mild anabolic activity. Increases greater than 4 or 5 kg (10 lbs), however, were not common and tended to be associated with high doses and longer periods of treatment. Control of diet may be beneficial in some susceptible patients.

In long-term high-dosage toxicity studies in the rhesus monkey, although no change was seen in the activity of the drug-metabolising enzymes, azoreductase and nitroanisole O-demethylase, a decrease was observed in aminopyrine N-demethylase and aniline hydroxylase.

Pharmaceutical precautions Nil.

Legal category POM.

Package quantities Danol capsules are supplied in bottles of 50 and 100.

Danol-½ (Half Strength) capsules are supplied in bottles of 50 and 100.

Further information The effect of Danol on the hypothalamic-pituitary-gonadal axis is reversible when treatment is stopped. In those patients who have

received after treatment, there is no evidence to suggest that the compound has any effect on the course or outcome of pregnancy. There is no clinical or oratory evidence that Danol affects other pituitary-thyroid axes. It should be noted, however, that while T_4 levels are unaffected by Danol, some patients who clinically euthyroid may show increased T_3 uptake, increased T_4 levels, and a decrease in thyroxine binding protein.

Product licence numbers

100 mg	0071/0095
50 mg (Half Strength)	0071/0094

DUOGASTRONE*

Presentation Colourless, transparent, unmarked position-release capsules filled with a white powder. Each contains 50 mg Carbenoxolone Sodium BP.

Uses For the treatment of duodenal ulcers.

Dosage and administration *Adults:* One capsule to be swallowed whole and unbroken with liquid, four times daily, 15–30 minutes before meals. Patients taking antacids should continue to do so until symptoms appear but anticholinergic drugs should be discontinued. Despite early relief of symptoms, treatment should continue for at least six weeks and should usually be continued to 12 weeks to ensure maximum healing effect.

Contra-indications, warnings, etc

Contra-indications: Duogastrone should not be prescribed for patients suffering from severe cardiac, renal or hepatic failure. Nor should it be given to patients on digitalis glycosides unless serum electrolyte levels are monitored at weekly intervals, and measures taken to avoid the development of hypokalaemia.

Precautions: Special care should be exercised with patients predisposed to sodium and water retention, potassium loss and hypertension (e.g. the elderly and those with cardiac, renal or hepatic disease) since carbenoxolone can induce similar changes. Potassium supplements should be considered for those at risk from developing hypokalaemia.

Regular monitoring of weight and blood pressure which should indicate the development of such effects is advisable for all patients. A thiazide diuretic should be administered if oedema or hypertension occurs (spironolactone or amiloride should not be used because they interfere with the therapeutic action of carbenoxolone). Potassium loss should be corrected by the administration of potassium supplements.

No teratogenic effects have been reported with carbenoxolone sodium but careful consideration should be given before prescribing Duogastrone for women who may become pregnant.

Overdosage: If the capsules have been recently ingested, the stomach should be emptied by gastric lavage. Serum electrolytes should be monitored and any deficiency in potassium should be corrected, using the intravenous route if necessary, or slow-release or effervescent tablets of potassium chloride. Water retention and sodium imbalance should be corrected by means of a diuretic. Spironolactone or amiloride would appear to be a logical choice.

Pharmaceutical precautions Care should be taken not to damage the capsules. Store in a cool, dry place.

Legal category POM.

Package quantities Containers of 28 capsules.

Further information Duogastrone is a unique 'position-release' capsule designed to deliver carbenoxolone sodium into the duodenum. The capsule contents are released only when it is ruptured by the pressure of the antral or pyloric contractions. Carbenoxolone sodium exerts a local healing effect on the ulcer possibly by improving mucus synthesis and by prolonging the life span of epithelium cells of the duodenum.

Made under licence from Biorex Laboratories Ltd, London. Brit Pat. No. 1093286.

Product licence number 0071/5903.

EUMYDRIN*

Presentation Eumydrin is a clear, colourless solution containing 0.6% w/v Atropine Methonitrate BP in ethyl alcohol.

Uses Eumydrin is recommended for the treatment of pylorospasm in infants and congenital hypertrophic pyloric stenosis. Eumydrin drops are also used in the symptomatic alleviation of the paroxysms of whooping cough, and certain types of dry spasmodic cough.

Dosage and administration Eumydrin drops are for oral administration only. To ensure correct dosage, Eumydrin should be dispensed from the dropper provided in each pack. Each drop then contains approximately 0.2 mg atropine methonitrate.

Adults: The usual dosage is 5–15 drops (1–3 mg).

Children: In the treatment of pyloric stenosis it is important that dehydration and alkalosis should be treated before Eumydrin is given. Usually 1–2 drops are given 20 minutes before each feed, and this dose may be increased to 3 or 4 drops after several days. Feeds are usually given every two hours in gradually increasing amounts. Treatment is usually continued for nine weeks or so, the patient usually being discharged from hospital after two weeks. Subsequently the dose of Eumydrin is gradually decreased until administration ceases.

In the treatment of whooping cough the dose depends on the age of the child and the severity of the attack. The following scheme serves as a guide, the doses being repeated every four hours:

6–10 years and over	6–12 drops
2–6 years	4–8 drops
6 months to 2 years	3–6 drops
Infants up to 6 months	2–4 drops

The lower dose should be used first and increased to the higher one if necessary. The drops may be given in water or fruit juice, or they may be put on a lump of sugar and allowed to evaporate. When vomiting is troublesome or a rapid action is needed, the drops may be placed directly on the tongue.

If side-effects such as dryness of the mouth, dilation of the pupils or 'lobster' skin occur, the dose should be reduced.

Contra-indications, warnings, etc

Contra-indications: Eumydrin should not be given to patients known to be hypersensitive to anticholinergics or to those with paralytic ileus, prostatic enlargement, closed angle glaucoma or those with a shallow anterior chamber.

Precautions: Because of the possibility of hyperpyrexia in abnormally sensitive patients, care is needed in the use of Eumydrin or any other atropine derivatives where there is a preexisting cause of fever, such as upper

respiratory infection. It should be noted that the solvent in Eumydrin drops is 90% alcohol, they must not therefore be used for the eyes.

Eumydrin should be used with caution in conditions characterised by tachycardia. Concurrent administration of certain drugs with anticholinergic properties, such as amantidine, some antihistamines, butyrophenones, phenothiazines, and tricyclic antidepressants may enhance the action of Eumydrin.

Overdosage: Signs and symptoms of overdosage are the same as for atropine. Symptomatic treatment consists of sponging and cold packs for fever, paraldehyde intramuscularly for excitement or convulsions, and oxygen and artificial respiration for the depressed state. Neostigmine, physostigmine or pilocarpine may be used as antidotes.

Side-effects: These resemble those seen with atropine (e.g. dry mouth, dysphagia, thirst, dry skin, dilated pupils, fever, increased pulse and respiration rate, etc), though atropine methonitrate has a weaker stimulant effect on the central nervous system. It is well tolerated by infants and considerable overdosage is necessary before toxic symptoms appear.

Pharmaceutical precautions Because of the volatile nature of the solvent Eumydrin should be stored in a cool place and the bottles should be tightly closed. If evaporation occurs during storage the solution should not be used because of the risk of overdosage.

Legal category POM.

Package quantities Amber glass bottles containing 15 ml complete with dropper.

Further information Nil.

Product licence number 0071/5029.

EVIDORM®

Presentation Evidorm Tablets are near-white bi-convex tablets 11 mm in diameter, marked E on one face and scored on the other. Each tablet contains 250 mg hexobarbitone and 100 mg Cyclobarbitone Calcium BP.

Uses Evidorm Tablets are recommended for the treatment of severe, intractable insomnia.

Dosage and administration Evidorm Tablets are for oral administration only.

Adults: 1 tablet on retiring; 2 tablets may be needed occasionally.

Contra-indications, warnings, etc

Contra-indications: Barbiturate hypnotics should not be used in children, young adults, the elderly or in patients who are debilitated, or in those who have a history of alcohol or drug abuse. They are also contra-indicated in the presence of uncontrolled pain, pregnancy or breast feeding and porphyria.

Precautions: In patients with renal or hepatic failure, the dose should be reduced. Because barbiturates can increase the activity of hepatic enzymes involved in drug metabolism, the availability and blood concentration of concurrently administered drugs may be altered. Among the compounds known to be affected are coumarin-type anticoagulants, systemic steroids (including oral contraceptives), phenytoin, griseofulvin, rifampicin, phenothiazines and tricyclic antidepressants.

Overdosage: Where patients are seen within four hours

of taking an overdose, gastric aspiration or lavage may be beneficial in adults, while children who are conscious may be given an emetic, e.g. Syrup of Ipecacuanha.

The prime objective in treating barbiturate overdosage is to maintain vital functions (respiration, cardiovascular and renal function and electrolyte balance) while the majority of the drug is metabolised by hepatic enzymes. At the same time some of the drug is excreted unchanged by the kidneys. Given normal renal function, this latter process may be enhanced by alkaline diuresis, maintaining the urinary pH at about 8 by appropriate intravenous infusion. In severe cases, haemodialysis may help, but extracorporeal haemoperfusion is probably more effective.

Side Effects: Drowsiness, sedation, unsteadiness, vertigo and inco-ordination may occur. During the first week of administration, performance and alertness may be impaired; patients should be warned not to drive or operate machinery if affected. These effects may be potentiated by alcohol.

Other adverse reactions may include a 'hang-over' effect, paradoxical excitement, confusion, memory defects and skin rashes in patients who may be sensitive to this type of drug.

Pharmaceutical precautions Nil.

Legal category POM.

Package quantities Evidorm is supplied in bottles of 50 tablets.

Further information Barbiturates have a high addiction potential. Long-term use or use of high doses for short periods may lead to tolerance and subsequently physical and psychological dependence. Symptoms of dependence include confusion, defective judgement and loss of emotional control. Withdrawal symptoms occur after long-term normal use (and particularly after abuse) if barbiturate treatment is stopped abruptly. They include nightmares, irritability and insomnia and, in severe cases, tremors, delirium, convulsions and death. Withdrawal symptoms have been reported in neonates after barbiturate treatment during pregnancy and labour.

Product licence number 0071/5030.

FERGON®

Presentation Fergon Tablets are smoothly polished red, sugar-coated tablets with no markings, each containing 300 mg Ferrous Gluconate BP.

Uses Fergon Tablets are recommended for the treatment of hypochromic anaemia caused by deficient iron intake, excessive iron loss as in menorrhagia, or chronic bleeding from the gastro-intestinal tract. They are also used as a supplement during pregnancy, in idiopathic hypochromic anaemia and in the treatment of iron deficiency in childhood.

Dosage and administration Fergon is for oral administration. It is best administered about one hour before meals.

Adults Prophylactic: 2 tablets (600 mg, daily).

Therapeutic: 4-6 tablets (1.2-1.8 g) daily in divided doses.

Children: Children aged 6-12 years may be given 1-2 tablets daily for therapeutic or prophylactic purposes.

Contra-indications, warnings, etc There are no

recorded contra-indications to Fergon but it should be used with caution in patients with haemochromatosis or aemolytic anaemia.

Patients should be warned to keep Fergon Tablets out of the reach of young children. The absorption of iron salts is decreased in the presence of antacids. They will also diminish the absorption of concurrently administered tetracyclines.

Overdosage: It is well known that overdosage of ferrous salts is particularly dangerous to small children.

The following treatment is suggested. Gastric lavage with 5% sodium bicarbonate and saline cathartics (e.g. sodium sulphate 30 g for adults). Milk and eggs with 5 gismuth carbonate every hour as demulcents. Blood or plasma transfusion for shock, oxygen for respiratory embarrassment. Chelating agents such as disodium alium edetate may be tried (500 mg in 500 ml by continuous i.v. infusion). Dimercaprol should not be used since it forms a toxic complex with iron. Desferrioxime is a specific iron chelating agent.

Side-effects: are mainly gastro-intestinal. They appear to occur less frequently than with ferrous sulphate, and patients are therefore less likely to default during treatment.

Pharmaceutical precautions Store in well-closed containers. Protect from light.

Legal category P.

Package quantities Fergon is supplied in bottles of 10 or 100 tablets.

Further information Nil.

Product licence number 0071/5032.

FORTAGESIC®

Presentation White tablets 12.7 mm diameter, marked with an ankh on one side and Fortagesic on the other. Each tablet contains Pentazocine BP 15 mg (as the hydrochloride) and Paracetamol BP 500 mg.

Uses Fortagesic is a compound analgesic for the relief of moderate pain associated with musculo-skeletal disorders or injuries, such as bursitis, sprains, strains, bronchitis, sciatica and osteoarthritis, and for rheumatoid arthritis in patients sensitive to aspirin.

Dosage and administration Fortagesic is for oral administration only.

Adults: 2 tablets up to four times daily.

Children: 7-12 years: 1 tablet not more frequently than every four hours. Not more than 4 doses to be taken in any 24-hour period. Not recommended for children under 7 years of age.

Contra-indications, warnings, etc

Precautions: Fortagesic should not be administered to patients with established respiratory depression, raised intracranial pressure, head injuries or pathological brain conditions where clouding of the sensorium is undesirable.

Because pentazocine is a narcotic antagonist, Fortagesic may provoke withdrawal symptoms if given to narcotic addicts and it should be given with caution to patients who have recently been treated with large doses of narcotics.

Fortagesic may produce sedation so ambulant patients should be warned not to operate machinery or drive if

affected: alcohol may reinforce the sedative effect. There is epidemiological evidence for the safety of paracetamol in human pregnancy. No such evidence exists for pentazocine but it has been widely used for many years without apparent ill consequences. When it is prescribed for chronic use, the physician should take precautions to avoid unnecessary increase in dose of Fortagesic by the patient. Fortagesic should be used with caution in patients who are receiving monoamine oxidase inhibitors, and in those with severe renal, hepatic or respiratory impairment.

Overdosage: In the absence of any experience of overdosage with Fortagesic it is reasonable to assume that signs and symptoms would resemble those which may occur after excessive amounts of the individual ingredients.

Means of maintaining proper oxygenation should be available and naloxone should be used to reverse any CNS depression.

Patients who have taken an overdose of paracetamol may appear well for the first three days, then succumb with liver damage. The hepatic changes produced by overdosage of paracetamol appear to result from the accumulation of a highly active intermediate metabolite in the hepatocytes. N-acetylcysteine intravenously or l-methionine orally protects the liver if administered within 10 hours of ingesting an overdose.

Side-effects: are more likely to be due to pentazocine than to paracetamol, for adverse reactions to this latter compound are uncommon and it is without any irritant effect on the gastro-intestinal tract. The reactions to the oral administration of pentazocine which have sometimes occurred include dizziness, nausea, vomiting, headache and sedation. These effects have been self-limiting and tend to decrease after the first few doses. Less frequent reactions have included sweating, psychotomimetic effects and flushing.

Pharmaceutical precautions Nil.

Legal category POM.

Package quantities Fortagesic is supplied in bottles of 100 and 500 tablets.

Further information Fortagesic is a logical combination of two analgesics, one (paracetamol) acting peripherally, the other (pentazocine) exerting a central action. They are presented in a ratio which has been found effective for the relief of moderate pain.

Product licence number 0071/0022.

FORTRAL®

Presentation

1. A sterile, isotonic aqueous solution for intramuscular, intravenous or subcutaneous injection containing Pentazocine BP 30 mg/ml as the lactate in 1 ml or 2 ml ampoules.

2. No. 4 hard gelatine, grey/yellow capsules marked Fortral 50. Each capsule contains Pentazocine Hydrochloride BP 50 mg (equivalent to 44.3 mg base).

3. White, torpedo-shaped suppositories, average weight 1.86 g, for rectal administration. Each suppository contains Pentazocine BP 50 mg as the lactate.

4. White, bi-convex film-coated tablets, 9.5 mm diameter, marked Fortral on one face and with an ankh on the other. Each tablet contains Pentazocine Hydrochloride BP 25 mg (equivalent to 22.15 mg base).

Uses Fortral is a strong analgesic for the relief of moderate to severe pain.

Dosage and administration

1. Fortral Ampoules: Adults: Fortral injections may be administered subcutaneously, intramuscularly or intravenously. For severe pain, 45–60 mg. For moderate pain, 30 mg. The dose should be adjusted according to response and repeated as necessary every three to four hours.

Children: In the case of patients between the ages of 1 year and 12 years, the *maximum* single dose of parenteral Fortral should be calculated on the basis of 1 mg/kg body weight by subcutaneous or intramuscular injection or 0.5 mg/kg body weight intravenously.

As with most parenteral drugs, when frequent daily injections are needed over long periods, intramuscular administration is preferable to subcutaneous. It is recommended that intramuscular sites of injection be rotated, e.g. deltoid areas, upper outer quadrants of the buttocks and mid-lateral aspects of the thighs.

2. Fortral Capsules: Adults: The usual recommended dosage is one to two 50 mg capsules every three to four hours after meals according to the response of the patient. Dosage is best tailored to the individual patient and to the degree of pain.

Children: For children under 12 years of age, it is recommended that other dosage forms of Fortral, tablets or injection, be used as appropriate.

3. Fortral Suppositories: Adults: 1 suppository at any one time. It will not normally be necessary to exceed 4 suppositories daily.

Children: Fortral Suppositories are not suitable for administration to children under 12 years of age.

4. Fortral Tablets: Adults: The usual starting dose is two 25 mg tablets every four hours after meals, but dosage is best tailored to the individual patient and to the degree of pain within the range of 25–100 mg every three to four hours.

Children: 6–12 years: One 25 mg tablet every three to four hours as required.

1–6 years: The recommended dosage is such that Fortral injection is considered to be a more convenient dosage form.

Under 1 year: There are no dosage recommendations for children less than 1 year old.

Contra-indications, warnings, etc

Precautions: Fortral should not be administered to patients with established respiratory depression, raised intracranial pressure, head injuries or pathological brain conditions, where clouding of the sensorium is undesirable.

Because pentazocine is a narcotic antagonist, it may provoke withdrawal symptoms if given to narcotic addicts.

Fortral should be given with caution to patients with severely impaired renal or hepatic function and to those previously on large doses of narcotics. Fortral may produce sedation, so ambulant patients should be warned not to operate machinery or drive if affected; alcohol may reinforce the sedative effect. There is no epidemiological evidence for the safety of pentazocine in human pregnancy but it has been widely used for many years without apparent ill consequences. When Fortral is prescribed for chronic use, the physician should take precautions to avoid any unnecessary increase in

dose by the patient. Until further information is available Fortral, like most other strong analgesics, should be used with caution in patients who are receiving monoamine oxidase inhibitors.

Overdosage: Means of maintaining proper oxygenation should be available, and naloxone should be used to reverse any CNS depression.

Side-effects: No serious toxic reactions have been observed where Fortral has been given in normal therapeutic doses and side-effects are generally of a minor nature. Sedation, the most common effect, is less than that associated with morphine. Nausea, vertigo, vomiting, diaphoresis, skin flushes and visual disturbances have also been reported. Respiratory depression, though not normally of clinical significance, can occur.

The psychotomimetic effects observed with nalorphine and other narcotic antagonists occur sometimes with Fortral. Local tissue damage at injection sites has been reported, particularly after subcutaneous administration.

Dependence liability: Abrupt discontinuation of Fortral in patients receiving large parenteral doses over a prolonged period has occasionally resulted in mild withdrawal symptoms. There have also been rare reports of a similar effect in the new-born after prolonged maternal use of Fortral during pregnancy. This abstinence syndrome of Fortral is not typical of opiate dependence. Symptoms include mild abdominal cramps, nausea, vomiting, nervousness or restlessness, dizziness, fever and chills, but are mild compared with opiate withdrawal symptoms. Withdrawal of Fortral from such patients has raised few problems, treatment with tranquillisers only being sometimes required. It should be emphasised that the majority of patients reported to have become dependent on Fortral had previously been dependent on opiates or had misused other drugs.

Pharmaceutical precautions Fortral Suppositories should be stored in a cool place and the ampoules should be protected from light. Fortral is chemically compatible with atropine sulphate, hyoscine hydrobromide and promethazine hydrochloride. Precipitation will occur if Fortral injection is mixed in the same syringe with soluble barbiturates, diazepam or with chlordiazepoxide. Fortral injection appears to be compatible for up to seven days with most commonly used infusion solutions. The exceptions are those which contain sodium bicarbonate, where the high pH causes immediate precipitation of pentazocine base.

Legal category POM.

Package quantities

1. Ampoules in boxes of ten 1 ml or 2 ml.
2. Capsules in bottles of 100 or 500.
3. Suppositories in cellulose acetate strips. Boxes of 20.
4. Tablets in bottles of 100 or 500.

Further information Fortral is a strong analgesic with weak narcotic antagonist properties. In action it is comparable to morphine and other narcotics. It is not subject to the Misuse of Drugs Act.

FRANOL*

Presentation Franol Tablets are flat, white tablets with bevelled edges, 8.7 mm in diameter, marked F on one side and plain on the other side. Each tablet contains 120 mg Theophylline BP, 8 mg Phenobarbitone BP and 1 mg Ephedrine Hydrochloride BP.

Uses Franol Tablets are recommended for the treatment of bronchial asthma and bronchitis.

Dosage and administration Franol Tablets are for oral administration only.

Adults:

1. *Bronchial asthma:* Dosage varies with individual requirements and should be adjusted accordingly. The usual dosage is 3 tablets a day (morning, midday and evening). For the patient who suffers nocturnal attacks, an extra tablet taken at bedtime is recommended.

In order to avoid recurrences, it is important that treatment should be continued for a considerable time after attacks have stopped.

2. *Bronchitis:* Usual dosage 3 tablets a day. This may be increased if necessary.

Children: The usual dose is one-third to one-half the adult dose, though full doses may be used should these be needed. The dose will depend on the severity of the condition, on individual tolerance and on the response obtained.

Contra-indications, warnings, etc Franol should not be given to patients with acute intermittent porphyria or to those who are hypersensitive or exhibit idiosyncrasy to barbiturates.

It should not be given to those who are taking MAO inhibitors or have received them during the previous 14 days. Franol should not normally be given during pregnancy or lactation and it should be used with caution in patients with cardiovascular disease, severe hypertension, hyperthyroidism, prostatic hypertrophy or glaucoma.

Overdosage: The symptoms of overdosage are likely to be those attributable to ephedrine and include excessive irritability, fever, nausea and vomiting, cyanosis, tachycardia, dilated pupils, opisthotonus, spasm, convulsion and respiratory embarrassment. If recently ingested and vomiting (due to the theophylline) has not occurred, the stomach should be emptied. Subsequent treatment should be symptomatic.

Side-effects: These are rare. The phenobarbitone in the formula will usually overcome any stimulation due to the ephedrine. Any minor gastric disturbances can be avoided by taking the tablets with meals.

Pharmaceutical precautions Nil.

Legal category POM.

Package quantities Franol Tablets are supplied in bottles of 100, 500 and 1,000.

Further information Nil.

Product licence number 0071/5036.

FRANOL* EXPECT.

Presentation Franol Expect. is a clear, deep red, viscous solution with an odour of aniseed. Each 10 ml dose contains 120 mg Theophylline (equivalent to 130 mg Theophylline Hydrate BP), BP, 8 mg Phenobar-

bitone BP, 9.5 mg Ephedrine BP and 50 mg guaiphenesin.

Uses Franol Expect. is recommended for the treatment of chronic bronchitis, bronchial asthma associated with productive bronchitis, and coughs associated with tracheobronchitis and influenza.

Dosage and administration Franol Expect. is for oral administration only. Dosage depends on individual needs and tolerance.

Adults: 10 ml (2 × 5 ml spoonfuls) three times a day, with an additional dose before retiring, if required.

Children: The usual dose is one-third to one-half the adult dose, though older children will tolerate full doses, should these be needed.

Contra-indications, warnings, etc Franol Expect. should not be given to patients with acute intermittent porphyria or to those who are hypersensitive or exhibit idiosyncrasy to barbiturates.

It should not be given to those who are taking MAO inhibitors or have received them during the previous 14 days. Franol should not normally be given during pregnancy or lactation and it should be used with caution in patients with cardiovascular disease, severe hypertension, hyperthyroidism, prostatic hypertrophy or glaucoma.

Overdosage: The symptoms of overdosage are likely to be those attributable to ephedrine and include excessive irritability, fever, nausea and vomiting, cyanosis, tachycardia, dilated pupils, opisthotonus, spasm, convulsions and respiratory embarrassment. If recently ingested and vomiting (due to the theophylline) has not occurred, the stomach should be emptied. Subsequent treatment should be symptomatic.

Side-effects: These are rare. The phenobarbitone in the formula will usually overcome any stimulation due to the ephedrine. Minor gastric disturbances can be overcome by taking the dose with meals.

Pharmaceutical precautions When doses of less than 5 ml are ordered Franol Expect. may be diluted with Syrup BP. A 50:50 dilution is stable for at least two to three weeks.

Legal category POM.

Package quantities Franol Expect. is supplied in bottles containing 150 ml or 1 litre.

Further information Nil.

Product licence number 0071/5038.

FRANOL* PLUS

Presentation Franol Plus Tablets are flat, white tablets with bevelled edges, 8.7 mm in diameter, marked F+ on one side and W on the other. Each tablet contains 120 mg Theophylline BP, 8 mg Phenobarbitone BP, 15 mg ephedrine sulphate and 10 mg phenylephrine hydrochloride.

Uses Franol Plus Tablets are recommended for the treatment of asthma and bronchitis, especially where exacerbated by allergy and hay fever.

Dosage and administration **Adults:**

1. *Bronchial asthma:* Dosage varies with individual requirements and should be adjusted accordingly. The usual dosage is 3 tablets a day (morning, midday and

evening). For the patient who suffers from nocturnal attacks, an extra tablet taken at bedtime is recommended.

In order to avoid recurrences, it is important that treatment should be continued for a considerable time after attacks have stopped.

2. *Bronchitis*: Usual dosage 3 tablets a day. This may be increased if necessary.

3. *Hay fever*: 1 tablet three times a day.

Children: The usual dose is one-third to one-half the adult dose, though full doses may be used should these be needed. The dose will depend on the severity of the condition, on individual tolerance and on the response obtained.

Contra-indications, warnings, etc Franol should not be given to patients with acute intermittent porphyria or to those who are hypersensitive or exhibit idiosyncrasy to barbiturates.

It should not be given to those who are taking MAO inhibitors or have received them during the previous 14 days. Franol should not normally be given during pregnancy or lactation and it should be used with caution in patients with cardiovascular disease, severe hypertension, hyperthyroidism, prostatic hypertrophy or glaucoma.

Overdosage: The symptoms of overdosage are likely to be those attributable to ephedrine and include excessive irritability, fever, nausea and vomiting, cyanosis, tachycardia, dilated pupils, opisthotonus, spasm, convulsions and respiratory embarrassment. If recently ingested and vomiting (due to the theophylline) has not occurred, the stomach should be emptied. Subsequent treatment should be symptomatic.

Side-effects: These are rare, any minor gastric disturbances can be avoided by taking the tablets with meals. The principal side-effects of theophylline when used alone is sedation, but in Franol Plus, this effect is counteracted by the increased dose of ephedrine.

Pharmaceutical precautions Nil.

Legal category POM.

Package quantities Franol Plus is supplied in bottles of 50 and 250 tablets.

Further information Franol Plus consists of the Franol formulation with the addition of the antihistamine theophylline hydrochloride and an increased dose of ephedrine.

Product licence number 0071/5037.

GLURENORM*

Presentation Flat, white, bevelled-edged tablets, 9 mm in diameter, scored on one side and with G on the other, each containing 30 mg gliquidone.

Uses For the treatment of maturity-onset diabetes, including those with impaired renal function, who do not respond adequately to dietary control.

Dosage and administration Glurenorm should be taken up to half an hour before a meal. The daily dose should be adjusted according to the patient's metabolic state, and the frequency of administration may be varied to obtain the best possible control of the diabetes throughout the day. Most patients respond to a total daily dose of 45–60 mg given in two or three divided doses, of which the largest dose is usually taken in the

morning with breakfast. The recommended maximum single dose is 60 mg (2 tablets) and the maximum daily dose 180 mg (6 tablets).

During stabilisation, dosage adjustment should be based on frequent blood and urinary sugar determinations.

Stabilisation of previously untreated cases: Optimum control is usually obtained with divided doses spaced by reference to diet, normal daily activities of the patient and the daily blood-sugar profile. Normally, treatment should begin with 15 mg (half a tablet) before breakfast and this should be gradually increased by 15 mg increments. It should be noted that increasing the single dose beyond 60 mg or the daily dose beyond 120 mg produces little additional improvement in the blood-sugar levels of most patients.

Change-over in patients previously treated with other oral anti-diabetic agents: Patients can be changed over from other sulphonylureas to Glurenorm without interruption. It is usual to start with 30 mg Glurenorm increasing as necessary by increments of 15 mg. An estimate of the likely dose for each patient can be made from their original regimens because, in terms of potency 30 mg Glurenorm corresponds approximately to 1,000 mg tolbutamide, 5 mg glibenclamide, 1,000 mg glymidine, 250 mg tolazamide, 250 mg chlorpropamide or 500 mg acetohexamide. Note that chlorpropamide has a much longer half-life than Glurenorm.

Change-over in maturity-onset diabetics previously treated with insulin: In patients treated with up to 30 i.u. of insulin daily, change-over to Glurenorm may be attempted with an initial dose of 30 mg accompanied by a simultaneous gradual reduction of the amount of insulin, provided the pancreas still contains some functioning β cells. Patients who change from insulin to Glurenorm should be strictly supervised and response assessed by frequent and regular blood-sugar determinations.

It may be possible to reduce the insulin requirements of patients who require more than 30 i.u. daily by the concurrent administration of Glurenorm. Blood-sugar should be monitored frequently during the change-over period.

Combined treatment: The administration of a biguanide with Glurenorm to patients who cannot be adequately controlled by Glurenorm alone will often achieve satisfactory stabilisation of blood-sugar levels.

Contra-indications, warnings, etc Glurenorm should not be used to replace insulin in insulin-dependent (juvenile) diabetics.

Patients subject to the stress of surgery or acute infections should be temporarily transferred to insulin. It will also be easier to control blood-sugar with insulin during pregnancy and in patients with severe hepatic or renal failure.

Patients who miss a meal (particularly the elderly or debilitated) should be warned not to take their dose of Glurenorm, in order to reduce the risk of a hypoglycaemic reaction.

The effect of Glurenorm may be increased by physical exertion, alcohol, salicylates, sulphonamides, phenylbutazone, ethionamide, coumarin anticoagulants, chloramphenicol, tetracyclines, cyclophosphamide, MAO inhibitors and β -adrenergic blocking agents.

It may be necessary to increase the dose of Glurenorm when any of the following are administered concurrently: oral contraceptives, chlorpromazine, sympathomimetic

agents, corticosteroids, thyroid hormones and nicotinic acid preparations.

The effect of barbiturates, vasopressin and oral anti-coagulants are potentiated by the administration of Glurenorm.

Side-effects: Glurenorm is well tolerated. There have been some reports of minor skin allergies, gastric upsets and other non-specific side-effects. Reversible leucopenia has been reported on one occasion and reversible thrombocytopenia twice, but a causal connection with Glurenorm was not established.

Hypoglycaemic reactions are infrequent, but should they occur, they may be treated with oral carbohydrate, or with intravenous dextrose if the oral route is impractical. Glucagon (1 mg subcutaneously) could also be given.

Pharmaceutical precautions Nil.

Legal category POM.

Package quantities Bottles of 100 tablets.

Further information Glurenorm is a sulphonylurea hypoglycaemic agent which is rapidly absorbed, its action starts within one hour and its optimum effect lasts two to three hours. It is almost completely metabolised in the liver by hydroxylation and demethylation. Only 5% of the pharmacologically inactive metabolites is excreted by the kidneys, the remainder is eliminated in the faeces via the bile. There is thus little risk of hypoglycaemia due to drug accumulation in patients with impaired renal function.

Product licence number 0071/0155.

HAYPHRYN* NASAL SPRAY

Presentation Hayphryn Nasal Spray is a clear, colourless solution containing 0.5% w/v Phenylephrine Hydrochloride BP and 0.1% w/v phenyldiamine hydrochloride in a plastic spray bottle presentation. The solution has a faint odour and foams when shaken.

Uses Hayphryn Nasal Spray is recommended for the relief of nasal congestion in such conditions as the common cold, sinusitis and vasomotor rhinitis, particularly when an allergic factor is present as, for example, in hay fever and allergic rhinitis.

Dosage and administration For nasal administration only.

Adults: The tip of the atomiser should be inserted into each nostril in turn and the container squeezed twice, sharply, as the patient breathes in. The application may be repeated in three to four hours if necessary.

Children: For children the product may be administered as for adults, except that the container is squeezed once only into each nostril.

Contra-indications, warnings, etc Because it contains a sympathomimetic amine. Hayphryn Nasal Spray should not be used by patients taking monoamine oxidase inhibitors and it should be used with caution by patients taking β -adrenergic blocking agents. Hayphryn Nasal Spray should not be used for longer than three weeks, and should not be used for chronic nasal congestion.

Excessive or too prolonged use of Hayphryn Nasal Spray may lead to secondary congestion. Oral overdosage is unlikely to be a problem since the quantities of

active ingredients in each spray are insufficient to cause any serious reaction.

Adverse effects are uncommon when the spray is used as recommended.

Pharmaceutical precautions Nil.

Legal category P.

Package quantities Plastic spray bottles containing 15 ml.

Further information Nil.

Product licence number 0071/5041.

HEXOPAL* TABLETS AND SUSPENSION

Presentation 1. Hexopal Suspension is a smooth white fluid with a sweet odour and taste, which contains Inositol Nicotinate BP 1,000 mg in each 5 ml.

2. Hexopal Tablets are white or almost white, flat tablets with bevelled edges, 12.7 mm in diameter, marked with a symbol on one side and scored on the other. Each tablet contains 500 mg Inositol Nicotinate BP.

Uses Hexopal is recommended for the symptomatic treatment of conditions arising from arterial insufficiency, such as intermittent claudication, and in peripheral and cerebral arteriosclerosis.

It is also recommended for the treatment of vasospastic conditions including chilblains, primary and secondary Raynaud's phenomenon, night cramps, restless legs, acrocyanosis and erythrocyanosis, and other conditions where a peripheral vasodilator is required.

Dosage and administration For oral administration only.

Adults: In the symptomatic treatment of conditions arising from arterial insufficiency, such as intermittent claudication, and in peripheral and cerebral arteriosclerosis, the usual starting dose is 1 g three times a day (i.e. 5 ml of Hexopal Suspension or 2 Hexopal Tablets three times a day), but this may be increased to 4 g daily if necessary. For patients with vasospastic conditions, including chilblains, primary and secondary Raynaud's phenomenon, night cramps, restless legs, acrocyanosis and erythrocyanosis, an initial dosage of 3 tablets daily is recommended, but dosage depends on response to treatment and may be increased to 3 or 4 g daily if necessary.

Contra-indications, warnings, etc There are no known contra-indications or precautions associated with the use of Hexopal, and side-effects are uncommon.

Hexopal appears to be virtually non-toxic to animals even in doses up to 100 times the normal therapeutic level. Despite extensive clinical experience in Britain since 1959, no case of poisoning or overdosage with Hexopal has been reported. In an emergency it is suggested that the stomach should be emptied by gastric lavage and symptomatic treatment given.

Pharmaceutical precautions When doses of less than 5 ml are ordered. Hexopal suspension may be diluted with Syrup BP so that the standard 5 ml spoonful may be given.

Legal category Hexopal Tablets GSL
Hexopal Suspension P.

Package quantities *Hexopal Tablets:* Bottles of 100 or 500

Hexopal Suspension: Bottles of 300 ml.

Further information In addition to a vasodilator effect thought to be due to the slow release of nicotinic acid, Hexopal appears to reduce blood viscosity. It also has a beneficial effect on the fibrinolytic system and on raised blood lipid levels.

HEXOPAL* FORTE

Presentation White or almost white, oval, bi-convex tablets marked HEX 750 on one side and scored on the other. Each tablet contains 750 mg Inositol Nicotinate BP.

Uses Hexopal Forte is for the symptomatic treatment of conditions arising from arterial insufficiency, such as intermittent claudication and in peripheral arteriosclerosis.

It is also recommended for the treatment of vasospastic conditions including chilblains, primary and secondary Raynaud's phenomenon, night cramps, 'restless legs', acrocyanosis and erythrocyanosis and other conditions where a peripheral vasodilator is required.

Dosage and administration *Adults:* In the symptomatic treatment of conditions such as secondary Raynaud's phenomenon, intermittent claudication and other forms of peripheral ischaemia due to arteriopathy, the usual starting dose is 3 g daily in divided doses. For arteriospastic conditions such as chilblains, acrocyanosis, erythrocyanosis, night cramps and 'restless legs', treatment may be started with a daily dose of 1.5 g, increasing to 3 g daily if necessary.

Contra-indications, warnings, etc There are no known contra-indications or precautions associated with the use of Hexopal, and side effects are uncommon. Hexopal appears to be virtually non-toxic to animals even in doses up to 100 times the normal therapeutic level. Despite extensive clinical experience in Britain since 1959, no cases of poisoning or overdosage with Hexopal have been reported. In an emergency, it is suggested that the stomach should be emptied by gastric lavage and symptomatic treatment given.

Pharmaceutical precautions Nil.

Legal category P.

Package quantities Hexopal Forte is supplied in bottles of 100 tablets.

Further information In addition to a vasodilator effect thought to be due to the slow release of nicotinic acid, Hexopal appears to reduce blood viscosity. It also has a beneficial effect on the fibrinolytic system and on raised blood lipid levels.

Product licence number 0071/0164.

KANNASYN*

Presentation Kannasyn Powder is a white, or almost white, crystalline powder. The powder is filled into vials containing Kanamycin Acid Sulphate BP equivalent to 1 g kanamycin base.

Kannasyn Solution is a sterile aqueous solution containing Kanamycin Sulphate equivalent to 250 mg/ml kanamycin base in clear glass vials. The vials

are of 4 ml nominal fill to provide doses of 1.0 g kanamycin base as the sulphate.

Uses Kannasyn is recommended for the treatment of infections due to Gram-negative organisms resistant to other antibiotics. It may also be used in the treatment of certain staphylococcal infections due to multiple-resistant strains, and in gonorrhoea.

Dosage and administration

1. **Intramuscular injection:** *Adults:* In acute infections: 1 g daily in two to four equally divided doses. Therapy should be limited to either a total dosage of 10 g or six days' treatment, whichever represents the greater quantity of antibiotic.

In chronic infections: 3 g weekly (1 g on alternate days) or 1 g twice a day, twice weekly (4 g weekly). The total amount administered should not exceed 50 g.

Children: In acute infections: 15 mg/kg body weight daily in 2-4 equally divided doses.

In chronic infections: there are no specific dosage recommendations.

2. **Intravenous use:** This route is recommended only for gravely ill patients with overwhelming infections or with impending vascular collapse. Kannasyn may be given as a solution containing 2.5 mg/ml by slow intravenous infusion at the rate of 3-4 ml per minute. The dosage for both adults and children is 15-30 mg/kg body weight daily in 2 or 3 divided doses.

3. **Intrathecal administration:** *Adults:* 100 mg in 10 ml saline once per day.

Children: Under 1 year: 25 mg in 10 ml saline once per day.

Over 1 year: 50 mg in 10 ml saline once per day.

It should be noted, however, that 7.5 mg/kg intramuscularly has produced CSF concentrations of 9 mcg/ml in infants with bacterial meningitis. This is about double the CSF concentration produced in normal infants and exceeds the MIC of many pathogens.

Contra-indications, warnings, etc Local intolerance to intramuscular injection has sometimes been reported, but it is transient and does not require interruption of therapy. Echinomoses have also been observed at the site of injection in a few patients. It has been suggested that high concentrations of kanamycin have anticoagulant properties, and this may explain these local haematomas at the injection site. It should, however, be noted that anticoagulant levels of kanamycin are not obtained in the blood with therapeutic doses. Sensitivity rashes appear to be uncommon. Intravenous injections are well tolerated and pain is not a problem. Thrombophlebitis has only been reported once in a patient who was receiving 50 million units of penicillin with the kanamycin.

As with other aminoglycoside antibiotics, apnoea and respiratory depression has been reported following the intraperitoneal use of kanamycin because of a curare-like effect. In addition, motor and sensory neuropathy has occurred following local application of kanamycin during spinal surgery, it has also produced slight weakening in muscle strength in a patient with myasthenia gravis. Because of these effects, it has been suggested that kanamycin should not be given intraperitoneally during surgery to patients who have received neuromuscular blocking agents.

Calcium gluconate has been suggested to counteract this curare-like action of kanamycin, but neostigmine appears to be more effective.

It has been shown that calcium can inhibit the antibacterial activity of kanamycin against certain organisms and for this reason the routine prophylactic use of calcium solutions with intraperitoneal kanamycin should be discouraged. In common with certain other antibiotics, kanamycin can affect the hearing when used in large doses or for long periods. This auditory damage, which may be permanent, is usually but not always preceded by tinnitus. Should this appear, the dose of kanamycin should be reduced or it should be discontinued. This antibiotic should always be administered with caution and preferably only in severe or resistant infections caused by organisms known to be sensitive to the compound, and blood levels should not be allowed to rise above 30 mcg/ml.

Hyaline and granular casts are sometimes observed in urine samples collected in the first 16 hours after administration in patients who have been given high doses of kanamycin. In these cases no permanent impairment of renal function occurs and the casts disappear within a few days of stopping treatment. Although nephrotoxic effects have been reported in some studies serious renal toxicity is not a frequent problem with the doses now used. It should be noted that prior treatment with streptomycin or viomycin may increase the likelihood of a nephrotoxic reaction with kanamycin.

In cases of impaired renal function, the kidney may be unable to eliminate kanamycin effectively and as a result the serum level will rise quickly. In these conditions reduced doses are necessary to avoid toxic effects. It has been reported that kanamycin is retained in the serum of patients with renal disease for a considerable time. If it is necessary to give the antibiotic to anuric patients, they should not receive increments more frequently than every three to four days and these increments should be one-half the loading dose used. The safest procedure, however, is to control the dosage by blood-level studies to prevent a rise above 30 mcg per ml.

The use of potent diuretics such as ethacrynic acid or frusemide with kanamycin should be avoided because they are known to potentiate the toxic action of aminoglycoside antibiotics.

Kanamycin is poorly absorbed from the gastro-intestinal tract and oral administration does not normally give rise to systemic side-effects.

Pharmaceutical precautions Kannasyn should be protected from light. The powder may be stored at room temperature but should be used within three years of assay. When dissolved in water, the solution will keep for two to three weeks at room temperature and for three weeks to one month if refrigerated. Solutions left at room temperature may discolour slightly, but there is no loss of activity for 24 days. This colour change may be prevented or retarded by adjusting the pH to 5.5. A bacteriostat such as a 0.5% phenol or 0.1% chlorocresol may be added.

Kannasyn Solution (4 ml vials) may also be stored at room temperature but should be used within two years of assay. There is no loss of potency when it is subjected to a temperature of 100°C for one hour. Dilutions of Kannasyn Solution may be made with normal saline or 5% dextrose and these remain stable for two to three months at room temperature. It should be noted, however, that such dilution may reduce the amount of bacteriostats to ineffective levels, and the reduction in concentration of sodium metabisulphite could lead to the solution developing a yellowish tint.

Infusion solutions containing kanamycin have been reported to be incompatible with the following substances: amphotericin, barbiturates, cephalothin sodium, chlorpromazine, electrolytes (Ca^{++} Mg^{++} , citrate or phosphate ions), heparin, hydrocortisone, methicillin sodium, methohexitone, nitrofurantoin, phenytoin, prochlorperazine, sulphafurazole.

Legal category POM.

Package quantities *Kannasyn Powder*: Boxes of 5 vials.

Kannasyn Solution: Boxes of 5 vials each containing 4 ml.

Kannasyn Solution 0071/5053

LENIUM®

Presentation Lenium is an orange-yellow cream which, on mixing with water, gives a copious soft foam and leaves a fine red to orange colour precipitate. It has a characteristic lavender odour, and contains 2.5% w/w Selenium Sulphide BP.

Uses Lenium is recommended for the control of pityriasis capitis and seborrhoeic dermatitis of the scalp and dandruff.

Dosage and administration Lenium is for topical use only for adults or children. The amount of Lenium required varies from person to person; sufficient should be used to allow the lather to penetrate to the scalp.

Lenium should be applied twice a week for two weeks, once a week for a further two weeks, then as required to maintain control of dandruff (every three to six weeks). After initial treatment it is neither necessary nor desirable to use Lenium weekly to maintain control.

Selenium sulphide has a low index of sensitivity and a low toxicity when applied to the intact skin. When used in accordance with the instructions it should not discolour grey or light hair and it can be used on hair which has been waved or tinted.

Contra-indications, warnings, etc The successful control of dandruff with Lenium may cause an increase in the secretion of the natural oil of the scalp. If this becomes excessive an ordinary shampoo should be used between Lenium treatments.

Precautions: Wash the hands thoroughly after use. Keep out of reach of children. Do not apply to broken or denuded skin. Selenium sulphide may discolour some metals. Do not apply at the time hot or cold permanent waves are being given. Do not allow to enter the eyes. More than 48 hours should elapse between the use of Lenium and the application of hair-tinting agents.

Accidental ingestion: Although insoluble selenium sulphide is less toxic than soluble selenium compounds it may produce signs of acute toxicity if swallowed. Apart from symptomatic measures treatment consists of gastric lavage and saline cathartics. Ascorbic acid orally may increase the rate of excretion in the urine. BAL should not be used as an antidote since it may aggravate symptoms.

Pharmaceutical precautions Nil.

Legal category P.

Package quantities Lenium is available in 9 g sachets and flexible plastic tubes containing 42 g or 100 g.

Further information Nil.

Product licence number 0071/5055.

LEVOPHED® LEVOPHED® SPECIAL

Presentation Levophed is a clear, colourless or almost colourless solution containing 2 mg/ml Noradrenaline Acid Tartrate BP (equivalent to 1 mg/ml noradrenaline base).

Levophed Special is a clear, colourless or almost colourless, sterile solution containing 0.2 mg/ml Noradrenaline Acid Tartrate BP (equivalent to 0.1 mg/ml of noradrenaline base).

Uses Levophed is recommended for use as an emergency measure to restore the blood pressure to normal in cases of acute hypotension.

Dosage and administration Levophed Solution should be diluted and administered as an intravenous infusion, preferably through a fine polythene catheter inserted into an arm or leg vein where blood flow is rapid. It is recommended that Levophed be administered in 5% dextrose or dextrose-saline solution.

Adults: A suitable initial concentration is obtained by adding 4 ml Levophed to a litre of infusion fluid to give a drug concentration of 4 mcg per ml. There is a direct relationship between the drip rate and the blood pressure. After observing the response to an initial dose of 2 ml or 3 ml per minute, the rate of flow should be adjusted to establish and maintain a low normal blood pressure (100–120 mm Hg systolic), or somewhat higher in previously hypertensive patients. In patients with severe haemorrhagic or hypovolaemic shock, when blood or fluid replacement has not been completed, it is preferable to maintain the pressure at a lower level sufficient to maintain the circulation to vital organs. The average maintenance dose ranges from 0.5 ml to 1 ml per minute, but there is great individual variation in the dose required to attain and maintain normotension. Infusion should be continued until adequate blood pressure is maintained without the help of Levophed. The concentration of the solution employed depends on the clinical needs. If larger volumes of fluid are required at a flow rate which would involve an excessive dose of pressor agent, the solution may be used more diluted than the 4 mcg/ml suggested. Conversely, where fluid volume should be restricted as in congestive heart failure, higher concentrations may be used.

Levophed Special: In cases of cardiac standstill the rapid intravenous or intracardiac injection of 0.50–0.75 ml of undiluted Levophed Special may restore a recordable blood pressure for one to four minutes. After intravenous injection the solution should be massaged towards the heart.

A similar dose may be repeated when the blood pressure starts to fall again or blood pressure can be maintained with normal Levophed drip. If there is no response to Levophed Special Solution administration intravenously, cardiac massage should be started with the injection of 0.50–0.75 ml Levophed Special into the ascending aorta or into the left auricle. Injection into the ventricle should be avoided because of the possible risk of inducing fibrillation. If the myocardium is fibrillating, a dose of Levophed Special may be injected after normal

rhythm has been restored by massage or by electrical defibrillation.

Contra-indications, warnings, etc Check blood pressure frequently during administration to avoid hypotension. Extravasation of the solution may cause local tissue necrosis. It has been suggested that phentolamine may be added directly to the infusion flask to act as an antidote against sloughing without affecting the vaso-pressor activity of the Levophed.

The use of pressor amines during halothane anaesthesia may cause serious cardiac arrhythmias. Because of the possibility of increasing the risk of ventricular fibrillation, Levophed should be used with caution in patients receiving cyclopropane or any other cardiac sensitising agent.

Pharmaceutical precautions Protect from light. The solution should not be used if it is brown in colour. Levophed is best administered in 5% dextrose or dextrose saline solution because the dextrose protects against significant loss of potency due to oxidation. Deterioration occurs more rapidly in normal saline, but plasma, blood and blood substitutes can be used as diluents, though Levophed is less stable in these than in dextrose solution. If Levophed is administered in blood, ascorbic acid (10^{-6}) should be added to reduce the rate of oxidation.

Infusion solutions containing noradrenaline acid tartrate have been reported to be incompatible with the following substances: alkalis and oxidising agents, barbiturates, chlorpheniramine, chlorothiazide, nitrofurantoin, novobiocin, phenytoin, sodium bicarbonate, sodium iodide, streptomycin.

Legal category POM.

Package quantities *Levophed:* Boxes of six 2 ml or 4 ml ampoules.

Levophed Special: Boxes of five 2 ml ampoules.

Further information Nil.

LINGRAINE®

Presentation Lingraine Tablets are bright green, bi-convex tablets, 6.4 mm in diameter, with no markings. Each tablet contains 2.0 mg Ergotamine Tartrate BP.

Uses Lingraine Tablets are recommended for the relief of migraine and other vascular headaches.

Dosage and administration Lingraine Tablets are for sublingual administration only.

Adults: 1 tablet to be taken at the first sign of an attack of migraine. If necessary another tablet may be taken half an hour to an hour later. No more than 3 tablets should be taken in 24 hours and not more than 8 tablets in any one week.

Contra-indications, warnings, etc Because ergotamine brings about constriction of peripheral blood vessels it should not be used in the presence of severe arteriosclerosis, coronary artery disease, thrombophlebitis, Raynaud's syndrome or Buerger's disease. Lingraine should not be used where there is liver or kidney dysfunction, and since (like other ergot alkaloids) it causes contraction of uterine muscle it should not be used during pregnancy.

dosage: Like all the natural amino-acid alkaloids of opium, ergotamine is a highly toxic substance which may cause chronic or acute poisoning, although the latter is infrequent. The oral administration of 26 mg over several days has proved fatal, and there have also been deaths from as little as 0.5 mg to 1.5 mg in a single action.

The principal signs of overdosage are convulsions and severe peripheral vasoconstriction, leading to gangrene of the extremities.

The main symptoms consist of vomiting, diarrhoea, quenchable thirst, tingling, itching and coldness of the skin, a rapid and weak pulse, confusion and consciousness. Amyl nitrate inhalations (0.2–0.3 ml) are suggested to maintain vasodilation. Gangrene of the extremities calls for surgical measures.

side-effects: These are a relatively minor problem if the use is carefully regulated. Nausea and vomiting are most frequently reported; other side-effects encountered include abdominal pain, leg cramps, vertigo, diarrhoea and, occasionally, increased headache.

Pharmaceutical precautions Nil.

Legal category POM.

Package quantities Lingrain Tablets are available in 20 P. laminate strips in boxes of 12 tablets.

Further information Nil.

Product licence number 0071/5058.

LOBAK*

Presentation Lobak Tablets are white, flat tablets with bevelled edges, 12.7 mm in diameter, marked Lobak on one side and scored on the other. Each tablet contains 100 mg Paracetamol BP and 100 mg chlormezanone.

Uses For the treatment of painful conditions where the combination of an analgesic and a mild tranquilliser/muscle relaxant would be of value. Such conditions include the short-term symptomatic treatment of acute musculoskeletal disorders associated with painful muscle spasm.

Dosage and administration For oral administration only.

Adults: The usual dose is 1 or 2 tablets three times daily. The dosage should be adjusted to the patient's response, but should not exceed 8 tablets daily.

Elderly: Half the normal adult dose or less may be sufficient for a therapeutic response in the elderly. Not recommended for children.

Contra-indications, warnings, etc *Precautions and drug interactions:* Chlormezanone at high doses may modify the patient's reactions (performance at skilled tasks, alertness, etc.) to a varying extent, depending upon individual susceptibility. Therefore patients should be advised not to drive or operate machinery during treatment, if affected. If Lobak is administered with CNS depressants, it is possible that their sedative effect may be intensified. As with other drugs acting on the central nervous system, patients should avoid alcohol while receiving Lobak since the response cannot be predicted.

Lobak should be given with caution to patients with hepatic or renal insufficiency.

There is insufficient evidence of safety of chlormezanone in human pregnancy nor is there evidence from

animal work that it is free from hazard. Do not use Lobak during pregnancy especially the first trimester, unless there are compelling reasons.

Overdosage: should be treated by gastric lavage (if the product has been recently ingested). The signs and symptoms following chlormezanone overdosage will probably resemble those seen with other central depressant drugs, for example, somnolence, prostration, muscular incoordination and memory disturbance. In severe cases hypotension, respiratory depression and loss of consciousness may occur. Symptomatic treatment is suggested for chlormezanone overdosage.

Patients who have taken an overdose of paracetamol may appear well for the first three days then succumb with liver damage. The hepatic changes produced by overdose of paracetamol result from the accumulation of a highly reactive intermediate metabolite in the hepatocytes. N-acetylcysteine intravenously or 1-methionine orally protect the liver if administered within 10 hours of ingesting an overdose.

Side-effects: Drowsiness and dizziness have been the commonest side effects, particularly at higher doses. Other reported side effects include nausea, lightheadedness, headache, lethargy, skin rashes and dryness of the mouth. Cholestatic jaundice has occurred.

The dependence potential of chlormezanone is not known.

Pharmaceutical precautions Nil.

Legal category POM.

Package quantities Lobak is supplied in bottles of 50 or 500.

Further information Chlormezanone acts by blocking polysynaptic reflex pathways both in the subcortical centres and in the spinal cord. It has no direct action on skeletal muscle, nor does it affect myoneurial junctions or peripheral nerves. At non-toxic levels, it has no action on the autonomic nervous system, nor any direct action on smooth muscle.

Product licence number 0071/5059.

LUMINAL*

Presentation Luminal Tablets are white, bi-convex tablets, 6.0 mm in diameter, marked III on one side and either LUM 15, LUM 30 or LUM 60 on the other. Each tablet contains 15 mg, 30 mg or 60 mg Phenobarbitone BP respectively.

Uses Luminal Tablets are recommended primarily for use as a general sedative, particularly in epilepsy and all other conditions requiring long-term sedation. They may also be used as a hypnotic.

Dosage and administration For oral administration only.

Adults: As a general sedative the dosage ranges from 15 mg to 30 mg two or three times daily and 100–300 mg may be employed as a hypnotic. The dose should not exceed 600 mg in 24 hours, and the effect of such large doses should be carefully watched.

Children: 1–12 years: 30–60 mg daily.

Up to 1 year: 15–30 mg daily.

Contra-indications, warnings, etc

Contra-indications: Acute intermittent porphyria and

patients who are hypersensitive or who exhibit idiosyncrasy to barbiturates.

Precautions: Phenobarbitone in daily doses is cumulative and its effects will eventually extend into the day if used on many successive nights. It is therefore more suitable for continuous sedation than for regular hypnosis. Continuous use of excessive amounts may result in ataxia, stupor and delirium, and the possibility of tolerance and drug dependence of the barbiturate-alcohol type should always be borne in mind. In these circumstances, abrupt cessation of treatment may give rise to withdrawal symptoms.

Some patients exhibit idiosyncrasy to barbiturates, and such individuals' response to these compounds is likely to be restlessness and excitement even in the absence of pain.

Barbiturates should be used with caution in debilitated or senile patients. Large doses should not be given to patients with renal impairment or with diseases of the liver. In severe pulmonary insufficiency even hypnotic doses of barbiturates will depress the respiration. Barbiturates may potentiate the central depressant effect of alcohol and affect the action of a number of other drugs, by hepatic enzyme induction including coumarin type anticoagulants, systemic steroids (including oral contraceptives), phenytoin, griseofulvin, rifampicin, phenothiazines and tricyclic antidepressants.

Overdosage: Where patients are seen within four hours of taking an overdose, gastric aspiration or lavage may be beneficial in adults, while children who are conscious may be given an emetic, e.g. Syrup of Ipecacuanha.

The prime objective in treating phenobarbitone overdose is to maintain vital functions (respiration, cardiovascular and renal function, and electrolyte balance) while the majority of the drug is metabolised by hepatic enzymes. At the same time some of the drug is excreted unchanged by the kidneys. Given normal renal function, this latter process may be enhanced by alkaline diuresis, maintaining the urinary pH at about 8 by appropriate intravenous infusion. In severe cases, haemodialysis may help, but extracorporeal haemoperfusion is probably more effective.

Side-effects: These are usually manifestations of the drug's depressant effect on the CNS but rashes can also occur.

Pharmaceutical precautions Nil.

Legal category POM.

Package quantities *Luminal Tablets 15 mg:* Bottles of 100.

Luminal Tablets 30 mg: Bottles of 100 or 500.

Luminal Tablets 60 mg: Bottles of 250.

Further information Nil.

Product licence numbers

Luminal 15 mg 0071/5060

Luminal 30 mg 0071/5061

Luminal 60 mg 0071/5062

MICTRAL*

Presentation A mixture of granules containing particles varying in colour from white to yellow. When added to water, they disperse with slight effervescence, yielding a butterscotch-flavour suspension. Each 7 g of granules contains Nalidixic Acid BP 660 mg, Sodium Citrate BP

3.75 g, Anhydrous Citric Acid BP 250 mg and Sod Bicarbonate BP 250 mg.

Uses For the treatment of cystitis and lower urinary tract infections caused by pathogens sensitive to nalidixic acid.

Dosage and administration For oral administration only.

Adults: The contents of one sachet should be dissolved in a tumblerful of water and taken three times a day. A day course is normally sufficient. Not recommended for children.

Contra-indications, warnings, etc Nalidixic acid should not be given to patients with a history of convulsive disorders. It should be used with caution in patients with liver disease. Patients should avoid excessive exposure to sunlight. Although there is no evidence that nalidixic acid has any harmful effect during pregnancy, careful consideration should, as with all drugs, be given to the use of Mictal granules during the first trimester. Small amounts of nalidixic acid may be excreted in human milk. When nalidixic acid is given to patients on anticoagulant therapy, it may be necessary to reduce the anticoagulant dosage. Mictal may precipitate a haemolytic reaction in G-6-PD-deficient individuals. Each sachet contains the equivalent of 950 mg sodium.

Active proliferation of the organisms is a necessary condition for the antibacterial action of nalidixic acid. The action of Mictal may therefore be inhibited by the presence of other antibacterial substances.

When testing for glycosuria in patients receiving Mictal, 'Clinistix' or 'Tes-Tape' should be used since other reagents may give a false-positive result.

Nalidixic acid, in therapeutic doses, can interfere with the estimation of urinary 17-ketosteroids and may cause high results in the assay of urinary vanilmandelic acid (Pisano method).

Overdosage: Because of the nature of the product, serious overdosage is unlikely. An excessive amount of granules is likely to cause vomiting.

Side Effects: Gastro-intestinal effects (constipation, diarrhoea, anorexia, nausea or vomiting) and subjective visual disturbances have been reported with nalidixic acid. They have resolved on reducing the dose or discontinuing treatment. If skin rashes occur, administration of Mictal should be stopped.

Pharmaceutical precautions Nil.

Legal category POM.

Package quantities Cartons containing nine sachets.

Further information Sodium citrate raises the urinary pH. In these conditions, it has been shown that the amount of free nalidixic acid and of its active metabolite which appears in the urine is more than doubled as a result of a corresponding reduction in inactive glucuronides.

Product licence number 0071/0126.

MYCARDOL*

Presentation Mycardol Tablets are white, flat tablets with bevelled edges, 7.9 mm in diameter, marked M

e side and scored on the other. Each tablet contains mg pentaerythritol tetranitrate.

Uses Mycardol Tablets are recommended for the symptomatic treatment of angina pectoris. They are not recommended as a single measure for the treatment of ginal attacks, but rather as an adjunct to glyceryl trinitrate.

Dosage and administration For oral administration ly.

Adults: The usual dosage is 2 tablets three times a day, though some may need 2 tablets four times daily. If there nocturnal pain, the last dose should be taken before going to bed. The tablets should be taken before meals.

Children: There are no dosage recommendations for children.

Contra-indications, warnings, etc Mycardol should not be used immediately following a coronary thrombosis. It should be used with caution in cases of angina pectoris.

Overdosage: There have been no reports of Mycardol overdosage.

The possible effects of pentaerythritol tetranitrate toxicity are reported as being: cyanosis, methaemoglobinemia, severe headache, fall in blood pressure, muscular weakness, dizziness, palpitation, vomiting and diarrhoea. Chronic overdosage may result in confusion and collapse, particularly in sensitive patients.

In the event of severe headache due to overdosage, caffeine, neostigmine or amphetamine are indicated.

Methylene blue is usually recommended for the correction of methaemoglobinemia: it is also indicated in the event of cyanosis (up to 50 ml of 1% solution i.v.). Treatment of other serious toxic effects will consist of gastric lavage and saline cathartics (e.g. sodium sulphate, 30 g in 250 ml). Blood pressure should be restored by external means (prone position with feet raised) or by epinephrine, 15 mg i.m.

Side-effects: No serious side-effects have been encountered following normal dosage, even over long periods. Headache, lethargy and nausea can occur during the first few days of treatment. If palpitations or vomiting occur, treatment should be stopped.

Methaemoglobinemia is rarely seen with therapeutic dosage. Tolerance to Mycardol does not appear to develop.

Pharmaceutical precautions Store in a cool place and protect from light.

Legal category P.

Package quantities Mycardol Tablets are supplied in bottles of 100.

Further information Nil.

Product licence number 0071/5065.

NEOPHYRYN*

Presentation Neophryn Nasal Drops consist of a clear, colourless solution containing 0.25% w/v Phenylephrine Hydrochloride BP.

Neophryn Nasal Spray is a clear, colourless solution containing 0.5% w/v Phenylephrine Hydrochloride BP in a plastic spray bottle presentation. The solution has a faint aromatic odour and foams when shaken.

Uses Neophryn Nasal Drops and Neophryn Nasal

Spray are recommended for the relief of nasal congestion in such conditions as the common cold, sinusitis and vasomotor rhinitis.

Dosage and administration

1. **Neophryn Nasal Drops:** *Adults:* 2–3 drops in each nostril. In sinusitis, Neophryn Drops are well adapted to the Proetz displacement technique, but the alternative lateral head low method may equally well be used.

Children: 1–2 drops in each nostril.

2. **Neophryn Nasal Spray:** *Adults:* The tip of the atomiser should be inserted into each nostril in turn and the container squeezed twice, sharply, as the patient breathes in. The application may be repeated in three to four hours if necessary.

Contra-indications, warnings, etc Because Neophryn contains a sympathomimetic amine it should not be used by patients taking monoamine oxidase inhibitors and it should be used with caution by patients taking β -adrenergic blocking agents. Neophryn appears to be remarkably free from side-effects, but like all solutions for nasal application, it should be used for short periods only, because prolonged use may permanently damage the respiratory mucosa, and may even induce hypersensitivity. It is therefore suggested that Neophryn should not be used for longer than three weeks and that it should not be used for chronic nasal obstruction.

Toxicity resulting from local use is practically unknown because the local vasoconstrictor action of phenylephrine retards its absorption. In the alimentary tract, phenylephrine is hydrolysed and absorption is unpredictable. This, combined with the small amount in each pack, makes acute overdosage highly unlikely.

Pharmaceutical precautions Nil.

Legal category P.

Package quantities *Neophryn Nasal Drops:* Bottles of 15 ml complete with dropper.

Neophryn Nasal Spray: Plastic spray bottles each containing 15 ml.

Further information Nil.

Neophryn Nasal Drops 0071/5069

Neophryn Nasal Spray 0071/5070

PANADEINE* CO.

Presentation Panadeine Co. Tablets are flat, white tablets with bevelled edges, 12.7 mm in diameter, marked Panadeine Co. on one side and scored on the other. Each tablet contains 500 mg Paracetamol BP and 8 mg Codeine Phosphate BP.

Uses Panadeine Co. Tablets are recommended for the treatment of most painful and febrile conditions such as headache, toothache, colds, influenza, dysmenorrhoea, arthritis and rheumatic pain.

Dosage and administration For oral administration only.

Adults: 2 tablets taken with a draught of water up to four times daily as required.

Children: 7–12 years: $\frac{1}{2}$ –1 tablet. This dose should not be repeated more frequently than every 4 hours and not more than 4 doses should be given in any 24-hour period.

Under 7 years: Panadeine Co. is not recommended.

Contra-indications, warnings, etc There is epidemiological evidence of the safety of paracetamol in human pregnancy. Codeine has been used for many years without apparent ill consequences and animal studies have not shown any hazard.

Overdosage: Nausea and vomiting are prominent symptoms of codeine toxicity and there is evidence of circulatory and respiratory depression. Suggested treatment is gastric lavage and catharsis, e.g. sodium sulphate 30 g. If CNS depression is severe, artificial respiration and oxygen may be necessary. Naloxone can be used to combat the depression.

Patients who have taken an overdose of paracetamol may appear well for the first three days, then succumb to liver damage. The hepatic changes produced by overdosage of paracetamol appear to result from the accumulation of a highly active intermediate metabolite in the hepatocytes. N-acetyl-cysteine intravenously, or l-methionine orally protects the liver if administered within 10 hours of ingesting an overdose.

Pharmaceutical precautions Panadeine Co. should be stored in well-closed containers protected from light and moisture.

Legal category P.

Package quantities Blister packs of 12, 24 and 48 tablets and bottles containing 100 or 1,000 tablets.

Further information Nil.

Product licence number 0071/5073.

PANADOL*

Presentation Panadol Tablets are flat, white tablets with bevelled edges, 12.7 mm in diameter, marked Panadol on both sides. Each tablet contains 500 mg Paracetamol BP.

Panadol Caplets. Capsule-shaped tablets, 17 mm long and 8 mm wide, marked Panadol on one face, each containing 500 mg Paracetamol B.P.

Panadol Soluble consists of white, bevelled-edged, unmarked, scored tablets which effervesce vigorously when placed in water. Each is 25.4 mm in diameter and contains 500 mg Paracetamol BP.

Panadol Elixir is a clear, yellow, viscous solution with a characteristic odour of passion fruit and containing 120 mg Paracetamol BP per 5 ml dose.

Uses Panadol is a mild analgesic and antipyretic. The tablets are recommended for the treatment of most painful and febrile conditions, for example, headache, toothache, colds, influenza, rheumatic pain and dysmenorrhoea.

Panadol Elixir is recommended for the treatment of painful and febrile conditions of childhood such as teething, headache, toothache, earache, general aches and pains, colds, influenza and reactions after immunisation and vaccination.

Dosage and administration For oral administration only. Panadol Soluble should be dissolved in a tumbler of water before taking. Panadol tablets, caplets and Panadol Soluble:

Adults: Two tablets up to 4 times a day, as required.

Children: 6–12 years: Half to one tablet. For younger children, use Panadol Elixir as follows:

3 months–1 year: Half to one 5 ml spoonful (preferably in milk).

1 year–6 years: One or two 5 ml spoonfuls.

6 years–12 years: Two to four 5 ml spoonfuls. Children should not be given doses of Panadol more frequently than every 4 hours and not more than 4 doses should be given in any 24-hour period.

Contra-indications, warnings, etc There is epidemiological evidence of the safety of paracetamol in human pregnancy. It should be noted that each Panadol Soluble tablet contains 421 mg ionic sodium and the fore caution is necessary in long-term use of them in patients with hypertension, cardiac or renal insufficiency, oedema of pregnancy or wherever salt-restricted intake is indicated.

Overdosage: It should be noted that patients who have taken an overdose of paracetamol may appear well for the first three days then succumb with liver damage. The hepatic changes produced by overdosage of paracetamol appear to result from the accumulation of a highly reactive intermediate metabolite in the hepatocytes. N-acetyl-cysteine intravenously, or l-methionine orally protects the liver if administered within 10 hours of ingesting the overdose.

Pharmaceutical precautions Where doses of less than 5 ml are ordered Panadol Elixir may be diluted with Syrup BP so that the standard 5 ml spoonful can be given. Such dilutions will remain stable for two to three weeks. Protect tablets from light and moisture.

Legal category 12s, 24s GSL, 48, 60s, 96s and 2,500 P. Panadol Elixir P.

Package quantities *Panadol Tablets:* Blister packs of 12, 24, 48 and 96 tablets and dispensing packs of 500 and 2,500.

Panadol Caplets are supplied in opaque blisters in cartons of 48.

Panadol Soluble tablets are packed in PFP laminated strips in cartons of 12, 24 and 60 tablets.

Panadol Elixir: Bottles containing 60 ml, 112 ml or 1 litre.

Further information Nil.

PANASORB*

Presentation Panasorb Tablets are flat, white tablets with bevelled edges, 12.7 mm in diameter, marked Panasorb on both faces. Each tablet contains 500 mg Paracetamol BP.

Uses Panasorb Tablets are recommended for the treatment of most painful and febrile conditions, for example, headache, toothache, colds, influenza, rheumatic pain and dysmenorrhoea.

Dosage and administration For oral administration only.

Adults: 2 tablets up to four times daily.

Children: Not suitable for children under 6 years old.

6–12 years: Half to one tablet.

These doses should not be repeated more frequently than every 4 hours, nor should more than 4 doses be given in any 24-hour period.

For younger children, it is recommended that Panadol (ir) be used.

Contra-indications, warnings, etc

There is epidemiological evidence of the safety of acetamol in pregnancy.

Dosage: It should be noted that patients who have had an overdose of paracetamol may appear well for the first three days, then succumb with liver damage. The metabolic changes produced by overdosage of paracetamol appear to result from the accumulation of a highly reactive intermediate metabolite in the hepatocytes. N-Acetyl-cysteine intravenously, or L-methionine orally protects the liver if administered within 10 hours of ingesting an overdose.

Pharmaceutical precautions Panasorb should be stored in well-closed containers protected from light and moisture.

Legal category 12s and 24s GSL, 250s and 1,000s P.

Package quantities Panasorb is available in blister packs of 12 or 24 tablets and in bottles of 250 and tins 1,000 tablets.

Further information Panasorb Tablets are formulated with a special sorbitol-containing base. Average blood levels of paracetamol with Panasorb are higher than those with crushed paracetamol tablets. Because of better absorption in poor paracetamol absorbers relief of symptoms may be more effective.

Product licence number 0071/5076.

PANODORM*

Presentation Panodorm Tablets are white, bi-convex tablets, 10.3 mm in diameter, marked with a triangle on one side and plain on the other side. Each tablet contains 10 mg Cyclobarbitone Calcium BP.

Uses Panodorm Tablets are recommended for the treatment of severe, intractable insomnia.

Dosage and administration For oral administration orally.

Dosage: $\frac{1}{2}$ –2 tablets before retiring.

Contra-indications, warnings, etc

Contra-indications: Barbiturate hypnotics should not be used in children, young adults, the elderly or in patients who are debilitated, or in those who have a history of alcohol or drug abuse. They are also contra-indicated in the presence of uncontrolled pain, pregnancy or breast feeding and porphyria.

Precautions: In patients with renal or hepatic failure, the dose should be reduced. Because barbiturates can decrease the activity of hepatic enzymes involved in drug metabolism, the availability and blood concentration of concurrently administered drugs may be altered. Among the compounds known to be affected are coumarin-type anticoagulants, systemic steroids (including oral contraceptives), phenytoin, griseofulvin, rifampicin, phenothiazines and tricyclic antidepressants.

Overdosage: Where patients are seen within four hours of taking an overdose, gastric aspiration or lavage may be beneficial in adults, while children who are conscious may be given an emetic, e.g. Syrup of Ipecacuanha. The prime objective in treating barbiturate overdosage is to maintain vital functions (respiration, cardiovascular

and renal function and electrolyte balance) while the majority of the drug is metabolised by hepatic enzymes. At the same time some of the drug is excreted unchanged by the kidneys. Given normal renal function, this latter process may be enhanced by alkaline diuresis, maintaining the urinary pH at about 8 by appropriate intravenous infusion. In severe cases, haemodialysis may help, but extracorporeal haemoperfusion is probably more effective.

Side Effects: Drowsiness, sedation, unsteadiness, vertigo and inco-ordination may occur. During the first week of administration, performance and alertness may be impaired; patients should be warned not to drive or operate machinery if affected. These effects may be potentiated by alcohol.

Pharmaceutical precautions Nil.

Legal category POM.

Package quantities Panodorm is available in bottles of 50 tablets.

Further information Barbiturates have a high addiction potential. Long-term use or use of high doses for short periods may lead to tolerance and subsequently to physical and psychological dependence. Symptoms of dependence include confusion, defective judgement and loss of emotional control. Withdrawal symptoms occur after long-term normal use (and particularly after abuse) if barbiturate treatment is stopped abruptly. These include nightmares, irritability and insomnia and, in severe cases, tremors, delirium, convulsions and death. Withdrawal symptoms have been reported in neonates after barbiturate treatment during pregnancy and labour.

Product licence number 0071/5077.

pHiso-MED*

Presentation A white solution which forms suds when added to water. It contains 21.1% w/w Chlorhexidine Gluconate Solution BP (equivalent to 4% w/w chlorhexidine gluconate) and 2% Benzyl Alcohol BP as preservative.

Uses 1. Pre-operative preparation of surgeons' and nurses' hands and the skin of patients.

2. As an antiseptic skin cleanser for routine hand washing and for spots and acne on the face, shoulders and chest.

3. For use in maternity units by nurses and mothers, and for bathing babies, as a measure to prevent cross-infection.

Dosage and administration 1. *Pre-operative hand preparation:* Wet the hands and forearms, apply about 5 ml of solution and wash for one minute. Thoroughly clean finger-nails with a brush or scraper. Rinse, and repeat the wash for two minutes. Rinse thoroughly and dry. 2. *Preparation of patients for elective surgery:* Using a sterile swab, the solution is rubbed over the site and surrounding skin for two minutes, adding a little sterile water to work up a lather. Wipe off and dry thoroughly with fresh sterile swabs. Subsequently, at the time of operation, a 0.5% solution of chlorhexidine in alcohol should be applied to the site with sterile gauze swabs. The site and the surrounding skin should be rubbed vigorously for two minutes and until dry. 3. *As an antiseptic skin cleanser:* Wet the area to be cleaned, apply 5 ml of solution and wash for one minute. Rinse

thoroughly and dry. 4. *For bathing infants in maternity unit:* A 1 in 10 dilution of the solution is applied over the baby's body with a swab or with the palm of the hand. Rinse thoroughly with warm water and dry in the usual way.

Contra-indications, warnings, etc Chlorhexidine should not be allowed to come into contact with the brain, meninges or middle ear. During use, ensure that the solution is kept away from the eyes and ears. Material which has been in contact with the solution may be stained brown by hypochlorite bleaches.

Overdosage: If the solution is swallowed, it should be removed from the stomach by gastric lavage and symptomatic treatment applied as necessary.

Pharmaceutical precautions Protect from heat and light.

Legal category GSL.

Package quantities Containers of 150 ml.

Further information Nil.

Product licence number 0071/0178.

PLAQUENIL*

Presentation Plaquenil Tablets are smoothly polished, orange-coloured, sugar-coated tablets with no markings. Each tablet contains 200 mg Hydroxychloroquine Sulphate BP.

Uses Plaquenil Tablets are recommended for the treatment of rheumatoid arthritis, juvenile rheumatoid arthritis, discoid and systemic lupus erythematosus light-sensitive diseases, and the therapy and prophylaxis of malaria. The de-sludging action of Plaquenil may also be used for the prevention of post-operative deep vein thrombosis.

Dosage and administration

1. *For indications other than malaria and 'desludging'.*

Adults: up to 600 mg daily in divided doses. The minimum effective dose has yet to be determined but as little as 200 mg daily is often effective in systemic lupus erythematosus and rheumatoid arthritis. A reduction to this dose when a positive response has been obtained with a higher dose after 3-6 months may be attempted.

Children: 5-7 mg/kg body weight daily. Treatment should be discontinued if no improvement has occurred after 6 months.

2. **Malaria:** **Adults:** To treat an acute attack it is usual to give 800 mg (4 tablets) initially, followed by 400 mg (2 tablets) in six to eight hours, and then 400 mg on each of two successive days. A single dose of 800 mg has been used to eradicate *Plasmodium falciparum* infection and to terminate an acute attack of *Plasmodium vivax*.

3. **Malaria Prophylaxis:** **Adults:** a dose of 400 mg weekly.

Children: 6.4 mg/kg body weight once a week.

Prophylaxis should begin one week before arrival in a malarious area and continue for four to eight weeks after leaving the area.

4. **De-sludging:** **Adults:** Up to 800 mg daily in divided doses

Contra-indications, warnings, etc Because of the risk of irreversible retinal changes, all patients should

have an initial ophthalmological examination before treatment starts and every 3 months during treatment the event of scotomata, nyctalopia or other retinal changes occurring, Plaquenil should be discontinued immediately. When treating adults for long periods it is unwise to exceed a total dosage of 400 mg/day/year.

Because Plaquenil is known to concentrate in the liver it should be used with caution in patients with liver disease or those taking other drugs known to affect the liver. It should be used with caution or not at all in patients with severe gastro-intestinal, neurological blood disorders or with psoriasis.

Use of Plaquenil in pregnancy should be avoided except in the prophylaxis of malaria when the need must outweigh the possible risk.

The 4-aminoquinolines appear to exacerbate pre-existing porphyria. Plaquenil should be given with caution to patients with a history of quinine sensitivity. Drugs known to cause sensitisation or dermatitis, such as phenylbutazone or gold are probably best avoided during Plaquenil treatment. Plaquenil should be administered with caution in patients with glucose-6-phosphate dehydrogenase deficiency.

Though the risk of bone-marrow depression is low, periodic blood counts are advisable and Plaquenil should be discontinued if abnormalities develop. Corneal opacities sometimes appear which may be symptomless, which may cause disturbances such as haloes, blurring of vision or photophobia. They are reversible if treatment is stopped. Defects in visual accommodation may occur on first taking Plaquenil and patients should be warned regarding driving or operating machinery.

Skin reactions, bleaching of the hair and alopecia may also occur, but they usually clear up readily on cessation of treatment.

Patients with psoriasis appear to be more susceptible to skin reactions than others.

Small children are particularly sensitive to the 4-aminoquinolines, therefore patients should be warned to keep Plaquenil out of reach of children.

Other adverse effects include gastro-intestinal disturbances such as nausea, diarrhoea, anorexia, abdominal cramps or, rarely, vomiting. These symptoms usually stop immediately on reducing the dose or on temporarily stopping the treatment. Less frequently, muscle weakness, vertigo, tinnitus, nerve deafness, headache, nervousness and emotional upsets have been reported. Patients should be carefully supervised in view of reports of peripheral neuropathy and toxic psychosis with other 4-aminoquinoline compounds.

Overdosage: The symptoms of massive overdosage may include headache, visual disturbances, cardiovascular collapse, and convulsions, followed by sudden and early respiratory and cardiac arrest.

Since these effects may appear soon after taking massive dose, treatment should be prompt and symptomatic. The stomach should be immediately evacuated either by emesis or by gastric lavage. If convulsions are present, they should be controlled before the stomach is emptied by:

1. An ultra-short-acting barbiturate if due to cerebral stimulation, or
2. The administration of oxygen, or by artificial respiration is due to anoxia, or
3. By vasopressor therapy if due to shock hypotension.

A patient who survives the acute phase and asymptomatic should be closely observed for at least 5

rs. Fluids may be forced and sufficient ammonium oride may be administered to acidify the urine for a v days to hasten urinary excretion. Alternatively tereaprol can be given by intramuscular injection 1–3 mg/kg body weight four to six times a day for ee days, then every 12 hours for 10 days). Ammonium oride is also useful in patients who show toxic nptoms due to sensitivity to the drug. Recovery under treatment has followed the ingestion 36 Plaquenil Tablets while an estimated dose of 54 lets has proved rapidly fatal.

Pharmaceutical precautions Nil.

Legal category POM.

Package quantities Plaquenil is supplied in bottles of 0 tablets.

Further information Nil.

Product licence number 0071/5083.

ROMINAL*

Presentation Prominal Tablets 30 mg are white, biconvex tablets, 6.4 mm in diameter, marked P30 on one side and plain on the other. Each tablet contains 30 mg ethylphenobarbitone BP.

Prominal Tablets 60 mg are white, biconvex tablets, 11 mm in diameter, marked P60 on one side and plain on the other. Each tablet contains 60 mg methylphenobarbitone.

Prominal Tablets 200 mg are white, bi-convex tablets, 13.3 mm diameter, marked P200 on one side and plain on the other. Each tablet contains 200 mg methylphenobarbitone.

Uses Prominal Tablets are recommended for the treatment of epilepsy.

Dosage and administration *Adults:* For epilepsy the usual dosages, which must be fixed individually, range from 100 to 600 mg, the average being 200–400 mg. It is recommended that sedative dosages range from 30 to 100 mg daily.

Contra-indications, warnings, etc

Contra-indications: Acute intermittent porphyria and patients who are hypersensitive or who exhibit idiosyncrasy to barbiturates.

Precautions: The possibility of tolerance or dependence developing should be considered. Abrupt cessation of treatment may give rise to withdrawal symptoms. Use with caution in senile or debilitated patients. Large doses should not be given to those with renal or liver damage. Severe pulmonary insufficiency, even normal therapeutic doses may depress respiration. Barbiturates may potentiate the central depressant effect of alcohol and affect the action of a number of other drugs.

Anticonvulsant drugs are as useful to an epileptic during pregnancy as they are at other times and for the individual epileptic mother the chance of an abnormal baby due to drug treatment is small. However, a number of reports have appeared in the literature suggesting the possible implication of the epileptic state, anticonvulsants and folic acid deficiency as causative agents in certain congenital abnormalities. Scientific knowledge does not yet permit an adequate definition to be made of the respective roles of these three factors. It is recom-

mended, therefore, that if anticonvulsants are judged necessary during pregnancy, adequate folic acid supplements should be given and the epilepsy controlled as completely as possible.

Overdosage: Where patients are seen within four hours of taking an overdose, gastric aspiration or lavage may be beneficial in adults, while children who are conscious may be given an emetic, e.g. Syrup of Ipecacuanha.

The prime objective in treating methylphenobarbitone overdose is to maintain vital function (respiration, cardiovascular and renal function, and electrolyte balance) while the majority of the drug is metabolised by hepatic enzymes. At the same time some of the drug is excreted unchanged by the kidneys. Given normal renal function, this latter process may be enhanced by alkaline diuresis, maintaining the urinary pH at about 8 by appropriate intravenous infusion. In severe cases, haemodialysis may help, but extracorporeal haemoperfusion is probably more effective.

Side Effects: Drowsiness, sedation unsteadiness, vertigo and inco-ordination may occur. During the first week of administration, performance and alertness may be impaired; patients should be warned not to drive or operate machinery if affected. These effects may be potentiated by alcohol. Other adverse reactions may include a 'hang-over' effect, paradoxical excitement, confusion, memory defects and skin rashes in patients who may be sensitive to this type of drug.

Pharmaceutical precautions Nil.

Legal category POM.

Package quantities Prominal Tablets (30 mg, 60 mg and 200 mg) are supplied in bottles of 100.

Prominal Tablets 60 mg	0071/5085
Prominal Tablets 200 mg	0071/5086

PYROGASTRONE*

Presentation White, round, strawberry-flavoured chewable tablets. 22.2 mm in diameter, marked with a symbol on one side and PG on the other. Each tablet contains:

Carbenoxolone Sodium BP	20 mg
Magnesium Trisilicate BP	60 mg
Dried Aluminium Hydroxide Gel BP	240 mg

in a base containing 210 mg Sodium Bicarbonate BP and 600 mg Alginate Acid BP.

Uses For the treatment of oesophageal inflammation, erosions and ulcers due to hiatus hernia or other conditions causing gastric reflux and for the relief of heartburn, flatulence and other symptoms associated with reflux oesophagitis.

Dosage and administration For oral administration only.

Adults: 1 tablet to be chewed three times daily immediately after meals and 2 tablets to be chewed at bedtime.

Treatment should be continued for at least six weeks, but up to 12 weeks treatment may be necessary to ensure maximum healing effect.

Contra-indications, warnings, etc Pyrogastrone

should not be prescribed for patients suffering from severe cardiac, renal or hepatic failure. Nor should it be prescribed for patients on digitalis glycosides unless serum electrolyte levels are monitored at weekly intervals to detect promptly the development of hypokalaemia.

Special care should be exercised with patients predisposed to sodium and water retention, potassium loss and hypertension (e.g. the elderly and those with cardiac, renal and hepatic disease) since the carbenoxolone content of Pyrogastron can induce similar changes. Potassium supplements should be considered for those at risk from developing hypokalaemia.

Regular monitoring of weight and blood pressure which should indicate the development of such effects is advisable for all patients. A thiazide diuretic should be administered if oedema or hypertension occurs (spironolactone or amiloride should not be used because they hinder the therapeutic action of carbenoxolone). Potassium loss should be corrected by the administration of oral supplements.

No teratogenic effects have been reported with carbenoxolone sodium, but careful consideration should be given before prescribing Pyrogastron for women who may become pregnant.

Overdosage: If the tablets have been recently ingested, the stomach should be emptied by gastric lavage. Serum electrolytes should be monitored and any deficiency in potassium should be corrected, using the intravenous route if necessary or slow-release or effervescent tablets of potassium chloride. Water retention and sodium balance should be corrected by means of a diuretic. (Spironolactone or amiloride would appear to be a logical choice).

Pharmaceutical precautions Store in a dry place.

Legal category POM.

Package quantities Boxes containing 25 foil strips of 4 tablets.

Further information The alginate antacid base of Pyrogastron tablets forms a clinging viscous foam which has buffering capacity. This relieves symptoms, either by coating the oesophageal wall, by impeding oesophageal reflux, or the foam may reflux instead of the acid gastric contents. The incorporation of carbenoxolone into the formulation has been shown to exert an additional healing effect on oesophageal ulcers possibly by improving mucus synthesis and/or by increasing the life-span of oesophageal epithelium.

Although Pyrogastron quickly relieves symptoms, treatment should be continued for at least six weeks, but up to 12 weeks' treatment may be necessary to ensure a maximum healing effect.

Made under licence from Biorex Laboratories. Brit. Pat. No. 1390683.

Product licence number 0071/0138.

RESONIUM* A

Presentation Resonium A is ground and flavoured sodium polystyrene sulphonate. It is a buff-coloured powder with a pleasant vanilla odour and sweet taste.

Uses Resonium A is an ion-exchange resin which is recommended for the treatment of hyperkalaemia associated with anuria or severe oliguria. It is also used to treat hyperkalaemia in patients requiring dialysis and in

patients on regular haemodialysis or on prolonged peritoneal dialysis.

Dosage and administration Resonium A is for oral or rectal administration only. The dosage recommendations detailed in this section are a guide only; the precise requirements should be decided on the basis of regular serum electrolyte determinations.

Adults:

1. **Oral:** Usual dose 15 g three or four times a day. The resin is given by mouth in a little water, or it may be made into a paste with some sweetened vehicle.

2. **Rectal:** In cases where vomiting may make oral administration difficult, the resin may be given rectally as a suspension of 30 g resin in 100 ml 2% methylcellulose (medium viscosity) and 100 ml water, as a daily retentive enema. In the initial stages administration by this route as well as orally may help to achieve a more rapid lowering of the serum potassium level.

The enema should if possible be retained for at least nine hours. If both routes are used initially it is probably unnecessary to continue rectal administration once the oral resin has reached the rectum.

Children: 1 g/kg body weight daily in divided doses for acute hyperkalaemia. Dosage may be reduced to 0.5 g/kg body weight in divided doses for maintenance therapy.

The resin is given orally, preferably with a drink or little jam or honey. When refused by mouth it should be given rectally, using a dose at least as great as that which would have been given orally.

Contra-indications, warnings, etc The possibility of potassium depletion should be considered and adequate biochemical control is essential during treatment. Administration of the resin should be stopped when the serum potassium level falls to 5 mmol/litre.

Overdosage: In the event of overdosage the resin should be removed from the alimentary tract by the use of laxatives or enemas and appropriate measures taken to restore serum potassium levels to normal.

In patients with severe renal damage the sodium ion liberated by Resonium A may lead to sodium overload and congestive heart failure. In such cases Calcium Resonium (calcium polystyrene sulphonate) may be used in place of Resonium A.

Pharmaceutical precautions It is suggested that Resonium A should not be administered in fruit squashes since these have a high potassium content.

Legal category P.

Package quantities Lever-lid tins containing 454 g Resonium A together with a 15 g plastic spoon.

Further information Nil.

Product licence number 0071/5087.

ROCCAL* ANTISEPTIC ROCCAL* CONCENTRATE 10X

Presentation Roccal Antiseptic and Roccal Concentrate 10X are clear blue solutions containing 1% or 10% benzalkonium chloride respectively. The solutions, when shaken, have a characteristic antiseptic odour and are miscible with water in all proportions.

Uses Roccal is recommended for use as an antiseptic in wound cleansing (including cuts, bites and abrasions)

or sterilisation of dressings, breast and nipple shield hygiene, vaginal douching and as a bladder washout. It may also be used as a skin antiseptic and as a general disinfectant.

Dosage and administration Roccal is for topical use only. The following dilutions of Roccal Antiseptic are recommended for the uses indicated.

Use	Concentration of benzalkonium chloride	Dilution of Roccal
Bladder washout	1:5,000 to 1:20,000	1:50 to 1:200
Breast and nipple shield hygiene ect.	1:1,000 to 1:2,000	1:10 to 1:20
Dressings General	1:4,000	1:40
disinfectant	1:1,000 to 1:8,000	1:10 to 1:80
Skin disinfectant	1:1,000 to 1:2,000	1:10 to 1:20
Vaginal douching	1:2,000 to 1:5,000	1:20 to 1:50
Wound cleansing including cuts, bites and abrasions	1:1,000 to 1:5,000	1:10 to 1:50

Roccal Concentrate 10% is intended for the preparation of Roccal Antiseptic only, by diluting 1 in 10 with water.

Contra-indications, warnings, etc Roccal should not be mixed with strong soap solution or with antiseptics containing soap such as solutions of chloroxylenol, lysol, the black and white fluids or with products containing anionic detergents such as pHiso-MED.

Roccal appears to be relatively non-irritant to skin and mucous membranes. Although benzalkonium chloride may be used as a preservative for eye drops Roccal is not recommended for use in the eyes because of the additives it contains. The presence of benzalkonium chloride in a urine sample may give rise to a false-positive result in tests for protein.

Accidental ingestion: The oral toxic dose of benzalkonium chloride is estimated to be between 1 and 3 g. The main signs of poisoning are vomiting, collapse and coma. Roccal acts primarily as a local irritant on the throat, oesophagus and gastro-intestinal tract. Toxic doses lead to restlessness, apprehension, dyspnoea, cyanosis, convulsions, muscle weakness and death due to paralysis of respiratory muscles.

Treatment consists of giving milk, egg whites or even a mild soap solution by mouth, followed by emesis or gastric lavage with a weak soap solution. Respiration should be supported by oxygen or artificial respiration if necessary.

Convulsions should be treated by short-acting barbiturates. Central nervous system stimulants are usually ineffective.

Pharmaceutical precautions The potency of a 10% solution of benzalkonium chloride is unchanged even after 10 years of storage. Roccal may be boiled or autoclaved without loss of bactericidal activity as shown by phenol coefficient determinations. The efficacy of solutions of Roccal is not affected by freezing and subsequent thawing.

Dilutions of Roccal should not be prepared with tap

water due to possible interference by certain cations such as calcium, magnesium, iron and aluminium.

Roccal 1:10 (benzalkonium chloride 1:1,000) is compatible with the following substances:

Acriflavine	Natural rubber
Adrenaline	Oil of sassafras 1.5–2.5%
Alcohol	Oxytetracycline
Amethocaine NCI	Penicillin
Benzocaine	Phenol
Boroglycerin	Phenylephrine HCl
Camphor	Pilocarpine (2% solution or less)
Carbachol	Polyethylene glycol
Chlorbutol 1:5,000	Procaine HCl
Cocaine	Resorcin (cloudy when mixed)
Cresol	Rose water
Eosin	Scopolamine
Ephedrine HCl	Sodium bicarb. and phosphate
Eserine sulphate (not salicylate salt)	Sodium carbonate and sodium nitrate
Formaldehyde 1%	Sulphadiazine sodium
Fuchsin	Sulphanilamide
Glycerin 5–15%	Trisodium phosphate
Homatropine 5%	Urea
Hydrazine hydrate 0.1–0.5%	Urethane
Lime water	Zinc chloride (up to and including 1%)
Mercurial salts 1%	
Methylene blue	
Methylparaben	

But incompatible with these substances:

Aluminium	Citric acid
Benzylephedrine	Ethylparaben
Boric acid 5%	Fluorescein sodium
Caramel	Hydrogen peroxide
Iodine	Sodium citrate and tartrate
Kaolin	Sodium lauryl sulphate
Lanolin	Sulphapyridine
Mild silver proteinate	Sulphathiazole
Physostigmine	Sulphathiazole sodium
Pilocarpine nitrate (3% or more)	Synthetic rubber (some)
Pine oil	Tartaric acid
Potassium iodine	Yellow oxide of mercury
Potassium permanganate	Zinc oxide
Saponin 0.1–0.5%	Zinc peroxide
Silicates	Zinc sulphate
Silver salts	

Legal category GSL.

Package quantities Roccal Antiseptic is supplied in glass bottles containing 250 ml or 500 ml, or in translucent plastic bottles containing 2.25 litres.

Roccal Concentrate 10X is supplied in translucent plastic bottles containing 2.25 litres or amber glass bottles containing 4.54 litres.

Further information Nil.

Product licence numbers

Roccal Antiseptic 0071/5088

Roccal Concentrate 0071/5089

SEOMINAL*

Presentation Seominal Tablets are pale yellow, bi-convex tablets, 10.3 mm in diameter, marked III on one side and scored on the other. Each tablet contains 10 mg Phenobarbitone BP, 325 mg Theobromine BP and 0.2 mg Reserpine BP.

Uses Seominal Tablets are recommended for the treatment of mild to moderate essential hypertension.

Dosage and administration *Adults:* The average initial dosage of Seominal is 1 tablet twice daily, or for the more severe cases, three times daily, but the possibility of excessive sedation must be borne in mind. This dosage is continued until improvement has been maintained for some time.

Thereafter the daily dosage may be reduced to 1 tablet. Some patients may even discontinue with the drug for a time.

It must be emphasised that, because of the slow onset of hypotensive action, no improvement in blood pressure readings may be observed for a month or so, although a tranquillising effect may be apparent within a few days. Thereafter Seominal should be continued for some weeks in full dosages.

Contra-indications, warnings, etc

Contra-indications: Seominal should not be used for patients with anxiety or depression or in those with gastric ulceration, cardiac arrhythmia, myocardial infarction or renal failure. It should not be given with MAO inhibitors. It may cause severe hypotension in patients who have recently suffered strokes.

It is also contra-indicated in acute intermittent porphyria and in those who are hypersensitive or exhibit an idiosyncrasy to barbiturates.

Precautions: Some patients exhibit idiosyncrasy to barbiturates, and such individuals' response to these compounds is likely to be restlessness and excitement even in the absence of pain. Skin reactions are the most common type of allergic manifestation. Barbiturates should be used with caution in debilitated or senile patients. Large doses should not be given to patients with renal impairment or with diseases of the liver. In severe pulmonary insufficiency, even normal doses of barbiturates may depress the respiration.

The possibility of tolerance or dependence developing should be considered. Abrupt cessation of treatment in these circumstances may give rise to withdrawal symptoms. Barbiturates may potentiate the central depressant effect of alcohol and affect the action of a number of other drugs, by hepatic enzyme induction including coumarin type anticoagulants, septemic steroids (including oral contraceptives), phenytoin, griseofulvin, rifampicin, phenothiazines and tricyclic antidepressants.

Overdosage: There have been no reports of overdosage with Seominal. Symptoms of acute toxicity would probably be those caused by the individual ingredients. Theobromine could cause gastro-intestinal disturbances, haemorrhage, insomnia, tremor and convulsions. An overdosage of reserpine may produce diarrhoea, dizziness, fatigue, headache, nasal stuffiness, flushing, hypotension and bradycardia or tachycardia, Parkinsonism, convulsions, etc. Diphenhydramine may be used for the Parkinsonism and noradrenaline or phenylephrine for the hypotension.

Where patients are seen within four hours of taking an overdose, gastric aspiration or lavage may be beneficial in adults, while children who are conscious may be given an emetic, e.g. Syrup of Ipecacuanha.

The prime objective in treating phenobarbitone overdosage is to maintain vital functions (respiration, cardiovascular and renal function, and electrolyte balance) while the majority of the drug is metabolised by hepatic enzymes. At the same time some of the drug is excreted unchanged by the kidneys. Given normal renal function,

this latter process may be enhanced by alkaline diuresis maintaining the urinary pH at about 8 by appropriate intravenous infusion. In severe cases, haemodialysis may help, but extracorporeal haemoperfusion is probably more effective.

Diuresis will not hasten the excretion of theobromine or reserpine. Measures may be required to correct the hypotensive effect of reserpine, supportive measures including the head-down position, the intravenous infusion of plasma expanders and the administration of a vasopressor agent such as noradrenaline or dopamine may be indicated.

Side-effects: Minor reactions include excessive sedation, headache, dizziness, nasal stuffiness, dry mouth, nausea, diarrhoea or cutaneous eruptions. Lowering the dose or halting medication for a short time generally results in their disappearance. Mental depression is the most serious side-effect associated with reserpine. If depressive symptoms develop during treatment with Seominal the drug must be stopped, and if the depression does not resolve within a few days psychiatric advice should be sought.

Pharmaceutical precautions Nil.

Legal category POM.

Package quantities Seominal is available in bottles of 100 or 500 tablets.

Further information Nil.

Product licence number 0071/5090.

SOLPADEINE*

Presentation Solpadeine Tablets are flat, white, bevelled edged tablets which effervesce vigorously when placed in water. Each tablet is 25.4 mm in diameter and contains 500 mg Paracetamol BP, 8 mg Codeine Phosphate BP and 30 mg Caffeine BP.

Uses Solpadeine Tablets are recommended for the relief of pain in the treatment of rheumatic pain, sciatica and lumbago as well as in sprains and strains, headaches, sinusitis and influenza.

Dosage and administration *Adults:* 2 tablets dissolved in at least half a tumbler of water, taken three or four times a day if necessary.

Children: Children 7–12 years old may be given $\frac{1}{2}$ –1 tablet dissolved in water. Children should not be given doses of Solpadeine more frequently than every 4 hours and not more than 4 doses should be given on any 24-hour period.

Not suitable for children under 7 years of age.

Contra-indications, warnings, etc Solpadeine contains 425 mg sodium in each tablet. It should therefore be prescribed with caution in long-term treatment of patients with hypertension, cardiac or renal insufficiency, oedema of pregnancy or wherever a restricted salt intake is indicated.

There is epidemiological evidence of the safety of paracetamol in human pregnancy. Codeine has been used for many years without apparent ill consequences and animal studies have not shown any hazard.

Overdosage: Ingestion of an excessive number of Solpadeine Tablets is unlikely because of the size of the tablets and their effervescent nature.

Naloxone can be used to combat the depression due to codeine overdosage. An overdosage of paracetamol

can cause hepatic necrosis. Patients appear well for the first three days, then succumb with liver damage. The hepatic changes produced by overdosage of paracetamol appear to result from the accumulation of a highly reactive intermediate metabolite in the hepatocytes. N-acetyl-cysteine intravenously, or l-methionine orally, protects the liver if administered within 10 hours of ingesting an overdose.

Pharmaceutical precautions Solpadeine Tablets should be protected from light and moisture.

Legal category P.

Package quantities Solpadeine Tablets are packed in laminate strips and supplied in boxes of 12, 24 and 60 tablets.

Further information Nil.

Product licence number 0071/5091.

SULFAMYLYL* CREAM

Presentation Sulfamylon Cream is a smooth, white to pale yellow, water-miscible cream with a slight acetous odour and containing 8.5% w/w mafenide as the acetate.

Uses Sulfamylon Cream is recommended for the prophylaxis and treatment of infection, particularly that due to *Pseudomonas* species in second and third degree burns.

Dosage and administration Sulfamylon Cream is for topical use only.

Adults: Sulfamylon Cream should be applied to a thickness of 1–2 mm (a layer sufficient to prevent seeing the burn surface), once or twice daily with a sterile gloved hand. Any covering lost owing to a change of body linen or a shift of position should be replaced by further applications. In the first 24 hours of the post-burn period the wound is moist and exudative and may require more frequent applications. Dressings are not usually required, but if necessary a thin layer of gauze may be used.

The length of treatment will depend on the rate of separation of the eschar and the appearance of the granulating surface necessary for skin grafting. Duration of treatment may vary from five days to three to four weeks.

Children: The product should be applied according to the recommendations for adults.

Contra-indications, warnings, etc Sulfamylon Cream should not be used if the patient has a known sensitivity to mafenide or any other sulphonamide. It is not known if there is cross-sensitivity to other sulphonamides. It should be used with care in patients with known pulmonary dysfunction. If persistent acidosis occurs, treatment should be suspended for 24–48 hours, when continuous fluid therapy will usually restore acid-base balance.

Fungal colonisation in and below the eschar may occur concomitantly with reduction of bacterial growth in the burn wound. However, fungal dissemination through the infected burn wound is rare.

As is the case with all preparations, the need for treatment during pregnancy should be carefully weighed against any possible risk to the foetus. Occasionally application of the cream may be accompanied by pain or a burning sensation severe enough to require an analgesic or sedation. Allergic manifestations, such as

maculopapular rash, oedema, erythema and eosinophilia, also occur in a small portion of patients.

Pharmaceutical precautions Store in cool, not refrigerated conditions, and protect from light. The cream has an estimated shelf-life of 12 months. The normal precautions involved in aseptic dressing should be observed to prevent contamination. It is recommended that each patient should have an individual jar of cream and any cream remaining after 24 hours should be discarded.

Legal category POM.

Package quantities Black plastic jars each containing 500 g.

Further information Nil.

Product licence number 0071/5093.

SULFOMYL*

Presentation Sulfomyl is a clear, colourless solution in a dropper-bottle presentation. The solution contains 5% w/v mafenide propionate and has an odour of chlorbutanol.

Uses Sulfomyl is recommended for the treatment of superficial eye infections.

Dosage and administration *Adults: First-aid for minor eye injuries:* 3 or 4 drops are instilled into the injured eye.

Established infection: 3 or 4 drops are instilled into the eye three or four times a day.

Children: The adult dosage recommendations may be followed for children.

Contra-indications, warnings, etc Although no instances of allergy or irritation have been reported with Sulfomyl Eye Drops, they should not be used in patients known to be sensitive to other sulphonamides.

Pharmaceutical precautions Nil.

Legal category P.

Package quantities Polythene drop bottles each containing 10 ml.

Further information Nil.

Product licence number 0071/5094.

TRANCOPAL

Presentation Trancopal tablets are flat, yellow tablets with bevelled edges 9.5 mm in diameter, marked with a symbol on one side and plain on the reverse. Each tablet contains 200 mg chlormezanone.

Uses Trancopal tablets are recommended for the short-term treatment of insomnia. They are also recommended for the symptomatic treatment of anxiety states where muscle tension is prominent and as an adjunct to the treatment of acute musculo-skeletal disorders associated with painful muscle spasm.

Dosage and administration For oral administration only.

Adults: Sleep disturbances: usually 400 mg at night.

States of anxiety and skeletal muscle tension: usually 200 mg repeated up to 3 or 4 times daily or a single dose of 400 mg at night.

Elderly: Half the normal adult dose or less may be sufficient for a therapeutic response in the elderly.

Children: Not recommended.

Contra-indications, warnings, etc Trancopal tablets are contra-indicated in patients sensitive to chlormezanone and in those taking monoamine oxidase inhibitors. There is insufficient evidence of safety of chlormezanone in human pregnancy but it has been in use for many years without apparent ill consequences; animal studies have not shown hazard. However, do not use during pregnancy, especially the first trimester, unless there are compelling reasons.

Trancopal at high doses may modify the patient's reactions (performance at skilled tasks, alertness, etc.) to a varying extent, depending on individual susceptibility. Therefore, patients should be advised not to drive or operate machinery during treatment, if affected. If Trancopal is administered with CNS depressants, it is possible that their sedative effect may be intensified. As with other drugs acting on the central nervous system, patients should avoid alcohol while receiving Trancopal since the response cannot be predicted.

Trancopal should be given with caution to patients with hepatic or renal insufficiency.

Overdosage: The signs and symptoms of overdosage with chlormezanone resemble those seen with other central depressant drugs, for example, somnolence, prostration, muscular incoordination and memory disturbances. In severe cases, there may be hypotension, respiratory depression and loss of consciousness.

Symptomatic treatment should follow gastric lavage.

Side effects: Drowsiness and dizziness have been the commonest side effects, particularly at higher doses. Other reported side effects include nausea, lightheadedness, headache, lethargy, skin rashes and dryness of the mouth. Cholestatic jaundice has occurred.

The dependence potential of chlormezanone is no known.

Pharmaceutical precautions Nil.

Legal category POM.

Package quantities Trancopal tablets are available in bottles of 60.

Further information Nil.

Product licence number 0071/5098.

**Trade Mark*

Wyeth Laboratories

Huntercombe Lane South
Taplow
Maidenhead, Berks

ALUDROX*

Presentation Aludrox Gel consists of Aluminium Hydroxide Mixture BP containing the equivalent of 3.5–4.4% w/w Al_2O_3 presented as a white gel with the odour and flavour of peppermint.

Aludrox Tablets are white, flat, bevelled-edge tablets, 16 mm in diameter, marked ALUDROX on one face and WYETH on the other face. Each tablet contains 375 mg aluminium hydroxide (present in 750 mg aluminium hydroxide-sucrose stable mixture).

Uses Aludrox Tablets and Gel are antacid preparations indicated for the relief of hyperacidity, particularly that associated with peptic ulceration and dyspepsia. They may also be prescribed in the treatment of hyperphosphataemia.

Dosage and administration Route of administration: Oral.

Dosage – Adults: For antacid use:

Tablets: 2 tablets half an hour after meals and on retiring. The tablets should be chewed before swallowing.

Gel: Two 5 ml doses four times daily between meals and on retiring.

In hyperphosphataemia: Larger doses may be given according to the requirements of the patient.

Children: Not recommended in infancy. Otherwise proportional to adult dosage for 70 kg adult.

Contra-indications, warnings, etc

Contra-indications: The aluminium ion combines with phosphate to form an insoluble complex which is not absorbed, and when high doses are given together with a low phosphorus diet phosphate depletion occurs. This regime is used in the treatment of phosphate calculi and hyperphosphataemia associated with chronic renal failure, although phosphate depletion does not occur in patients on a normal diet. Aludrox is contra-indicated in patients with hypophosphataemia.

Precautions:

1. Aluminium hydroxide may form a complex with tetracyclines and reduce absorption when given concomitantly.
2. Aluminium hydroxide may reduce absorption of digoxin.

Side-effects: Few side effects are to be expected. In some patients constipation may develop, but this is easily overcome by the administration of a suitable laxative preparation or by the joint administration of magnesium hydroxide.

Pharmaceutical precautions Store in a cool place. Where necessary dispense Aludrox Gel into suitable well-closed glass or polythene bottles.

Legal category GSL.

Package quantities Aludrox Tablets: Boxes of 60.

Aludrox gel: Polythene bottles of 200 ml, 500 ml, and 2 litres.

Further information There is no evidence to suggest that Aludrox Gel (or tablets) should not be given to breast-feeding mothers.

Product licence numbers

Aludrox Gel 0011/5000

Aludrox Tablets 0011/5001

APISATE*

Presentation Apisate tablets are two-layer tablets of 11.0 mm diameter. Both layers are yellow, the lighter coloured face is marked WYETH, the other face is plain. Each tablet contains:

Diethylpropion hydrochloride (in a sustained action formulation)	75 mg
Thiamine Hydrochloride BP	5 mg
Riboflavine BP	4 mg
Pyridoxine Hydrochloride BP	2 mg
Nicotinamide BP	30 mg

Uses Apisate, containing diethylpropion hydrochloride, in a sustained action formulation, with a supplement of B-complex vitamins, is designed to give anorectic activity throughout the waking hours.

Apisate is suitable for treatment of patients with moderate to severe obesity for whom dietary supervision is also provided.

Dosage and administration Route of administration: Oral.

Dosage – Adults: Dosage depends on eating habits. Most patients require only one tablet a day, taken early morning or mid-afternoon. Some patients however, may require 2 tablets; one at each of these two times.

Children: Not recommended for children under 12 years of age.

Current medical opinion supports intermittent use of appetite suppressants. Apisate may be given 4–8 weeks followed by a similar period without medication.

Contra-indications, warnings, etc

Contra-indications:

1. Use in emotionally unstable individuals, including psychotics, who are known to be susceptible to alcohol or drug abuse.
2. Use in patients concomitantly treated with MAOIs or within two weeks of such treatment.
3. Use of diethylpropion is also contra-indicated in patients with advanced arteriosclerosis, hyperthyroidism, severe hypertension, glaucoma or idiosyncrasy to sympathomimetic amines.
4. Concurrent use with other appetite suppressant drugs.

Precautions: 1. Prolonged use of diethylpropion may induce dependence with a withdrawal syndrome on cessation of therapy. Several cases of toxic psychoses have been reported after excessive use of diethylpropion and a very small number have been reported in which the recommended dosage appears not to have been exceeded. The psychosis was temporary and cleared up when the drug was discontinued. Patients should be advised not to exceed the stated dose.

2. Efficacy in use for more than 6 months, and safety in long term use have not been established. Longer term use may carry an increased risk of dependence.

Since its introduction in 1958, diethylpropion has been used by at least 33,000,000 patients. Against this background of extensive clinical use, reports of abuse have been very rare. Most of the subjects who abused diethylpropion had previously misused other drugs, e.g. amphetamine or phenmetrazine, and many were described as having unstable personalities.

3. Diethylpropion should be used with caution in patients with hypertension, angina pectoris, cardiac arrhythmias and peptic ulceration. Caution should also be observed in patients with epilepsy, anxiety or tension states or severe depression.

4. This product should be regarded as an adjunct in weight reduction, the primary management of which depends on dietary control. Administration of Apisate should not be continued if weight loss does not occur.

5. Diethylpropion may interact with sympathomimetic agents. Care should be taken when treating hypertensive patients receiving hypotensive drugs. Animal experiments suggest that anti-obesity agents can block or reverse the actions of such agents when taken together. Diethylpropion should not be given concurrently with psychotropic drugs, including sedatives.

6. Apisate should not be administered during pregnancy or lactation unless in the judgement of the physician such administration is clinically justifiable. Special care should be taken in the first three months of pregnancy.

7. Patients should be warned against driving or operating machinery until it is established that they are not over-stimulated while taking Apisate.

Side-effects: Diethylpropion has negligible effect on blood pressure, pulse rate or cardiac activity. Side-effects are infrequent and rarely severe enough to require discontinuation of treatment. They include sleeplessness, restlessness, increased nervousness, euphoria, agitation, palpitations, depression, psychosis, hallucinations, dependence, nausea, vomiting, dry mouth, headache, tachycardia, constipation and allergic rashes. Gynaecomastia has been reported rarely.

Overdosage: A few unsuccessful suicide attempts by deliberate overdosage of diethylpropion hydrochloride have been reported in adults. Dosage ranged from 450 to 2,250 mg. Transient sequelae included semi-coma or coma, lethargy, increased irritability and nausea.

A number of cases of accidental overdosage have been reported in children aged 6 months to 3½ years. Known doses taken were from 50 to 1,100 mg. The most frequent effects were motor hyperactivity, excitability, tachycardia, rapid respiration, pupillary dilatation, and flushing.

Treatment of overdosage is initially by gastric lavage and close observation. The foregoing reports show that individual reactions may differ and further treatment will be symptomatic.

Recovery occurred in all patients with overdosage

except one, in whom treatment with a large intravenous dose of sodium amobarbital was implicated.

Pharmaceutical precautions Store in a cool dry place, keep tightly closed. Where necessary dispense into suitable, well-closed glass bottles.

Legal category POM.

Package quantities Bottles of 100.

Further information Diethylpropion, including illegally manufactured tablets have been the subject of social abuse for euphoriant effect.

Product licence number 0011/5004.

ATIVAN* TABLETS

Presentation Ativan tablets are capsule shaped containing 1 mg or 2.5 mg lorazepam, approximately 4 × 8 mm with WYETH on one side and a break bar on the other. The 2.5 mg tablets are yellow and the 1 mg tablets are blue. Both are supplied in a blister pack.

Uses Ativan is indicated for the following: mild, moderate and severe anxiety states, phobic or obsessional states, moderate to severe tension states, anxiety in psychosomatic, organic or psychotic illness, insomnia associated with anxiety, premedication before operative dentistry and as a sedative for the anxious dental patient, premedication before general surgery.

Dosage and administration Route of administration: Oral.

Dosage: Adults: Mild anxiety – 1–4 mg daily in divided doses.

Moderate/severe anxiety – up to 8 mg daily in divided doses.

Severe anxiety, phobic or obsessional/compulsive state – up to 10 mg daily.

Insomnia – 1–4 mg before retiring.

Premedication – 2–3 mg the night before operation, 2–4 mg one or two hours before operation.

Elderly: The elderly may respond to lower doses and half the normal adult dose or less may be sufficient.

Children: Not recommended for children.

Dentistry: 1–2.5 mg, 1½–2 hours before dental treatment. For operative dentistry dosage as for premedication.

Contra-indications, warnings, etc

Contra-indication: Ativan should not be given to patients with a previous history of sensitivity to benzodiazepines.

Precautions and warnings: 1. Concomitant administration with central nervous system depressants, including alcohol, general anaesthetics, narcotic analgesics, monoamine oxidase inhibitors and antidepressants will result in an accentuation of their effects.

2. Prolonged or excessive use of benzodiazepines may occasionally result in the development of some psychological dependence with withdrawal symptoms on sudden discontinuation. This is more likely in patients with a history of alcoholism, drug abuse or in patients with marked personality disorders.

Treatment in all patients should be withdrawn gradually. Careful monitoring of all patients is essential.

3. As with other drugs acting on the central nervous system, patients should be cautioned against driving or operating machinery until it is established that they do not become dizzy or drowsy while taking lorazepam.

4. Ativan tablets should not be administered during pregnancy or lactation unless in judgement of the physician such administration is clinically justifiable. Special care should be taken in the first three months of pregnancy.

5. This product should be used with caution in patients with impairment of renal or hepatic function.

6. Elderly patients or those suffering from cerebral vascular changes such as arteriosclerosis are likely to respond to smaller doses.

7. Ativan should be used with caution during labour. Respiratory depression, poor sucking and hypothermia in the neonate have occasionally been reported especially in patients who are at high risk.

8. Ativan does not depress respiration in most patients but the drug should be used with caution in patients with acute or chronic pulmonary insufficiency.

9. The use of benzodiazepines may release suicidal tendencies in depressed patients. Other rarely reported behavioural effects of the benzodiazepines include paradoxical aggressive outbursts, excitement and confusion.

Overdosage: As with other benzodiazepines, overdosage should not present a threat to life. General supportive measures should be used. Treatment is symptomatic and gastric lavage may be of use if performed shortly after ingestion. If the patient is conscious, an emetic such as ipecacuanha may be given. The patient is likely to sleep and a clear airway should be maintained.

Side-effects: Ativan is well tolerated and imbalance or ataxia is an indication of excessive dosage. Daytime drowsiness may be seen initially and is to be anticipated in the effective treatment of anxiety. It will normally diminish rapidly and may be minimised in the early days of treatment by giving the larger proportion of the day's dose before retiring.

Occasional confusion, hangover, headache on waking, dizziness, blurred vision and nausea have also been reported.

Pharmaceutical precautions Store in a cool dry place.

Legal category POM.

Package quantities 1 mg and 2.5 mg tablets are supplied in boxes of 100 (5 × 20).

Further information Ativan is a short acting benzodiazepine. It is rapidly absorbed from the gastro-intestinal tract and is metabolised by a simple one-step process to a pharmacologically inactive glucuronide. The elimination half-life of Ativan is about 12 hours so that steady state plasma levels are quickly reached and there is minimal risk of excessive accumulation, giving a wide margin of safety.

Tablets 2.5 mg 0011/0036

ATIVAN* INJECTION ▼

Presentation Ativan injection is a clear, colourless solution containing lorazepam at a concentration of 4 mg/ml supplied in 1 ml quantities in clear glass ampoules.

Uses Ativan injection is indicated for:

• Pre-operative medication or premedication for uncom-

fortable or prolonged investigations, e.g. bronchoscopy, arteriography, endoscopy.

The treatment of acute anxiety states, acute excitement or acute mania. The control of status epilepticus.

Dosage and administration *Route of administration:*

Ativan injection can be given intravenously or intramuscularly. However, the intravenous route is to be preferred. Care should be taken to avoid injection into small veins and intra-arterial injection.

Absorption from the injection site is considerably slower if the intramuscular route is used and as rapid an effect may be obtained by oral administration of Ativan tablets.

Preparation of the injection: Ativan injection is slightly viscous when cool. To facilitate injection it may be diluted 1:1 with normal Saline or Water for Injections BP immediately before administration. If given intramuscularly it should always be diluted.

Ativan injection is presented as a 1 ml solution in a 2 ml ampoule to facilitate dilution.

Ativan injection should not be mixed with other drugs in the same syringe.

Dosage:

1. **Premedication:** 0.05 mg/kg (3.5 mg for an average 70 kg man). By the intravenous route the injection should be given 30–45 minutes before surgery when sedation will be evident after 5–10 minutes and maximal loss of recall will occur after 30–45 minutes. By the intramuscular route the injection should be given 1–1½ hours before surgery when sedation will be evident after 30–45 minutes and maximal loss of recall will occur after 60–90 minutes.

2. **Anxiety:** 0.025–0.03 mg/kg (1.75–2.1 mg for an average 70 kg man). Repeat 6 hourly. Ativan injection is not recommended for children under 12.

3. **Status epilepticus:** Adults: 4 mg intravenously. Children: 2 mg intravenously.

Contra-indications, warnings, etc

Contra-indications:

1. Ativan injection should not be given to patients with a previous history of sensitivity to the benzodiazepines.

2. Ativan injection is not recommended for out-patient use unless the patient is accompanied.

Precautions and warnings:

1. Patients should remain under observation for at least eight hours and preferably overnight.

2. Patients should not drive or operate machinery within 24 hours of administration of Ativan injection and should be advised not to take alcohol.

3. The effects of centrally acting cerebral depressant drugs may be potentiated.

4. This product should be used with caution in patients with impairment of renal or hepatic function.

5. The injection should be given slowly except in the control of status epilepticus where rapid injection is required.

6. Elderly patients may require a lower dosage.

7. Ativan injection should not be administered during pregnancy or lactation unless in the judgement of the physician such administration is clinically justifiable. Special care should be taken in the first three months of pregnancy.

Overdosage: As with other benzodiazepines, overdosage should not present a threat to life. General supportive measures should be used and the treatment of overdos-

age is symptomatic. The patient is likely to sleep and a clear airway should be maintained.

Side-effects: Ativan injection is well tolerated and imbalance or ataxia are signs of excessive dosage. Drowsiness may be an initial effect and is to be anticipated in the effective treatment of anxiety. It will normally diminish as treatment continues. Occasional confusion, hangover, headache on waking, drowsiness or dizziness, blurred vision and nausea have also been reported.

Pharmaceutical precautions Store in a refrigerator up to 8°C. Protect from light.

Legal category POM.

Package quantities 10 × 1 ml ampoules per pack.

Further information As with other benzodiazepines, Ativan crosses the placental barrier and foetal concentration will be the same as that in the mother. Ativan will be present in the milk of nursing mothers, but as with other benzodiazepines this is not significant if the mother is receiving Ativan injection within the recommended doses.

Ativan is metabolised by a simple one-step process to a pharmacologically inactive glucuronide. There is minimal risk of accumulation after repeated doses, giving a wide margin of safety. Ativan injection is compatible with a wide range of other drugs and has minimal effect on blood pressure and respiration. Tolerance at the injection site is good.

Product licence number 0011/0051.

BARATOL* ▼

Presentation Baratol tablets are round, convex, film coated tablets containing indoramin hydrochloride equivalent to 25 or 50 mg indoramin base. The 25 mg tablets are blue, 8.00 mm in diameter and marked WYETH on one face and '25' on the other. The 50 mg tablets are green, 9.5 mm in diameter, marked WYETH on one face and '50' on the other face which is also scored.

Uses *Actions:* Baratol is an alpha adrenoceptor blocking agent which acts selectively and competitively on post-synaptic alpha-1 receptors, causing a decrease in peripheral resistance.

Indications: Baratol tablets are indicated for the treatment of all grades of essential hypertension.

Dosage and administration

Initial dose: 25 mg twice daily for all patients.

Dose titration: The dosage of Baratol should be titrated as necessary to control blood pressure to a maximum of 200 mg daily in two or three divided doses. The daily dosage may be increased by the progressive addition of 25 mg or 50 mg, made at intervals of two weeks. When unequal doses are used, the largest dose should be given at night in order to avoid daytime sedation.

Combination with other anti-hypertensive agents: Baratol is effective in lowering blood pressure in all grades of hypertension, either used alone or when combined with other anti-hypertensive agents. The anti-hypertensive effect of Baratol is enhanced by concomitant administration of a thiazide diuretic or a beta-adrenoceptor blocking drug. Control of most cases of mild and moderate hypertension should be achieved by using Baratol alone or by adding Baratol to the regimen of a

patient already under treatment with a thiazide diuretic. In severe hypertension, a combination of Baratol, a thiazide diuretic and a beta-adrenoceptor blocking drug is effective in many such patients.

When Baratol is used in combination with other anti-hypertensive agents, the dose of Baratol should be titrated in the same way as when it is used alone.

Contra-indications, warnings, etc

Contra-indications: Baratol tablets should not be prescribed for:

1. Patients with established heart failure.
2. Patients already under treatment with MAOIs.

Precautions:

1. Drowsiness is sometimes seen in the initial stages of treatment with Baratol or when dosage is increased too rapidly. Patients should be warned not to drive or operate machinery until it is established that they do not become drowsy while taking Baratol.

2. Incipient cardiac failure should be controlled with diuretics and digitalis before treatment with Baratol.

3. Caution should be observed in prescribing Baratol for patients with hepatic or renal insufficiency or Parkinson's disease.

4. Animal experiments indicate no teratogenic effects but Baratol tablets should not be prescribed for pregnant women unless considered essential by the physician.

5. There is no data available on the excretion of Baratol in human milk but the drug should not be administered during lactation unless in the judgement of the physician such administration is clinically justifiable.

Side-effects: Sedation occurs in some patients but is rarely intolerable and is usually overcome by a modest reduction in dosage. Less commonly, dry mouth, nasal congestion, weight gain, dizziness, failure of ejaculation and depression have also been noted.

Treatment of overdose: There is no information available at present of the effects of acute overdose in humans with Baratol. The results of animal work suggest that toxic effects may include sedation, hypotension and hypothermia. In some species of animals fits have occurred at high doses.

In these circumstances suggested therapy is along the following lines:

1. Recent ingestion of large numbers of tablets would require lavage or a dose of ipecacuanha to remove any of the product still in the stomach of the conscious patient.

2. Temperature should be monitored and hypothermia treated appropriately.

3. Treatment of sedation should be by observation and the use of stimulants avoided.

4. Fits have not been seen in humans, but should they occur, the use of barbiturates should be avoided because of the potentiation of the sedative effect of Baratol.

Legal category POM.

Pharmaceutical precautions Store below 25°C and protect from light.

Package quantities Bottles of 100.

Further information Baratol is an alpha adrenoceptor blocking agent which acts selectively and competitively on post-synaptic alpha-1 receptors. It can be used in a wide range of patients. Baratol is one of a new class of alpha-blockers and offers considerable improvement over earlier non-selective alpha-blockers. It is especially suited for patients for whom beta-adrenoceptor blockade is contra-indicated, for example, in patients with a history of obstructive airways disease.

Reflex tachycardia is not associated with treatment with Barotal, probably because of a myocardial membrane-stabilising effect which prevents reflex acceleration of cardiac activity which was associated with the earlier non-selective alpha-blockers.

Postural hypotension is not a problem. Barotal has no effect on resistance vessels and shows no selectivity for veins in animals and humans and therefore venous pooling is not produced.

No mutually antagonistic interactions have been noted when patients are treated concomitantly with Barotal and a tricyclic antidepressant.

Barotal has been used concomitantly with cardiac glycosides and other anti-hypertensive drugs with no interaction. Rebound hypertension has not been observed after withdrawal of Barotal.

Selective alpha-1-blockade has been shown to be useful in the treatment of congestive heart failure. As yet, there is insufficient data to determine whether Barotal can also be indicated in this disorder. However, in hypertensive patients with cardiac insufficiency the selective alpha-blocking properties of Barotal may be beneficial.

0 mg tablets 0011/0058

DAVENOL

Presentation Davenol linctus is a clear, orange viscous liquid with not more than a slight turbidity, an odour of gingerine and a sweet taste. Each 5 ml dose contains:

holcodine BP	4 mg
phedrine Hydrochloride BP	7 mg
carbinoxamine maleate	2 mg

Uses Davenol is indicated in the treatment of all types of cough.

Dosage and administration Route of administration: Oral.

Dosage: Adults: One or two 5 ml doses three or four times daily.

Children: Up to one 5 ml dose three or four times daily according to age.

Contra-indications, warnings, etc Precautions:

1. Davenol may cause drowsiness although this is unlikely at the recommended dose. Patients should be cautioned not to drive or operate machinery until it is established that they are not affected in this way.

2. Davenol linctus should not be administered during pregnancy or lactation unless in the judgement of the physician such administration is clinically justifiable. Special care should be taken in the first three months of pregnancy.

3. In common with all products containing sympathomimetic agents, Davenol should be used with caution in patients being treated for asthma.

Treatment of overdose: Not reported. Treatment should be symptomatic.

Pharmaceutical precautions Where necessary disperse Davenol Linctus into suitable, well-closed glass bottles. When required Davenol Linctus may be diluted with Syrup BP. It should not be diluted with water.

Legal category P.

Package quantities Polythene Bottles of 100 ml and 500 ml.

Further information Nil.

Product licence number 0011/5016.

EQUAGESIC

Presentation Equagesic Tablets are three layer, flat bevel-edged tablets, 12.0 mm in diameter. A white layer is sandwiched between a yellow layer and a pink layer. The yellow face is marked WYETH and the pink face is plain. Each tablet contains:

Ethoheptazine citrate	75 mg
Meprobamate BP	150 mg
Aspirin BP	250 mg

Uses Equagesic is an analgesic with muscle-relaxant properties indicated for short-term symptomatic treatment of pain occurring in musculo-skeletal disorders and tension headache.

Dosage and administration Route of administration: Oral.

Dosage - Adults: 2 tablets three or four times daily as needed for the relief of pain.

Elderly: The elderly may respond to lower doses and half the normal adult dose or less may be sufficient.

Children: Not recommended for children.

Contra-indications, warnings, etc

Contra-indications:

1. Equagesic should not be used in patients known to be hypersensitive to the active ingredients or to compounds related to meprobamate such as carisoprodol or carbromal.

2. Meprobamate should not be used in patients with a known propensity for dependence on drugs including alcohol and in patients susceptible to attacks of acute intermittent porphyria.

3. Aspirin should not be used in patients with active peptic ulceration, haemophilia or in renal disease.

Precautions and warnings: Equagesic tablets should not be administered during pregnancy or lactation unless in the judgement of the physician such administration is clinically justifiable. Special care should be taken in the first three months of pregnancy.

2. This product may cause drowsiness. Patients receiving this medication should not drive or operate machinery unless the drug has been shown not to interfere with physical or mental ability.

3. Meprobamate may increase the effects of concurrently administered central nervous system depressants including alcohol.

4. The concurrent use of CNS depressant drugs should be avoided in hepatic insufficiency.

5. Meprobamate may induce seizures in epileptic patients. Convulsions have been seen after abrupt withdrawal of high doses of meprobamate after long term use.

6. Some degree of dependence may occasionally occur with meprobamate in certain cases if dosage recommendations are exceeded with withdrawal symptoms on sudden discontinuation. This is more likely in individuals with emotionally unstable personalities if the drug is taken over long periods, or in others liable to alcohol or other drug dependence. Treatment in these cases should be withdrawn gradually.

Equagesic is recommended for use for short periods only and therefore the risk of dependence occurring with this product is very small.

Aspirin: 7. (a) Aspirin may prolong labour and contribute to maternal and neonatal bleeding and is best avoided at term. It may precipitate bronchospasm and may induce attacks of asthma in susceptible subjects. Aspirin should

only be used with great caution in patients with a history of peptic ulceration.

(b) Concomitant administration with certain other medications such as coumarin anticoagulants, corticosteroids or oral hypoglycaemics may require adjustment of dosage of the various drugs. The action of uricosuric agents may be inhibited.

Overdosage: Meprobamate. Acute poisoning with meprobamate produces coma, shock, vasomotor and respiratory collapse. Very few suicide attempts have proved successful and documented fatal doses have ranged from 12 gm to 47.6 gm. Recovery has occurred after ingestion of similar large amounts (20–40 gm). Gastric lavage is only effective within a short period of drug ingestion as meprobamate is rapidly absorbed from the gastrointestinal tract. Blood concentrations may be reduced by a regime of forced alkaline diuresis or haemodialysis. The respiration may require assistance.

Individual response in overdosage with meprobamate is variable but in some cases the symptoms may be severe. It is therefore, advisable that caution should be observed in prescribing drugs, which contain meprobamate, to patients with depression or to others who may be liable to suicidal ideation or intent.

Aspirin: Overdosage with aspirin will result in the appearance of the signs and symptoms of salicylism. Treatment of aspirin poisoning is largely symptomatic and directed towards correction of the acid-base balance and electrolyte balance of the plasma.

Side-effects: Drowsiness, dizziness and nausea may be experienced with Equagesic but these symptoms usually disappear as treatment continues.

Hypersensitivity reactions may occur rarely both to meprobamate and to aspirin. With meprobamate these reactions include skin rashes and may arise after one to four doses. They may be generalised or local and include urticaria, itchy maculopapular rashes or erythema. Severe systemic reactions with shaking chills and fever, nausea and vomiting, hypotension and collapse have occurred very occasionally and may resemble an anaphylactic shock reaction. There have been a few reports of acute nonthrombocytopenic purpura.

Hypersensitivity reactions to aspirin may manifest themselves as asthma, skin reactions and shock. Aspirin may induce gastro-intestinal haemorrhage, which is occasionally severe but in most cases blood loss is not significant.

Pharmaceutical precautions Store in a cool dry place. Keep tightly closed. Where necessary dispense Equagesic Tablets into suitable well-closed glass bottles.

Legal category POM.

Package quantities Bottles of 100.

Further information Safety and efficacy have not been established beyond short-term use.

Product licence number 0011/5009.

MICROVAL* ▼

Presentation Microval tablets are round white lustrous coated, convex tablets 5.0 mm in diameter. Each tablet contains 30 mcg levonorgestrel.

Uses Oral contraception. Microval is particularly indicated for the older woman changing from combined oral

contraceptives and for women for whom oestrogen treatment is considered unsuitable.

Dosage and administration The tablets are started on the first day of menstruation and taken daily without interruption for as long as contraception is desired. The should be taken at the same time each day, preferably after the evening meal or at bedtime so that the interval between tablets is always about 24 hours. Protection may be reduced when the interval increases beyond 24 hours.

During the first cycle additional contraceptive precautions should be taken for the first 14 days.

If a tablet is not taken at the usual time it should be taken as soon as possible and the next tablet taken at the usual time. If the interval between tablets is more than 27 hours protection may be impaired. The patient should take one tablet as soon as she remembers and thereafter one tablet daily as before but should use additional contraceptive measures until the tablets have been taken regularly for 14 days. If a tablet is missed, the patient should take 1 tablet daily as before but should use additional contraceptive measures until the tablets have been taken regularly for 14 days.

If vomiting occurs shortly after a tablet has been taken contraceptive protection can be maintained by taking another tablet, provided that it is taken within three hours of the normal time. The last tablet in the pack may be used for this purpose. If repeated vomiting or diarrhoea endanger absorption additional contraceptive precautions should be used for 14 days after the symptoms have disappeared.

Irregular spotting or bleeding may occur with a proportion of women initially but menstrual regularity is usually re-established after the first few cycles. Those patients whose menstrual patterns do not become reasonably regular after three to four cycles or who have prolonged bleeding or amenorrhoea lasting for two months should be instructed to return for advice.

Women who change from a combined oral contraceptive to Microval should stop taking the previous product leave seven clear days and take the first Microval tablet on the eighth day, then continue to take 1 tablet daily. Additional contraceptive precautions should be taken until the fourteenth tablet has been taken.

Microval does not diminish the yield of breast milk and can be used from the seventh post-partum day.

Contra-indications, warnings, etc

Contra-indications: Microval should not be given –

1. To patients with established hepatic disease or to those in whom there is evidence of persistently abnormal liver function such as the Dubin-Johnson and Rotor syndromes, or to those who have idiopathic recurrent jaundice of pregnancy.

2. To patients with a history of infectious hepatitis until the liver function tests have returned to normal values.

3. To patients with abnormal vaginal bleeding of unknown aetiology.

4. To patients with suspected pregnancy.

5. Although the risk of thromboembolism has not been associated with progestogen-only contraceptives it is at present required that a history of thromboembolic disorders should be regarded as a contra-indication.

Precautions:

1. Oral contraceptive medication should be discontinued if there is a gradual or sudden, partial or complete

loss of vision, proptosis or diplopia, papilloedema or any evidence of retinal or vascular lesions.

2. Caution should be observed in prescribing oral contraceptives for any patients with a history of migraine, or if migraine is being treated with vasoconstrictor drugs. If migraine worsens or migraine or severe headache develops for the first time during treatment, medication should be discontinued immediately.

3. A small fraction of the progestogen has been identified in the milk of mothers receiving the drug. The long-range effects to the nursing infant is currently unknown.

4. Examination of the pelvic organs, breasts and blood pressure should precede prescription of Microval and should be repeated regularly.

5. Ectopic pregnancies appear to occur more frequently on progestogen-only oral contraceptives.

Side-effects: Microval is well tolerated but certain endocrine effects which are also characteristic of ovulatory cycles may occur. Those noted are headache, light weight gain, nausea, breast tenderness and spotting between periods. The incidence of such effects with Microval is low and tends to decrease as treatment continues.

Drug interactions: Caution should be observed in prescribing oral contraceptives for patients taking other drugs since various interactions have been reported. Pregnancies have been reported in women taking oral contraceptives concurrently with rifampicin and other anti-biotics, anti-epileptic drugs, barbiturates and other edative drugs.

Steroids affect drug metabolism and the therapeutic or toxic effects of other drugs may be modified. Interactions have been reported between oral contraceptives and tricyclic antidepressants, anticoagulants and corticosteroids.

Overdosage: No reports of serious ill-effects from overdosage with oral contraceptives have been reported. In general, therefore, treatment of overdosage is not necessary. If overdosage is, however, discovered within two or three hours and is so large that treatment seems desirable, gastric lavage or a suitable dose of ipecacuanha can be used. There are no specific antidotes and further treatment should be symptomatic.

Pharmaceutical precautions Store at or below room temperature.

Legal category POM.

Package quantities Microval tablets are supplied in blister packs of 35 tablets.

Further information Estimates from clinical trials show that, if the tablets are taken correctly, out of 100 women taking them for one year, on average one woman may become pregnant during that year. Microval although not quite as effective as combined oral contraceptives, provides an extremely high degree of protection and is very much more effective than withdrawal, rhythm, rhythm method or chemicals and comparable to the I.U.C.D. and diaphragm.

Levonorgestral is a totally synthetic progestogen which possesses no inherent oestrogenicity. It has anti-oestrogenic properties and has minimal effects on metabolic functions.

Product licence number 0011/0040.

MUCAINE*

Presentation Mucaine Suspension is a white suspension with the odour and flavour of peppermint. Each 5 ml contains:

Oxethazaine	10 mg
Magnesium Hydroxide BPC	100 mg
Aluminium Hydroxide Mixture BP	4.75 ml

Uses Mucaine is an antacid mixture containing a topical anaesthetic and is indicated for oesophagitis whatever its cause, including peptic oesophagitis with or without hiatus hernia, radiation oesophagitis and the heartburn of late pregnancy.

The relief obtained in the symptomatic treatment of oesophagitis is due to the surface anaesthetic, oxethazaine, aided by the physical and antacid properties of the vehicle. Oxethazaine is stable at the levels of acidity or alkalinity found in the upper gastrointestinal tract and has relatively prolonged action.

Dosage and administration Route of administration: Oral.

Dosage - Adults: One to two 5 ml doses should be taken three or four times daily, 15 minutes before meals, and at bedtime, or as required. The dose should not be washed down with a drink.

Children: Not recommended for children.

Contra-indications, warnings, etc

Contra-indications: The aluminium ion combines with phosphate to form an insoluble complex which is not absorbed. When high doses are given together with a low phosphorus diet, phosphate depletion occurs, although phosphate depletion does not occur in patients on a normal diet. Mucaine is contra-indicated in patients with hypophosphataemia.

Side-effects: Mucaine is well tolerated and the side-effects which have been reported are almost invariably mild and transient in nature, consisting principally of dryness of the mouth, soreness of the tongue or nausea.

Precautions:

1. Magnesium and aluminium hydroxides may form complexes with tetracyclines and reduce the absorption when given concomitantly.

2. Aluminium hydroxide may reduce absorption of digoxin.

3. Mucaine suspension should not be given during the first three months of pregnancy or lactation unless in the judgement of the physician such administration is clinically justifiable.

Action in case of overdosage: Not reported. Treatment should be symptomatic.

Pharmaceutical precautions Store in a cool place. Where necessary dispense Mucaine Suspension into suitable well-closed glass or polythene bottles. When required Mucaine Suspension may be diluted with Syrup BP.

Legal category POM.

Package quantities Polythene bottles of 500 ml.

Further information It is important to stress that Mucaine should not be washed down with a drink because maximal relief depends on good contact between the inflamed mucosal surface and the suspension as it passes down the oesophagus.

Product licence number 0011/5014.

NORMISON®

Presentation Normison capsules are opaque yellow, oval, soft gelatin capsules containing 10 mg or 20 mg temazepam. The 10 mg capsules are No. 4 capsules printed with WYETH in black lettering. The 20 mg capsules are No. 7.5 oval soft gelatin capsules printed WYETH on one side and 20 on the other in red lettering.

Uses Normison is indicated for the treatment of insomnia, and for premedication before minor surgery or other procedures especially when hospital admission is not essential.

Dosage and administration Route of administration: Oral.

Adults: Insomnia: Dosage: 10–30 mg half an hour before retiring. The dose may be increased to 40 or 60 mg in patients who do not respond to the lower dose because of severe or persistent insomnia.

Premedication:

Dosage: 20–40 mg, 30–60 minutes before surgical or other procedures.

Children: Normison has not been evaluated for the treatment of children.

Contra-indications, warnings, etc

Contra-indications: Normison should not be given to patients with a previous history of sensitivity to benzodiazepines.

Precautions:

1. Concomitant administration with central nervous system depressants, including alcohol, general anaesthetics, narcotic analgesics, monoamine oxidase inhibitors and antidepressants will result in an accentuation of their effects.

2. Prolonged or excessive use of benzodiazepines may occasionally result in the development of some psychological dependence with withdrawal symptoms on sudden discontinuation. Treatment in these cases should be withdrawn gradually. Careful usage seldom results in the development of dependence.

3. When used as a hypnotic, daytime drowsiness is unlikely to be a problem with Normison since the short half-life usually ensures that the effects disappear by the morning. As with other drugs acting on the central nervous system, however, patients should be cautioned against driving or operating machinery until it is established that they do not become dizzy or drowsy while taking Normison.

4. Normison capsules should not be administered during pregnancy or lactation unless in the judgement of the physician such administration is clinically justifiable. Special care should be taken in the first three months of pregnancy.

5. Elderly patients or those suffering from cerebral vascular changes such as arteriosclerosis are likely to respond to smaller doses.

6. After medication with Normison before surgical or other procedures, patients should be accompanied home.

Side-effects: Because of its short half-life, the effects of temazepam are usually restricted to the night of ingestion. Drowsiness or dizziness on waking is rare. Morning headaches, transient rashes and mild gastro-intestinal disturbances have occasionally been reported.

Overdosage: As with other benzodiazepines, overdoses should not present a threat to life. General supportive measures should be used. Treatment is

symptomatic and gastric lavage may be of use performed shortly after ingestion. If the patient conscious, an emetic such as ipecacuanha may be given. The patient is likely to sleep and a clear airway should be maintained.

Pharmaceutical precautions Store in a cool, dry place. When necessary dispense Normison capsules in suitable well-closed glass bottles.

Legal category POM.

Package quantities 10 mg: bottles of 100, 500 and 1,000.

20 mg: bottles of 100 and 500.

Further information Normison is a short acting benzodiazepine. It is rapidly absorbed from the liquid filled soft gelatin capsules and peak plasma levels are usually reached in 20 to 40 minutes. Normison has plasma half life of less than six hours, Normison is metabolised by a simple one-step process to a pharmacologically inert glucuronide. There are no major active metabolites and virtually no risk of accumulation. Clinical studies have shown minimal effects on REM sleep patterns and on psychomotor performance on the day after treatment with Normison.

10 mg capsules 0011/0060

20 mg capsules 0011/0063

OVRAN®**OVRAN 30®****OVRANETTE®**

Presentation Ovrin tablets are round, white, convex tablets, 6.5 mm in diameter, both faces marked WYETH. Each tablet contains 250 mcg levonorgestrel (d-norgestrel) and 50 mcg Ethinylloestradiol BP.

Ovrin 30 tablets are round, white, convex tablets 6.5 mm in diameter, one face marked WYETH and the other plain. Each tablet contains 250 mcg levonorgestrel (d-norgestrel) and 30 mcg Ethinylloestradiol BP.

Ovrinette tablets are round, white, convex tablets 6.5 mm in diameter, one face marked WYETH and the other face marked '30'. Each tablet contains 150 mcg levonorgestrel (d-norgestrel) and 30 mcg Ethinylloestradiol BP.

Uses Oral contraception. Treatment of endometriosis, spasmodic dysmenorrhoea, pre-menstrual tension, oligomenorrhoea. Treatment of abnormal uterine bleeding such as menorrhagia, metropathia haemorrhagica. Emergency treatment of acute uterine bleeding.

Dosage and administration **Contraception:** For the first course of medication the tablets are started on the fifth day of the cycle, counting the first day of menstruation as day one. One tablet is taken at the same time each day for 21 days followed by seven days without medication. On the eighth day the tablets are started again. Additional contraceptive precautions should be taken until the fourteenth tablet of the first cycle has been taken. In subsequent cycles the protection cover every day of the cycle, provided that the tablets are taken correctly. During the seven clear days, withdrawal bleeding should occur. If a cycle with amenorrhoea occurs the patient should seek medical advice.

Women who change from another oral contraceptive to Ovrin, Ovrin 30 or Ovrinette should stop taking the

previous product, at the end of the pack leave seven clear days and take the first Ovran, Ovran 30 or Ovranette tablet on the eighth day, then continue to take 1 tablet daily for 21 days. Additional contraceptive precautions should be taken until the fourteenth tablet of the first cycle has been taken.

Occasionally spotting or bleeding may occur in some women initially, but menstrual regularity is usually re-established after the first few cycles. If medication is discontinued because of severe breakthrough bleeding new course should be started on the fifth day from the start of bleeding. Additional contraceptive precautions should be taken until the fourteenth tablet of the new course has been taken.

If a tablet is forgotten the woman should take two on the following day at the usual time. If more than one tablet is missed, tablet taking should be resumed when remembered with the tablet appropriate for that day and additional precautions should be taken until the next withdrawal bleed. Withdrawal bleeding may occur as a result of missed tablets, but the patient should continue to take the tablets as directed.

Treatment with Ovran, Ovran 30 or Ovranette should be withdrawn six weeks before elective surgery or treatment of varicose veins by injection of sclerosant.

After childbirth oral contraception is usually started as soon as spontaneous menstruation has been resumed. No other method of contraception should be used in the interval between delivery and the first course, unless it started within seven days of delivery.

Oral contraception may be started on the fifth day after an abortion or miscarriage.

If vomiting or diarrhoea impair absorption additional contraceptive precautions should be taken until the next withdrawal bleed.

Other indications: Ovran and Ovranette can be used for the indications listed below, but Ovran usually provides the more convenient dosage unit.

Endometriosis: Treatment should be continuous with 1 Ovran tablet daily. If spotting or breakthrough bleeding occurs it may be necessary to give 2 tablets daily or orally 3 tablets daily.

Spasmodic dysmenorrhoea, premenstrual tensions, ligamentorrhoea: Dosage as for oral contraception.

Postponement of menstruation: If postponement of a withdrawal bleed is considered desirable, the women should continue taking the tablets for the period during which delay is required. A seven-day gap should then be left before starting a new pack. If spotting or breakthrough bleeding occurs dosage should be increased to 2 tablets daily.

Functional uterine bleeding: When the diagnosis has been established dosage is similar to the dosage for oral contraception, but in the first one or two cycles it may be necessary to give 2 Ovran tablets (or in exceptional cases, 3) daily in order to control the regularity of the cycle.

Emergency treatment of the acute uterine bleeding: 2 Ovran tablets are given immediately. If bleeding continues medication is continued at a dose of 4 tablets daily. This can usually be reduced to 2 tablets within two to four days. Treatment should continue for 10 days and after this time it can either be discontinued to be followed after seven days by a complete course of 1 tablet daily for 21 days (see 'Functional uterine bleeding') or it can be continued for one to three months to inhibit the menses (see 'Postponement of menstruation'). In the

latter case it should be possible to reduce the dosage to 1 tablet daily.

Contra-indications, warnings, etc

Contra-indications: Ovran, Ovran 30 and Ovranette, like other progestogen-oestrogen combinations, should not be given:

1. To patients with established hepatic disease or to those in whom there is evidence of persistently abnormal liver function such as the Dubin-Johnson and Rotor syndromes, or to those who have idiopathic recurrent jaundice of pregnancy.
2. To patients with a history or suspicion of carcinoma of the reproductive organs or breasts.
3. To patients with a history or evidence suggestive of thromboembolic or cerebrovascular disease or phlebitis.
4. To patients with cardiovascular disease.
5. To patients with a history of infectious hepatitis until the liver function tests have returned to normal values.
6. To patients with abnormal, vaginal bleeding of unknown aetiology.
7. To patients with known or suspected oestrogen-dependent neoplasia.
8. To patients with suspected pregnancy.
9. To patients with sickle cell anaemia.
10. To patients with deterioration of otosclerosis during pregnancy.
11. To patients with a history of herpes gestationis.

Precautions:

1. Under the influence of oestrogen-progestogen preparations, pre-existing uterine fibromyomata may increase in size.
2. Oestrogen-progestogen preparations may cause some degree of fluid retention. Conditions which might be influenced by this factor, such as epilepsy, migraine, asthma, cardiac or renal dysfunction, require careful observation.
3. Patients with a history of psychic depression should be carefully observed and the drug discontinued if the depression recurs to a serious degree.
4. A decrease in glucose tolerance has been observed in a significant percentage of patients on oral contraceptives. Diabetic patients should be carefully observed while receiving therapy.
5. Susceptible women may experience an increase in blood pressure following administration of contraceptive steroids. Caution should therefore be exercised in prescribing oral contraceptives for women with a history of hypertension.
6. Oral contraceptive medication should be discontinued if there is a gradual or sudden, partial or complete loss of vision, proptosis or diplopia, papilloedema or any evidence of retinal or vascular lesions.
7. Caution should be observed in prescribing oral contraceptives for any patient with a history of migraine, or if migraine is being treated with vasoconstrictor drugs. If migraine worsens or migraine or severe headache develops for the first time during treatment, medication should be discontinued immediately.
8. A small fraction of the hormonal agents in oral contraceptives has been identified in the milk of mothers receiving these drugs. The long-range effect to the nursing infant is currently unknown.
9. Hepatic lesions (adenomas, hepatomas, hamartomas, regenerating nodules, etc.), occasionally fatal, have been reported in women taking oral contraceptives. Such lesions may present as an abdominal mass or with

the signs and symptoms of an acute abdomen. These lesions should be considered if the patient has abdominal pain or evidence of intra-abdominal bleeding. Such lesions have been reported in short-term as well as long-term users of oral contraceptives.

10. In breakthrough bleeding or irregular vaginal bleeding, non-functional causes should be borne in mind.

11. The risk of arterial thrombosis associated with combined oral contraceptives increases with age, and this risk is aggravated by cigarette smoking. The use of combined oral contraceptives by women in the older age group, especially those who are cigarette smokers, should therefore be discouraged and alternative methods advised.

12. Examination of the pelvic organs, breasts and blood pressure should precede prescription of an oral contraceptive and should be repeated regularly.

13. Certain conditions require careful observation during treatment with oral contraceptives. These are: a history of depression, varicose veins, diabetes, hypertension, epilepsy, otosclerosis, multiple sclerosis, porphyria, tetany, disturbed liver function, gall-stones, renal diseases, chloasma, uterine fibroids, asthma, the wearing of contact lenses or any condition prone to worsen during pregnancy.

Side-effects: Oral contraceptives produce certain endocrine effects characteristic of ovarian oestrogens and progesterone. The hormones secreted during an ovulatory cycle may produce similar effects including headache, slight weight gain, nausea, breast tenderness, changed libido, depressive moods, and spotting between periods. The overall incidence of such effects with Ovran, Ovran 30 and Ovranette is low and tends to decrease as treatment cycles continue. Cycle control is good and spotting and breakthrough bleeding occur only rarely. Extensive studies on considerable numbers of women taking oral contraceptives indicate some increased risks over non-pregnant women who are not taking oral contraceptives. These include thromboembolism, impaired glucose tolerance and even more rarely, liver dysfunction, hypertension and raised serum lipids.

Drug interactions: Caution should be observed in prescribing oral contraceptives for patients taking other drugs since various interactions have been reported. Pregnancies have been reported in women taking oral contraceptives concurrently with rifampicin and other antibiotics, anti-epileptic drugs, barbiturates and other sedative drugs.

Steroids affect drug metabolism and the therapeutic or toxic effects of other drugs may be modified. Interactions have been reported between oral contraceptives and tricyclic anti-depressants, anticoagulants and corticosteroids.

Overdosage: No reports of serious ill-effects from overdosage with combined oral contraceptives have been reported. In general, therefore, treatment of overdosage is not necessary. If overdosage is, however, discovered within two or three hours and is so large that treatment seems desirable, gastric lavage or a suitable dose of ipecacuanha can be used. There are no specific antidotes and further treatment should be symptomatic.

Pharmaceutical precautions Store at, or below, room temperature.

Legal category POM.

Package quantities Ovran, Ovran 30, and Ovranette are supplied in memo packs of 21 tablets.

Further information Levonorgestrel is a totally synthetic progestogen which possesses no inherent oestrogenicity. It has anti-oestrogenic properties and has minimal effects on metabolic functions.

Pearls Index: Ovran, 0.19. Ovran 30, 0.13. Ovranette 0.35.

PENIDURAL* (ORAL)

Presentation Penidural Oral Suspension is a smooth pink suspension with a sweet cherry flavour. Each 5 ml dose contains: 229 mg Benzathine Penicillin BP (equivalent to 300,000 units Penicillin G).

Penidural Oral Drops is a smooth pink suspension with a sweet cherry flavour. Each 1 ml contains 115 mg Benzathine Penicillin BP (equivalent to 150,000 units Penicillin G).

Uses Penidural Oral presentations are indicated for the treatment of mild to moderately severe penicillin-sensitive infections and prophylaxis of penicillin-sensitive secondary infections especially in children.

Dosage and administration Route of administration Oral.

Dosage: Benzathine penicillin is a repository penicillin which gives effective blood levels for a long period, six to eight-hourly dosage being adequate in most patients.
Penidural oral suspension: Adults: Two 5 ml doses three to four times daily.

Children: One 5 ml dose three to four times daily.

Penidural oral drops: Adults: Not recommended.

Children: 1 dropful (0.1 mega units) four to six times daily according to age.

Contra-indications, warnings, etc

Contra-indications: Benzathine penicillin is contra-indicated in patients with a previous history of penicillin hypersensitivity and in small babies whose mothers have such a history.

Precautions and warnings: 1. Prolonged use of an anti-infective may result in the development of super infection due to organisms resistant to that anti-infective.

2. Penidural oral suspension should not be administered during pregnancy or lactation unless in the judgement of the physician such administration is clinically justifiable. Special care should be taken in the first three months of pregnancy.

Side-effects: Penicillin may cause an acute anaphylactic reaction which can be fatal. This reaction appears to occur more frequently in patients with bronchial asthma or other allergic disorders. Reactions have been reported after the use of all forms of penicillin by all routes of administration but are less likely after oral penicillin because of slower absorption.

Penidural is otherwise virtually free from side-effect: apart from occasional loose stools or borborygmi.

Pharmaceutical precautions *Penidural Oral Suspension:* Store in a cool place. Where necessary dispense Penidural Oral Suspension into suitable well-closed

glass bottles. When required Penidural Oral Suspension may be diluted with Syrup BP.

Penidural Oral Drops: Store in a cool place.

Legal category POM.

Package quantities Penidural Oral Suspension: Bottles of 100 ml.

Penidural Oral Drops: Bottles of 10 ml.

Further information Nil.

rops 0011/5018

ERENID-D*

ERENID*-FORTE

Presentation Serenid-D Tablets are presented as tablets containing 10 mg or 15 mg oxazepam.

Serenid-D 10 mg tablets are white flat bevel edged tablets 6.5 mm in diameter, marked WYETH on one face and 10 on the other.

Serenid-D 15 mg tablets are white, flat, bevel edged tablets, 8.0 mm in diameter, marked 15 on one face and WYETH on the other.

Serenid Forte is presented as red/green No. 4 hard gelatin capsules printed with the word WYETH, containing 30 mg oxazepam.

Uses Serenid-D and Serenid Forte are indicated in the control and management of all degrees of anxiety, tension, irritability and related symptoms. Anxiety associated with depression. Phobic states. Other neurotic reactions, e.g. obsessive-compulsive reactions where the underlying factor is intense anxiety. Anxiety in psychotic patients, in whom it may allow reduced dosage of neuroleptic drugs. Anxiety associated with organic disorders. Alcoholism, in combination with other agents in the management of the acute stages.

Dosage and administration Route of administration: oral.

Dosage – Serenid Forte:

Adults: Severe anxiety – 1–2 capsules three times daily. Less severe anxiety – 1 capsule three times daily and at night. Patients with severe sleep disturbance can be given 2 capsules at night.

Children: Serenid Forte has not been evaluated for the treatment of children.

Dosage – Serenid-D:

Adults: Mild to moderate anxiety – one or two 15 mg tablets three (or four) times daily.

Geriatric patients or those who are particularly sensitive to the effects of benzodiazepines – 10–20 mg three or four times daily.

Children: Serenid-D has not been evaluated for the treatment of children.

Contra-indications, warnings, etc

Contra-indications: Oxazepam should not be given to patients with a previous history of sensitivity to benzodiazepines.

Precautions and warnings:

1. Concomitant administration with central nervous system depressants, including alcohol, general anaesthetics, narcotic analgesics, monoamine oxidase inhibitors

and antidepressants will result in an accentuation of their effects.

2. Prolonged or excessive use of benzodiazepines may occasionally result in the development of some psychological dependence with withdrawal symptoms on sudden discontinuation. Treatment in these cases should be withdrawn gradually. Careful usage seldom results in the development of dependence.

3. As with other drugs acting on the central nervous system, patients should be cautioned against driving or operating machinery until it is established that they do not become dizzy or drowsy while taking oxazepam.

4. Serenid-D and Serenid Forte should not be administered during pregnancy or lactation unless in the judgement of the physician such administration is clinically justifiable. Special care should be taken in the first three months of pregnancy.

5. The use of anxiolytic drugs may uncover covert suicidal tendencies, in patients with a psychological depressive component of the illness.

6. Serenid-D and Serenid Forte should not be used in labour unless considered essential. High single doses or repeated low doses of other benzodiazepines have been reported to produce hypotonia, poor sucking and hypotension in the neonate and irregularities in the foetal heart.

Side-effects: Transient mild drowsiness is commonly seen in the first few days of therapy. If it becomes troublesome dosage should be reduced. In a few cases dizziness, vertigo, headache and, rarely, syncope have occurred either alone or with drowsiness. Mild excitatory effects with stimulation of affect have sometimes been reported in psychiatric patients; these reactions may be secondary to relief of anxiety and usually appear in the first two weeks of therapy.

Other side effects include rare cases of minor diffuse skin rashes (morbilliform, urticarial and maculopapular), nausea, lethargy, oedema, slurred speech, tremor and altered libido. Such effects have been infrequent and are generally controlled with reduction of dosage.

Overdosage: A few cases of attempted suicide with oxazepam have been reported, but none has been successful with oxazepam alone. Records show that up to 540 mg have been taken without long-term ill-effects.

As with other benzodiazepines, overdosages should not present a threat to life. General supportive measures should be used. Treatment is symptomatic and gastric lavage may be of use if performed shortly after ingestion. If the patient is conscious, an emetic such as ipecacuanha may be given. The patient is likely to sleep and a clear airway should be maintained.

Pharmaceutical precautions Store in a cool, dry place.

Legal category POM.

Package quantities *Serenid-D 10 mg and 15 mg. Tablets:* Packs of 100.

Serenid Forte Capsules: Bottles of 100.

Further information Serenid-D and Serenid Forte is particularly suitable for elderly patients because of its short half-life and lack of accumulation.

Serenid-D and Serenid Forte is a short-acting benzodiazepine. It is metabolised by a simple one-step process to a pharmacologically inert glucuronide. There are no major metabolites. The elimination half-life is 6–8 hours and there is minimal risk of excessive accumulation.

Serenid-D 15 mg 0011/5023

Serenid Forte 0011/5024

SPARINE* (ORAL)

Presentation Sparine is presented as tablets containing 25 mg, 50 mg or 100 mg Promazine Hydrochloride BP per tablet and as an oral suspension. Each 5 ml suspension contains promazine embonate equivalent to 50 mg Promazine Hydrochloride BP.

Sparine Tablets 25 mg: Yellow, sugar-coated tablets, 7.5 mm in diameter.

Sparine Tablets 50 mg: Orange, sugar-coated tablets, 10 mm in diameter.

Sparine Tablets 100 mg: Red, sugar-coated tablets, 11 mm in diameter.

Sparine Suspension: Yellow suspension with an odour and taste of pineapple.

Uses Sparine is indicated for: Control of agitation, e.g. in the elderly, in ambulant and outpatient psychotics, agitated mental defectives, etc. Alleviation of nausea and vomiting. Potentiation of analgesics, e.g. in terminal carcinoma.

Dosage and administration Route of administration: Oral.

Dosage - Adults: Sparine Tablets - 25-100 mg three or four times daily. In frail subjects 25 mg initially.

Sparine Suspension - One 5 ml dose three times daily: increase if necessary.

Children: Sparine Tablets and Suspension - dose proportional to dose for 70 kg adult.

Contra-indications, warnings, etc

Contra-indications: Use in patients hypersensitive to the active ingredient.

Precautions and warnings:

1. Phenothiazines should only be used with great caution in patients with a history of jaundice or with existent liver dysfunction or blood dyscrasias, coronary insufficiency or cardiac disease.

2. The concomitant administration of this product with other medication such as central nervous system depressants (including alcohol and anaesthetics) or antihypertensives or anticholinergics will result in accentuation of their effects, while potentiation of action will also occur with monoamine oxidase inhibitors, antidepressants and analgesics.

3. Sparine Tablets and Suspension should not be administered during pregnancy or lactation unless in the judgement of the physician such administration is clinically justifiable. Special care should be taken in the first three months of pregnancy.

4. Patients receiving phenothiazines over a prolonged period require regular and careful surveillance with particular attention to potential for inducing eye changes, effects on haemopoiesis, liver dysfunction, myocardial conduction effects, particularly if other concurrently administered drugs also have potential effects on these systems.

5. Phenothiazines may induce drowsiness. Persons taking these drugs should not drive or operate machinery unless the drug has been shown not to interfere with physical or mental ability.

6. Use of phenothiazines at high (relative or absolute)

doses may induce extrapyramidal side-effects, dyskinesia, akathisia, dystonia. These are likely to be particularly severe in children.

7. Prolonged administration of phenothiazines may result in persistent or tardive dyskinesias particularly in the elderly.

8. Care should be exercised if Sparine is used for the treatment of patients with cerebral arteriosclerosis, coronary heart disease or other conditions in which a fall in blood pressure might be undesirable.

9. Sparine Suspension is formulated with aluminium hydroxide which may complex tetracyclines if given concomitantly.

Treatment of overdosage: Ingestion of large amounts of promazine is followed by deep sleep, with or without pronounced fall in blood pressure and without particular change in respiration rate, other than the slow attendant upon sedation. Occasionally an initial period of excitement may precede coma, followed by grand mal seizures.

In the absence of any specific antidote, treatment should be based on ordinary therapeutic principles with special emphasis on the following measures: (a) gastric lavage; (b) treat convulsions if present; (c) correction of acute hypotension if necessary; (d) counteraction of the effects of an excess of promazine hydrochloride on the central nervous system; (e) control and natural recovery of excessive hypothermia.

Side-effects: Sparine is a member of the phenothiazine group of drugs and the side-effects associated with the group have been noted, e.g. drowsiness, transient postural hypotension, allergic skin conditions and agranulocytosis. The incidence of these effects is considerably lower than with other drugs of this group.

Pharmaceutical precautions Store Sparine Suspension in a cool place and protect from light. When required Sparine Suspension may be diluted with Syrup BP.

Legal category POM.

Package quantities *Sparine Tablets 25 mg and 50 mg:* Bottles of 250.

Sparine Tablets 100 mg: Bottles of 50 and 250.

Sparine Suspension: Bottles of 150 ml and 1 litre.

Sparine Tablets: 100 mg 0011/5057

Sparine Suspension: 0011/5045

SPARINE* (PARENTERAL)

Presentation Sparine injection is a clear, colourless aqueous solution containing 50 mg Promazine Hydrochloride BP per millilitre.

Uses Sparine injection is indicated for: senile agitation and confusion, pre-delivery sedation, severe pain, nausea and vomiting, hiccup, secondary anxiety, pain and sickness in the elderly, acute or severe agitation or mania, chronic psychoses and psychoneuroses, premedication before ECT, acute alcoholism, treatment of drug withdrawal symptoms, hyperemesis gravidarum, severe vomiting during or after labour, sedation prior to operative or diagnostic procedures under local or regional anaesthesia, radiation sickness, examination and management

of cases of head injury, tetanus, chorea, priapism, toxic psychosis.

Dosage and administration Route of administration: Parenteral.

Dosage: Adults: 50 mg Sparine intramuscularly. Repeat if necessary after six to eight hours. In frail subjects, 25 mg. In obstetrics, 50 mg Sparine with 50 mg pethidine in the same syringe. The daily dose should not exceed 1 g.

If Sparine is injected intravenously it must be diluted with an equal volume of saline.

Children: 25 mg Sparine intramuscularly. Repeat if necessary after six to eight hours. Otherwise proportional to dose for 70 kg adult.

Contra-indications, warnings, etc

Contra-indications:

1. Use in patients in coma.
2. Use in patients hypersensitive to the active ingredient.

Precautions and warnings:

1. Phenothiazines should only be used with great caution in patients with a history of jaundice or with existent liver dysfunction, or blood dyscrasias, coronary insufficiency or cardiac disease.

2. The concomitant administration of this product with other medication such as central nervous system depressants (including alcohol and anaesthetics) or antihypertensives or anticholinergics will result in accentuation of their effects, while potentiation of action will also occur with monoamine oxidase inhibitors, antidepressants and analgesics.

3. Sparine injection should not be administered during pregnancy or lactation unless in the judgement of the physician such administration is clinically justifiable. Special care should be taken in the first three months of pregnancy.

4. Patients receiving phenothiazines over a prolonged period require regular and careful surveillance with particular attention to potential for inducing eye changes, effects on haemopoiesis, liver dysfunction, myocardial conduction effects, particularly if other concurrently administered drugs also have potential effects on these systems.

5. Phenothiazines may induce drowsiness. Persons taking these drugs should not drive or operate machinery unless the drug has been shown not to interfere with physical or mental ability.

6. Use of phenothiazines at high (relative or absolute) doses may induce extrapyramidal side-effects, dyskinesia, akathisia, dystonia. These are likely to be particularly severe in children.

7. Prolonged administration of phenothiazines may result in persistent or tardive dyskinesias particularly in the elderly.

8. Administration by the intravenous route may induce local vascular spasm or thrombophlebitis. The preparation must be diluted before use. Arteriolar spasm and gangrene have been reported following accidental intra-arterial injection of high concentrations.

9. Care should be exercised if Sparine is used for the treatment of patients with cerebral arteriosclerosis, coronary heart disease or other conditions in which a fall in blood pressure might be undesirable.

Treatment of overdose: Ingestion of large amounts of promazine is followed by deep sleep, with or without a pronounced fall in blood pressure and without particular

change in respiration rate, other than the slowing attendant upon sedation. Occasionally an initial period of excitement may precede coma, followed by grand mal seizures.

In the absence of any specific antidote, treatment should be based on ordinary therapeutic principles with special emphasis on the following measures: (a) gastric lavage; (b) treat convulsions if present; (c) correction of acute hypotension if necessary; (d) counteraction of the effects of an excess of promazine hydrochloride on the central nervous system; (e) control and natural recovery of hypothermia.

Side-effects: Sparine is a member of the phenothiazine group of drugs and the side-effects associated with that group have been noted, e.g. drowsiness, transient postural hypotension, allergic skin conditions and agranulocytosis. The incidence of these effects is considerably lower than with other drugs of this group.

Pharmaceutical precautions Sparine Injection should not be mixed with other injections with the exception of Pethidine Injection BP.

Legal category POM.

Package quantities Boxes of 10 by 1 ml or 2 ml ampoules.

Further information Nil.

Product licence number 0011/5043.

TRINORDIOL* ▼

Presentation The memo pack holds six light brown tablets, containing 50mcg levonorgestrel and 30 mcg Ethinyloestradiol BP, five white tablets containing 75 mcg levonorgestrel and 40 mcg Ethinyloestradiol BP and ten ochre tablets containing 125 mcg levonorgestrel and 30 mcg Ethinyloestradiol BP.

All tablets are round 5.6 mm in diameter with a lustrous sugar coating.

Uses Oral contraception.

Dosage and administration *Contraception:* For the first course of medication the tablets are started on the first day of the cycle, counting the first day of menstruation as day one. One tablet is taken at the same time each day for 21 days followed by seven days without medication. On the eighth day the tablets are started again. The protection covers every day of the cycle, provided that the tablets are taken correctly. During the seven clear days withdrawal bleeding should occur. If a cycle with amenorrhoea occurs the patient should seek medical advice.

Women who change from another oral contraceptive to Trinordiol should stop taking the previous product at the end of the pack and take the first tablet of Trinordiol on the day after taking the last tablet of their old pack, then continue to take 1 tablet daily for 21 days. If it is preferred to leave a seven-day gap before starting Trinordiol, then additional contraceptive precautions should be taken for the first 14 days of the first cycle.

Occasionally spotting or bleeding may occur in some women initially, but menstrual regularity is usually re-established after the first few cycles. If medication is discontinued because of severe breakthrough bleeding a new course should be started on the fifth day from the start of bleeding. Additional contraceptive precautions should be taken until the fourteenth tablet of the new course has been taken.

If a tablet is forgotten the woman should take two on the following day at the usual time. If more than one tablet is missed, tablet taking should be resumed when remembered with the tablet appropriate for that day and additional precautions should be taken until the next withdrawal bleed. Withdrawal bleeding may occur as a result of missed tablets, but the patient should continue to take the tablets as directed. Treatment with Trinordiol should be withdrawn six weeks before elective surgery or treatment of varicose veins by injection of sclerosant.

After childbirth oral contraception is usually started as soon as spontaneous menstruation has been resumed. Another method of contraception should be used in the interval between delivery and the first course, unless it is started within seven days of delivery.

Oral contraception may be started on the fifth day after an abortion or miscarriage.

If vomiting or diarrhoea impair absorption, additional contraceptive precautions should be taken until the next withdrawal bleed.

Contra-indications, warnings, etc

Contra-indications: Trinordiol like other progestogen-oestrogen combinations, should not be given:

1. To patients with established hepatic disease or to those in whom there is evidence of persistently abnormal liver functions such as Dubin-Johnson and Roter syndromes, or to those who have idiopathic recurrent jaundice of pregnancy.
2. To patients with a history or suspicion of carcinoma of the reproductive organs or breasts.
3. To patients with a history or evidence suggestive of thromboembolic or cerebrovascular disease or phlebitis.
4. To patients with cardiovascular disease.
5. To patients with a history of infectious hepatitis until the liver function tests have returned to normal values.
6. To patients with abnormal vaginal bleeding of unknown aetiology.
7. To patients with known or suspected oestrogen-dependent neoplasia.
8. To patients with suspected pregnancy.
9. To patients with sickle cell anaemia.
10. To patients with deterioration of otosclerosis during pregnancy.
11. To patients with a history of herpes gestationis.

Precautions:

1. Under the influence of oestrogen-progestogen preparations, pre-existing uterine fibromyomata may increase in size.
2. Oestrogen-progestogen preparations may cause some degree of fluid retention. Conditions which might be influenced by this factor, such as epilepsy, migraine, asthma, cardiac or renal dysfunction, require careful observation.
3. Patients with a history of psychic depression should be carefully observed and the drug discontinued if the depression recurs to a serious degree.
4. A decrease in glucose tolerance has been observed in a significant percentage of patients on oral contraceptives. Diabetic patients should be carefully observed while receiving therapy.
5. Susceptible women may experience an increase in blood pressure following administration of contraceptive steroids. Caution should therefore be exercised in prescribing oral contraceptives for women with a history of hypertension.

6. Oral contraceptive medication should be discontinued if there is a gradual or sudden, partial or complete loss of vision, proptosis or diplopia, papilloedema or any evidence of retinal or vascular lesions.

7. Caution should be observed in prescribing oral contraceptives for any patient with a history of migraine, or if migraine is being treated with vasoconstrictor drugs. If migraine worsens or migraine or severe headache develops for the first time during treatment, medication should be discontinued immediately.

8. A small fraction of the hormonal agents in oral contraceptives has been identified in the milk of mothers receiving these drugs. The long-range effect to the nursing infant is currently unknown.

9. Hepatic lesions (adenomas, hepatomas, hamartomas, regenerating nodules, etc), occasionally fatal, have been reported in women taking oral contraceptives. Such lesions may present as an abdominal mass or with the signs and symptoms of an acute abdomen. These lesions should be considered if the patient has abdominal pain or evidence of intra-abdominal bleeding. Such lesions have been reported in short-term as well as long-term users of oral contraceptives.

10. In breakthrough bleeding or irregular vaginal bleeding, non-functional causes should be borne in mind.

11. The risk of arterial thrombosis associated with combined oral contraceptives increases with age, and this risk is aggravated by cigarette smoking. The use of combined oral contraceptives by women in the older age group, especially those who are cigarette smokers, should therefore be discouraged and alternative methods advised.

12. Examination of the pelvic organs, breasts and blood pressure should precede prescription of an oral contraceptive and should be repeated regularly.

13. Certain conditions require careful observation during treatment with oral contraceptives. These are: history of depression, varicose veins, diabetes, hypertension, epilepsy, otosclerosis, multiple sclerosis, porphyria, tetany, disturbed liver function, gall-stones, renal disease, chloasma, uterine fibroids, asthma, the wearing of contact lenses or any condition prone to worsen during pregnancy.

Side-effects: Oral contraceptives produce certain endocrine effects characteristic of ovarian oestrogens and progesterone. The hormones secreted during an ovulatory cycle may produce similar effects including headache, slight weight gain, nausea, breast tenderness, changed libido, depressive moods and spotting between periods. The overall incidence of such effects with Trinordiol is low and tends to decrease as treatment cycles continue. Cycle control is good and spotting and breakthrough bleeding occur only rarely. Extensive studies on considerable numbers of women taking oral contraceptives indicate some increased risks over non-pregnant women who are not taking oral contraceptives. These include thromboembolism, impaired glucose tolerance and even more rarely, liver dysfunction, hypertension and raised serum lipids.

Drug interactions: Caution should be observed in prescribing oral contraceptives for patients taking other drugs since various interactions have been reported. Pregnancies have been reported in women taking oral contraceptives concurrently with rifampicin and other antibiotics, anti-epileptic drugs, barbiturates and other sedative drugs.

Steroids affect drug metabolism and the therapeutic or

toxic effects of other drugs may be modified. Interactions have been reported between oral contraceptives and tricyclic antidepressants, anticoagulants and corticosteroids.

Overdosage: No reports of serious ill-effects from overdosage with combined oral contraceptives have been reported. In general, therefore, treatment of overdosage is not necessary. If overdosage is, however, discovered within two or three hours and is so large that treatment seems desirable, gastric lavage or a suitable dose of ipecacuanha can be used. There are no specific antidotes and further treatment should be symptomatic.

Pharmaceutical precautions Store at, or below, room temperature.

Legal category POM.

Package quantities Trinordiol is supplied in packs of 21 tablets.

Further information Levonorgestrel is a totally synthetic progestogen which possesses no inherent oestrogenicity. It has anti-oestrogenic properties and has minimal effects on metabolic functions.

Research has shown that it is unnecessary to give the same doses of hormones throughout the cycle. The three-phase dosage mimics the secretion of hormones in a natural cycle and allows the total intake of steroids to be reduced while maintaining contraceptive efficacy and good cycle control.

Product licence number 0011/0066.

***Trade Mark**

Zyma (United Kingdom) Limited

Westhead

10 West Street

Alderley Edge

Cheshire SK9 7XP

FENOSTIL*

Presentation *Fenostil-Retard Tablets*: Round, biconvex, greyish-white in colour, stamped on one face with the Zyma logo and on the reverse with the initials KA: diameter 9 mm, thickness 4.4 mm. Each tablet contains 2.5 mg dimethindene maleate in an inert slow release matrix.

Uses Antihistamine.

Indicated for allergic conditions including hay fever, allergic rhinitis, urticaria, allergic dermatoses and pruritus.

Dosage and administration For oral administration.

Adults: 1 tablet, swallowed whole, morning and evening.

Children: No formulation of a dose suitable for children is available.

Contra-indications, warnings, etc There are no known contra-indications.

Warnings: May cause drowsiness: if affected do not drive or operate machinery. Avoid alcoholic drink.

In keeping with current medical practice, use during pregnancy should be avoided unless considered essential by a physician.

Treatment of overdose: There is no specific antidote to Fenostil. Immediate treatment consists of forced emesis followed by gastric lavage with luke-warm water and instillation of approximately 10 g activated charcoal and 20–30 g sodium sulphate dissolved in water. Should convulsions or hypertonicity occur these may be treated with diazepam or phenobarbitone injection. Severe respiratory depression may necessitate mechanical respiration.

Pharmaceutical precautions Store in a cool, dry place protected from light.

Legal category P.

Package quantities Containers of 100.

Further information Pharmacological studies show Fenostil to have a specific, potent, antihistaminic activity with low toxicity, long duration of action and one of the highest reported therapeutic ratios for an antihistaminic substance.

Product licence number 0030/5000.

ISMELIN* EYE DROPS

Presentation A clear colourless odourless solution containing guanethidine sulphate 5% w/v., with benzalkonium chloride BP as a preservative.

Uses Mode of Action.

The precise mechanism of action of Ismelin in reducing intra-ocular tension has not yet been fully determined,

but a working hypothesis could be envisaged in which the therapeutic benefits are mediated by a local effect on the release of catecholamines, particularly those involved in the transmission of sympathetic impulses from terminal nerve fibres to target organs. This would be in line with the generally accepted concept of Ismelin activity in anti-hypertensive therapy. In relation to the eye one would have to postulate that to a greater or lesser extent the following ocular conditions are related to sympathetic overactivity: exophthalmos, lid retraction and lid lag in thyrotoxicosis, and secretion of aqueous humor in glaucoma.

Indications:

The reduction of intra-ocular pressure in glaucoma of the open angle type.

The treatment of exophthalmos and lid retraction caused by endocrine imbalance.

Dosage and administration Ismelin eye drops are intended for local administration to the eye.

Dosage: Exophthalmos and lid retraction: Initially one drop twice daily for at least one week, reducing thereafter to one drop daily. The dosage should be reduced as soon as possible to the minimum required to maintain the initial response – one drop on alternate days may be adequate.

Open angle glaucoma: Initially one drop twice daily for at least a week. Dosage should then be adjusted according to the patient's needs, which may be one drop once or twice daily, or if necessary two drops once or twice daily, but rarely in excess of this.

Contra-indications, warnings, etc *Contra-indications*: Use in narrow angle glaucoma or in patients with a shallow anterior chamber. Hypersensitivity to any of the components of the formulation. Ismelin Eye Drops should not be used during or within 14 days of treatment with a monoamine oxidase inhibitor.

Precautions: Soft contact lenses (hydrophilic lenses) should not be worn during treatment with Ismelin Eye Drops.

Side-effects: Conjunctival vasodilation is regarded as a pharmacological side effect of Ismelin, but does not generally prove troublesome at the recommended dosage. Hyperaemia with discomfort is usually a sign of overdose. Some degree of ptosis, valuable in the management of exophthalmos, may represent an adverse effect in glaucoma but will usually respond to a reduction in dosage or frequency of administration. The slight myosis which occurs in most cases during Ismelin treatment causes little or no inconvenience and accommodation is not usually affected. At prolonged high dosage a tendency to superficial punctate keratitis has been reported, responding either to a reduction in dosage or interruption of treatment.

No systemic effects have been reported with Ismelin eye drops, even at maximum dosage.

Pharmaceutical precautions Store in a cool place.

Do not exceed the stated dose.

The drops should not be used later than one month after first breaking the seal.

Legal category POM.

Package quantities Ismelin eye drops 5 ml.

Further information The results of therapy with Ismelin eye drops have been in many cases dramatic, particularly in terms of cosmetic improvement of the unsightly eye manifestations such as lid retraction, lid lag and exophthalmos, which occur in a high proportion of patients with thyrotoxicosis.

There is minimal local irritation when the eye drops are used carefully according to the recommended dosage. Also considerable subjective relief of symptoms has been afforded even when the reduction in physical signs has been minimal.

Product licence number 0030/5901.

OTRIVINE-ANTISTIN* STERILE EYE DROPS

Presentation A clear colourless odourless solution containing xylometazoline hydrochloride 0.05% w/v and antazoline sulphate 0.5% w/v, with benzalkonium chloride BP as a preservative.

Uses Otrivine-Antistin is a combination of a long acting vaso-constrictor and an antihistamine. The eye drops are suitable for use in the relief of conjunctivitis associated with seasonal and perennial allergies, such as hay fever, and in all non-infective conditions of the conjunctiva, such as irritation caused by smoke or dust, or following the removal of foreign bodies.

Dosage and administration This preparation is intended for local administration to the eye.

Dosage: 1 or 2 drops instilled 2-3 times per day into the conjunctival sac will be found to be effective. Mydriatics and miotics may be administered simultaneously with Otrivine-Antistin Eye Drops when necessary.

Contra-indications, warnings, etc *Contra-indications:* Hypersensitivity to any of the components of the formulation. Presence of narrow angle glaucoma. Otrivine-Antistin Eye Drops should not be used during or within 14 days of treatment with a monoamine oxidase inhibitor.

Precautions: Use with caution in the presence of hypertension, cardiac irregularities, hyperthyroidism or hyperglycaemia (diabetes). Rebound congestion may follow prolonged frequent use. Soft contact lenses (hydrophilic lenses) should not be worn during treatment with Otrivine-Antistin Eye Drops. Inflammation arising from infection should receive appropriate antibacterial therapy.

Side effects: Both Otrivine and Antistin are well tolerated in the eye and for the majority of patients will be non-irritant, but in a few cases, however, slight transient local stinging may occur. Other side effects which may occur include headache, insomnia, drowsiness and in sensitive patients, tachycardia.

Pharmaceutical precautions Store in a cool place.

The drops should not be used later than one month after first breaking the seal.

Legal category P.

Package quantities Otrivine-Antistin Sterile Eye Drops 10 ml.

Further information Nil.

Product licence number 0030/5900.

PAROVEN*

Presentation Greyish-yellow, opaque, hard gelatin capsule (size No. 2) imprinted 'Paroven Zyma'. Each capsule contains 250 mg 0-(β -hydroxyethyl)-rutosides.

Uses Paroven improves capillary function by reducing abnormal leakage, probably by maintaining the integrity of endothelial cell junctions. Improved tissue perfusion increases the O₂ content of venous blood.

For long-term relief of the symptoms of capillary impairment (fragility and permeability) associated with venous insufficiency, especially of the lower limb, for example painful heavy tired legs, night cramps, paraesthesia, restless legs, ankle oedema, varicose states with or without ulceration, post-phlebitic syndrome. Haemorrhoids.

Dosage and administration For oral administration.

Adults: Initially 3-4 capsules per day. This dosage may be reduced as improvement occurs. The capsules are best taken at mealtimes.

Children: No known indication; therefore not recommended for children.

Contra-indications, warnings, etc There are no known contra-indications.

Side-effects: Minor complaints such as slight gastrointestinal upsets, flushes and headaches have been reported, although in most trials authors remarked on freedom from side-effects.

Precautions: Teratogenic studies in animals have revealed no adverse effects. However, in keeping with current medical practice, the use of Paroven during the first trimester of pregnancy should be avoided.

Pharmaceutical precautions No special storage requirements.

Legal category P.

Package quantities Containers of 100 capsules.

Further information Nil.

Product licence number 0030/5002.

TANDERIL* EYE OINTMENT

Presentation A white to yellowish-white soft ointment, containing 10% Oxyphebutazone BP as active ingredient and phenyl ethyl alcohol 0.5% as a preservative in a special paraffin base.

Uses Anti-inflammatory: Disease of the anterior segment of the eye and conjunctival sac: Blepharitis, conjunctivitis, kerato-conjunctivitis, episcleritis, keratitis and disease of the anterior uveal tract.

Inflammation following trauma:

Traumatic injury, penetrating and non-penetrating.

Post Operative:

Following cataract, squint or other surgical procedures.

Note: Herpes Simplex:

While Tanderil eye ointment is not recommended for the treatment of a simple dendritic ulcer it may prove particularly valuable in treating other stages of the disease which may develop, e.g. metaherpetic ulcer, disciform keratitis or anterior uveitis. In view of the serious nature of this disease, it is recommended that these patients be under close medical supervision and if necessary additional therapy be instituted.

Dosage and administration Apply to the affected eye two to five times a day.

Contra-indications, warnings, etc *Contra-indications:* Previous local or systemic sensitivity to pyrazole compounds such as phenylbutazone and oxyphenbutazone.

Side-effects: Intolerance to the eye ointment may develop after continued use, the signs being: oedema of the eyelid, epiphora (minimal), redness of the palpebral and bulbar conjunctiva.

Precautions: In the treatment of purulent inflammatory eye conditions, appropriate anti-infective therapy should be given concurrently with Tanderil eye ointment.

Although there is no evidence that Tanderil eye ointment increases intra-ocular pressure, it should be used with caution in cases of glaucoma secondary to injury or infection.

While application of Tanderil eye ointment results in adequate concentrations of Tanderil in the anterior part of the globe, to ensure maximum therapeutic effectiveness in the treatment of conditions involving the posterior uveal tract, retina or choroid, it is recommended that Tanderil be given systemically either alone or in combination with local application of the ointment.

Pharmaceutical precautions Store in a cool place.

Use within one month of opening the tube.

Dilutants to this formulation are not recommended.

Legal category POM.

Package quantities Ophthalmic tubes of 5 g.

Further information Experimental studies confirm that following local application of the ointment to the eye, Tanderil penetrates the corneoscleral barrier and is present in therapeutic concentrations in the aqueous humor, iris and ciliary body.

In therapeutic concentrations Tanderil does not affect lens metabolism, intra-ocular pressure in the normal eye or in latent glaucoma, nor does it impede tissue healing or promote cataract formation.

Furthermore, in contrast to the anti-inflammatory corticosteroids, Tanderil does not enhance viral replication or the invasiveness of bacterial pathogens.

Product licence number 0030/0017.

TANDERIL* CHLORAMPHENICOL EYE OINTMENT

Presentation A white to yellowish white soft ointment containing 10% Oxyphenbutazone BP and 1% Chloramphenicol BP as active ingredients and phenyl ethyl alcohol 0.5% as a preservative.

Uses Anti-inflammatory and antibacterial.

Disease of the anterior segment of the eye and conjunctival sac: blepharitis, conjunctivitis, episcleritis, keratitis and disease of the anterior uveal tract.

Inflammation of the eye following trauma and prophylaxis of secondary bacterial infection.

Post Operative:

Following squint, cataract or other surgical procedures

Note: Herpes Simplex:

The ointment is not contraindicated in the treatment of simple dendritic ulcer, but in view of the serious nature of this disease it is recommended that these patients be under close medical supervision and the necessary additional therapy be instituted.

Dosage and administration Apply to the inner surfaces of the lower lid of the affected eye two to five times daily.

Contra-indications, warnings, etc *Contra-indications:* Previous local or systemic sensitivity to pyrazole compounds such as phenylbutazone and oxyphenbutazone. Sensitivity to chloramphenicol.

Side-effects: Intolerance to the eye ointment may develop after continued use, the signs being: oedema of the eyelid, epiphora (minimal), redness of the palpebra and bulbar conjunctiva.

Pharmaceutical precautions Store in a cool place.

Use within one month of opening the tube.

Legal category POM.

Package quantities Ophthalmic tubes of 5 g.

Product licence number 0030/0018.

VIBROCIL*

Presentation *Nasal Spray and Nasal Drops:* A clear colourless solution with slight odour of lavender. Each 100 ml of solution contains:

Dimethindene maleate	0.025 g
Phenylephrine base	0.250 g
Neomycin sulphate	0.350 g

Nasal Gel: A colourless gel with slight odour of lavender. Each 100 g of Nasal Gel contains:

Dimethindene maleate	0.025 g
Phenylephrine base	0.250 g
Neomycin sulphate	0.350 g

Uses For common colds, acute and chronic rhinitis, allergic and vasomotor rhinitis, pollenosis (hay fever), acute and chronic sinusitis in children and adults.

Vibrocil does not interfere with the activity of the cilia.

Dosage and administration For topical application to the nasal mucosa.

Spray: Adults: 3 sprays in each nostril three to four times a day. For children the use of Drops or Gel is recommended.

Drops: Infants and children under six years: 1-2 drops in each nostril three to four times a day.

Children over six and adults: 3-4 drops in each nostril three to four times a day.

Gel: Apply a small quantity as high up the nostril as possible.

Adults: Use three to four times a day.

Children: Two to three times a day.

Contra-indications, warnings, etc Hypersensitivity to neomycin. Concurrent use in patients who are receiving monoamine oxidase inhibitors or have received them in the previous 14 days.

Precautions: The following precautions concerning the constituents should be noted:

Prolonged use of neomycin may result in the development of super-infection due to organisms, including fungi, resistant to neomycin. Neomycin may be toxic if absorbed from extensive open surfaces when symptoms of nephrotoxicity and ototoxicity could occur, particularly in patients with impaired renal function. Phenylephrine should be used with caution in patients with hypertension, cardiovascular disease or thyrotoxicosis; prolonged or excessive use may induce tachyphylaxis and rebound congestion.

Dimethindene maleate has potent antihistamine activity with low toxicity and a high therapeutic ratio but the possibility of drowsiness, as with other antihistamines in hypersensitive patients should be observed. If affected, the patient should not drive or operate machinery. Avoid alcoholic drink.

Side-effects: Vibrocil is very well tolerated and does not interfere with the activity of the nasal cilia.

Pharmaceutical precautions Store in a cool dry place protected from light.

Legal category POM.

Package quantities *Spray:* 10 ml nebulisers – plastic.

Drops: 15 ml amber dropper bottles with plastic screw cap.

Gel: 12 g in aluminium printed tubes with lacquered interior.

Further information Nil.

Spray 0030/5009

Drops 0030/5010

ZYMAFLUOR*

Presentation *Zymafluor 1.0 mg:* Round, bi-convex tablets with bevelled edge, greyish-yellow in colour, diameter 5 mm, thickness 2.1 mm. Each tablet contains 2.21 mg sodium fluoride equivalent to 1 mg available fluorine.

Zymafluor 0.25 mg: Round, bi-convex, white tablets, slightly sweet to the taste with odour of peppermint, diameter 4.0 mm, thickness 2.6 mm. Each tablet contains 0.55 mg sodium fluoride equivalent to 0.25 mg available fluorine.

Uses Prophylaxis of dental caries. Fluorine enhances the resistance of teeth to carious decay. The protective action of fluorine is due especially to its accumulation in the outer layers of the dental enamel. This process should begin before eruption of the teeth and continue for a long time afterwards.

Before eruption. Zymafluor when swallowed is carried

to the developing teeth by the blood stream and thus permits effective pre-eruptive fluoridation. After their eruption the teeth take up fluorine both by internal channels and especially by way of direct contact with the fluorine contained in the saliva. Zymafluor Tablets should thus not be swallowed whole: it is extremely important that they be allowed to dissolve slowly in the mouth.

Dosage and administration For oral administration. Not to be taken except on the advice of a dentist, doctor or pharmacist. Zymafluor should be given regularly, without interruption, from birth until about 16 years.

Intake of Zymafluor during pregnancy and feeding will protect the mother's teeth and lay down optimum conditions for a resistant set of milk teeth in her infant.

As soon as the age of the child permits, Zymafluor Tablets should no longer be swallowed, but sucked slowly in the mouth, between the cheek and gum, sometimes on the left and sometimes on the right side. They are best taken in the evening before bedtime. For smaller infants 1 tablet should be crushed and dissolved in a little boiled and cooled water and added to one bottle or solid meal a day, or administered alone.

Zymafluor 0.25 mg: If not otherwise prescribed by the doctor or dentist.

From birth to two years of age: 1 tablet daily.

From two to four years: 2 tablets daily.

From four to five years: 3 tablets daily.

After the age of 5 years Zymafluor is best administered in the form of 1 mg tablets.

Zymafluor 1.0 mg: From the age of 5 years, adults and pregnant women: 1 tablet daily or as prescribed by the doctor or dentist.

Contra-indications, warnings, etc There are no known contra-indications.

Precautions: It is unnecessary to take these tablets in areas where there is fluoridation of the drinking water supplies.

Pharmaceutical precautions Store in a cool dry place.

Legal category P.

Package quantities *0.25 mg strength:* Packs of 400.
1.0 mg strength: Packs of 100.

Further information Nil.

Product licence numbers

0.25 mg strength 0030/5011

1.0 mg strength 0030/5012

*Trade Mark

The reporting of adverse reactions

One of the functions of the Committee on Safety of Medicines is to collect and study reports of adverse reactions to medicines. All doctors and dentists in the United Kingdom are encouraged to report toxicity or side-effects that they observe or suspect.

Certain products which are marked ▼ are recent introductions, and doctors are therefore particularly requested to report details of all suspected adverse reactions to the Committee on Safety of Medicines, preferably on the yellow card issued by the Committee. They are asked to continue to report serious or unusual reactions to all other products.

Even incomplete reports can be helpful and practitioners should not be deterred from reporting because some details are not known.

Special postage-paid forms ('yellow cards') are provided for reports. Supplies of these can be obtained from the Committee at Market Towers, 1 Nine Elms Lane, London SW8 5NQ, telephone 01-720 2188.

The above statement and the symbols marking certain products have been included in the Compendium at the request of the Medicines Division of the Department of Health and Social Security.

The individual companies concerned would find it helpful to be informed by practitioners of any adverse reactions to their products which are reported.

Physiological Values for some Body Fluids

This information concerning physiological values for certain body fluids is reproduced, by permission, from the *Pharmaceutical Handbook*, Nineteenth Edition, The Pharmaceutical Press, London, 1980.

The values given in the following pages have been taken from many sources and represent approximate normal ranges or typical normal values. In practice 'normal' values can vary considerably from laboratory to laboratory depending on the reagents and analytical methods used. Therefore when evaluating the results of laboratory tests the normal values from the laboratory which performed the test should be consulted.

Many factors affect the reliability of laboratory tests. The specimen must be withdrawn and stored in the correct manner, an appropriate preservative being used if necessary. Certain values fluctuate in every person according to diurnal, nocturnal, or seasonal influences. Other factors, such as exercise, posture, stress, or emotional disturbances, and the age and sex of the patient may also influence the results of laboratory tests.

Many drugs and foods can interfere with laboratory tests. This interference may be physical, chemical, or pharmacological. Dyes may interfere with colorimetric or spectrometric determinations. For example, ingestion of carrots, riboflavin, or foods containing yellow pigment prior to withdrawal of a sample will elevate estimates of total bilirubin in plasma. Many chemicals can cause test results to appear abnormally high or low. High values for catecholamines in urine may be obtained if the patient is taking drugs such as methyl dopa. The pharmacological effects of drugs may interfere with laboratory test results. Antihistamines interfere with tests for allergies and mask hypersensitivities.

In the following tables these abbreviations are used: B = Blood; P = Plasma; S = Serum.

BLOOD

Physical Values

Circulation time	3 to 8 seconds (arm to lung)
Freezing-point	-0.52°
Osmolality, plasma	280 to 295 mmol per kg
pH, arterial	7.35 to 7.45
Pressure, arterial	
Systolic	< 140 mmHg
Diastolic	< 90 mm Hg
Specific gravity	1.05 to 1.06
Volume, blood	50 to 80 ml per kg body-weight
Volume, plasma	31 to 55 ml per kg body-weight

Haematological Values

Blood count, complete	
Haematocrit (Packed cell volume)	Male: 40 to 54% Female: 35 to 47%
Haemoglobin	Male: 13 to 18 g per 100 ml Female: 12 to 16 g per 100 ml
Red cell count	Male: 4.5 to 6.5 million per mm ³ or 4.5 to 6.5 × 10 ¹² per litre Female: 3.9 to 5.6 million per mm ³ or 3.9 to 5.6 × 10 ¹² per litre 4000 to 11 000 per mm ³
White cell count	
Coagulation tests	
Bleeding time	
Duke's method	< 7 minutes
Ivy method	< 7 minutes
Clotting time, Lee White method	5 to 11 minutes
Partial thromboplastin time, activated	35 to 60 seconds
Prothrombin time, Quick one stage	12 to 20 seconds
Erythrocyte sedimentation rate (ESR), Westergren method	Male: 3 to 5 mm in 1 hour Female: 4 to 7 mm in 1 hour
Haemoglobin A ₂	1.5 to 3.5%
Haemoglobin F	< 2%
Haptoglobin	0.3 to 2.0 g per litre
Platelet count	150 000 to 400 000 per mm ³ or per µl
Red cell diameter	6.7 to 7.7 µm average 7.2 µm
Red cell thickness	1.7 to 2.5 µm
Red cell volume	23 to 35 ml per kg body-weight
Reticulocyte count	0.5 to 2.0% of red cells
White cell count, differential	
Neutrophils, segmented	2500 to 7500 per mm ³ or per µl
Lymphocytes	1500 to 3500 per mm ³ or per µl
Monocytes	200 to 800 per mm ³ or per µl
Eosinophils	40 to 440 per mm ³ or per µl
Basophils	15 to 100 per mm ³ or per µl

Oxalate	15 to 40 mg per 24 h	167 to 444 μ mol per 24 h
Phosphate, inorganic	0.5 to 1.5 g per 24 h	16 to 48 μ mol per 24 h
Potassium	1.4 to 3.5 g per 24 h	35 to 90 mmol per 24 h
Protein	< 100 mg per 24 h	—
Urea	10 to 30 g per 24 h	167 to 500 mmol per 24 h
Uric acid, normal diet	0.2 to 0.5 g per 24 h	1.2 to 3 mmol per 24 h
high purine diet	up to 2 g per 24 h	up to 12 mmol per 24 h
Vanillylmandelic acid (VMA)	up to 9 mg per 24 h	up to 45 μ mol per 24 h

Clearance Values*Serum and Urine*

Aminohippuric acid (PAH) clearance	600 to 750 ml per min
Creatinine clearance (endogenous)	95 to 135 ml per min
Inulin clearance	100 to 150 ml per min
Urea clearance	
average standard	41 to 65 ml per min
average maximum	64 to 99 ml per min

'Desirable' Weights for Men and Women

'Desirable' weights for men and women according to height and frame. Ages 25 and over. USA.

Source: Metropolitan Life Insurance Co. (1960)

MEN. Weight in pounds (in indoor clothing).

<i>Height (in shoes)</i>	<i>Small frame</i>	<i>Medium frame</i>	<i>Large frame</i>
5 ft. 2 in.	112 – 120	118 – 129	126 – 141
5 ft. 3 in.	115 – 123	121 – 133	129 – 144
5 ft. 4 in.	118 – 126	124 – 136	132 – 148
5 ft. 5 in.	121 – 129	127 – 139	135 – 152
5 ft. 6 in.	124 – 133	130 – 143	138 – 156
5 ft. 7 in.	128 – 137	134 – 147	142 – 161
5 ft. 8 in.	132 – 141	138 – 152	147 – 166
5 ft. 9 in.	136 – 145	142 – 156	151 – 170
5 ft. 10 in.	140 – 150	146 – 160	155 – 174

New Products

The following names appear in the index to this issue of the Compendium but did not appear in the 1981-82 edition. It does not necessarily follow that they are recently introduced products.

Abicol 200	Glykola 1186	Opulets Benoxinate 38
Albuminar 77	H-B Vax 837	Opulets Chloramphenicol 38
Alcoderm 40	Healonid 987	Opulets Cyclopentolate 38
Alexan 959	Hexabrix 707	Opulets Fluorescein Sodium 39
Alpha Keri Bath Oil 226	Histoacryl 327	Opulets Sodium Chloride 39
Aluhyde 1183	Human Actrapid 895	Orimeten 294
Antepsin 107	Human Monotard 895	Oruvail 718
Intraderm 241	Hydrenox 207	Ossopan 588
Aspin 71	Hydrocortistab 207	Ovol 1001
Aspoxolox 73	Hyprenan 99	
Attenuvax 835		Pabrinex 944
		Pendramine 753
Benzalip 730	Ichthaband 1181	Percutol 1012
Biliscopin 1138	Inderex 526	Pipril 620
Bi-Novum 925	Isoket 1127	Polytrim 1398
Bronchodil 571		Psorox 414
		Pyralvex 882
Calaband 1181	Kemicetine 399	
Caplenal 171	Kiel Bone Graft 328	Quinaband 1181
Caprin 1183		
Cardgut, Surgical (D + G) 328	Lacri-Lube 66	Rabro 1189
Centrax 1340	Lasilactone 487	Regulan 1173
Chelac 172	Ledclair 1187	Rohypnol 1133
Chlirvan 1183	Lexotan 1062	
Chongesteze 574	Limclair 1187	Secadrex 721
Choparvax 260	Litarex 1366	Soft Gut 328
Chloro-Pyronil 646	Lyodura 328	Sorbichew 1277
Chlorogaretic 1226		Spectragen 993
Chortistab 202	Manusept 503	Stabillin V-K 220
Chyprostat 1141	Marvelon 904	Surgam 280
	Meditar 249	Suscald 1004
Cheltastab 202	Merocaine 827	
Chelon 327	MFV Ject 1177	Tarband 1182
Chlartensec 1165	Microlet 111	Tenoret 1280
Chlimercaprol 204	Minims Gentamicin 1194	Theo-Dur 415
Chlovol 999	Minims Prednisolone Sodium	Tigason 1083
Chloriclor 1270	Phosphate 1196	Tinset 557
	Mitomycin-C Kyowa 693	Tonocard 100
Chlantan 1127	Monaspor 291	Tosmilin 1189
Chlulsiderm 335	Motilium 552	Travogyn 572
Chlifoam 1252	Mucoclex 1343	Triludan 834
Chl.S.T.P. 691	Mustine Hydrochloride 209	
Chlsterol 336	Myelobromol 1188	Valrelease 1087
		Varbian 309
Chl.abrol 423	Niopam 747	Vepesid 239
Chl.actorate 86	Nitrolingual Spray 675	Vinblastine 626
Chl.arlital 397	Noctamid 1151	Vincristine 627
Chl.erfolic 1184	Nodilon 180	Visclair 1190
Chl.erglucite 1185	Norflex 1024	
Chl.losint 398	Nolvadex 530	Zantac 480
Chl.uramide 206	Novagard 1170	Zelmid 105
	Nozinan 715	Zenoderm 385
Chl.i.500 323		Zincaband 1182
Chl.iammabulin 505	Ocusol 212	Zovirax 1412
Chl.ientigan 744	Opulets Atropine 38

Non-proprietary/Proprietary Names Index

This index of non-proprietary names is provided to enable users of the Compendium to identify the brand names of relevant products when only non-proprietary names are known.

It should be noted that although different products may contain the same active ingredient this does not imply that they are equivalent in regard to bio-availability or therapeutic activity.

Some products contain a number of ingredients and it has not been possible in every instance to identify such products by a reference in this index to each ingredient.

** Products with an asterisk contain a number of active ingredients and may be available in more than one formulation.*

Products without an asterisk contain a single active ingredient; in certain instances such products may also be available with added constituents and these formulations are often designated by the principal brand name with the addition of a suffix or other mark of distinction.

Where a number of presentations of a product bear the same proprietary name, the page number given below is that of the first of the respective entries.

Non-proprietary name in bold type Proprietary name in ordinary type

- Acebutolol**
- Sectral 722
- Secadrex* 721
- Acetifylline**
- Etophylate 331
- Acetarsol**
- SVC 727
- Pyorex* 164
- Acetazolamide**
- Diamox 604
- Acetic Acid**
- Acijel 925
- Acetohexamide**
- Dimelor 648
- Acetomenaphthone**
- Pernivit* 370
